There has been a shift in the upper-caste workers' attitude towards Harijan colleagues at the level of the community as well, although relations in the community are not as equalitarian as in the *mill and the union. Social intercourse* across the barrier of untouchability has come to stay, even though in a limited way. Where there is a marriage in a Harijan household, clean caste workers are invited and usually attend. But upper-caste workers generally stop short of eating the food cooked in Harijan houses. The host himself would not offer the food cooked in his home. Eatables would generally be brought from a hotel and served. Older workers are more rigid about not eating food cooked in Harijan homes than the younger ones. But the barrier of commensality has been broken by the activists. They freely eat in Harijan homes. As a union leader put it, "All I ask for is cleanliness. We do not discriminate against our Harijan friends". It is *noteworthy that emphasis is now shifting*, from considering the Harijans as polluting, to considering them as unclean. Those who are willing to socially interact with Harijans as well as those who are unwilling for such interaction stress hygiene as a crucial determinant. *However for the unwilling category*, the stress on cleanliness is merely a smokescreen to justify their reluctance. That they need such justification instead of simply defining the Harijans as polluting is itself a major change.

While all this signifies a change in the status of Harijans, there is an underlying antagonism between them and the upper castes. Both of them labour under prejudices. Although Harijans are to be found at all levels in the mills, they still allege that they are discriminated against in the matter of recruitment. They contend that, even a retiring Harijan cannot fix his *warisu* in his mill.[7] An analysis of recruitment in one mill reveals that the enrolment of Harijans has come down in the past 15 years. But this is not binding evidence of discrimination against Harijans. Everyone knows that powerful recommendation is necessary to get into a mill. Recommendation is necessary even for the recruitment of one's *warisu*. The declining recruitment of Harijans may just as well indicate that they do not have sufficient leverage.

The Chakkiliar feel that their plight is worse than that of Pallar and Parayar. A Chakkiliar leader remarked, "It is difficult to hide one's caste identity at the time of recruitment. They either ask your caste or it is known already. Even today, our caste people have to please the jobber to get a mill job. They have to go to the jobber's home and perform all kinds of chores to please him."

Harijans also contend that there is discrimination in the matter of promotion to supervisory positions. This question is complicated by the inability of some Harijans to take work out of others. An upper-caste union leader commented: "Harijans do face the problem of job mobility in the mill. A Harijan can go up to the level of reserve piecer, and with difficulty become an oiler. There are some Harijan jobbers, but they are few and far between. It is difficult for a Harijan to take work out of upper-caste workers. One of the mills had refused to promote a Parayar worker as oiler. I fought for this man and got him the promotion. But he is unable to get others to do the work."

A Chakkiliar worker, himself a jobber, explained that the ability of a *Harijan to hold supervisory positions* depended on two factors. If the supervisor insisted that the jobber must be obeyed, no matter what his caste, there would be no problem. The second factor is the self-confidence of the Harijan. He attributed his own confidence to his union and party affiliation. He had been a union and party activist for three decades and this helped him to face others on a footing of equality.

The Harijans argue that there is more discrimination in the union than in the factory. Although Harijan leaders exist, the climb for them is a difficult one. Most people resent being led by Harijans. There are various ways of keeping them out of leadership. A Chakkiliar local leader contended that others would just not vote for a Harijan when

there is a contest. He cited the instance of elections to the executive committee of his union to prove his point. Thirty-seven candidates contested for the 15 positions on the executive committee. He and another Harijan were among the contestants. He did not get enough votes and lost. He pointed out that on such occasions people normally vote for a known person. He had been a union activist for decades, and certainly he was not unknown. He could not but conclude that he lost because of his caste. When I raised this question with the secretary of the union, he denied this charge. He pointed out that a Parayar had been one of the successful contestants in the same elections. The Chakkiliar's defeat could not be attributed to his caste. It was simply that he was not popular enough.

Harijans claim they face the maximum discrimination at the residential end. It is extermely difficult for them to find a house in an upper-caste neighbourhood. It is worth recalling that there are only two Harijan households in Tyagipuram, and both of them are of Pallar. It is extremely doubtful if the lowly Chakkiliar will be allowed to live there. A Chakkiliar leader alleged that when the co-operative society was floated to build Tyagipuram, two of his caste-men from the neighbouring slum applied for house sites. Neither of them was enrolled in the Society.

When I raised this question with a prominent union leader who was closely associated with the construction of Tyagipuram, he replied that he could not clearly recall what happened. But he would not put it past the men who were then in charge of the Society's affairs to turn down the request of the Chakkiliar. In the communal affairs of Tyagipuram, such as the Mariamman festival the Pallars are assigned the least consequential jobs.

The Harijans, too, have projected a distinct and not too favourable image of themselves in the community. For example most people avoid Pallar because of their allegedly violent ways. Upper caste workers often refer to a recent incident to show how ruffian-like the Pallar can be. One young Pallar bully terrorised the entire area for several years. He was so courageous that even the local *pahelwan* was not a match for him. He was in particular a threat to the Gounders. He had threatened to abduct the daughter of one Gounder watchman in a mill. One day he came drunk with half a dozen other Pallar youth with the intention of creating trouble. The Gounder who had been prepared for this eventuality speared the Pallar bully to deah in broad daylight in front of the mill gate. The case went up to the high court, but the watchman could not be convicted because no one would give evidence against him. Even to this day the upper castes wholeheartedly justify the revenge taken upon the Pallar.

• Within Tyagipuram itself, the relations between the two Pallar households and the rest of the community have been far from cordial. A vacant plot under the control of Tyagipuram Co-operative Society was informally being used as a gymnasium Young boys from all castes were associated with it. Through an uncertain process, it came to be gradually monopolised by the Pallar. The six boys from the two Pallar households in Tyagipuram gained firm control over the gymnasium and started to bring their caste friends from the neighbouring *cheris* The residents resented the frequent visits by outside Pallar.

To scuttle possible eviction from the gymnasium by the upper castes, the Pallar thought of a strategem. They decided to put up a statue of N G Ramaswamy, the man who gave his life for the cause of industrial workers, in front of the gymnasium. N G Ramaswamy was revered by every mill worker, and it was most unlikely that anyone would object to the installation of the statue. They raised contributions from the public and got a statue made. Upper caste boys who saw through the move approached some prominent trade union leaders and argued that no one could install a statue on public land without the consent of the Society. The president of the Society who had all along enjoyed the support of the Pallar, had in the meanwhile become hostile to them. He sent a legal notice to refrain them from installing the statue. The Pallar have tentatively given up their plans but still maintain their hold over the gymnasium. The statue is locked up in a room and the Pallar have made it clear that the Society could install it wherever it wishes. An upper-caste resident acidly remarked: "Look at the avarice of the Pallar. They want to own the gymnasium which is indeed public property. Even my house in this place is not my own after so many years of occupation and payment of monthly instalments."

The reaction of the upper castes to the Pallar is a mixture of fear and avoidance. The Pallar families insisted that the public hydrant should be located in front of their house. An activist admitted that the people gave in to this pressure even though, as per earlier plans, the taps were to have been installed some distance away. The Harijans are suspicious and fearful of the upper castes. A young Uppili Naicker narrated an incident that occurred when he and his friends took a stroll through a Pallar neighbourhood. As they were cracking jokes, some passing Pallar took exception and accused that they were being jeered at. The upper-caste boys quickly left the place for fear of escalating trouble.

The crux of the Harijan question consists in upper-caste prejudice against Harijans and Harijan suspicion of upper caste motives. There are many upper caste leaders who are committed to greater integration of Harijans with the rest of the people. A socialist leader pointed out: "We activists have visited Harijan homes and eaten their food. Harijans visit my home. We have frequent union meetings in my home and Harijans participate. Not all Harijans behave the same way when they come to my home. The Parayar enter the house and sit with me. The Pallar stand near the doorstep. The Chakkiliar refuse to enter. They stand outside and look through the window. This, in spite of my encouraging them to be free with me" The secretary of a union remarked: "We try hard to locate Harijans with leadership qualities and encourage them. We employed the son of a Chakkiliar member in our office. He was a complete failure. One expects some qualities in a person employed in a union office. He should come to office on time and have some respect for the work he is assigned He should also have a modicum of honesty and truthfulness. This boy had none of these qualities. We want to encourage these people to come up. But if they have no initiative and none of the qualities necessary to come up in the union, there is little that we can do."

The relationship between the Scheduled Castes and upper castes is a fluid and changing one. It is difficult to convey precisely all the complexities of this relationship. What is clear is that the Pallar have been the most successful in solving many of the problems arising out of their traditionally defiling status through increased earning from mill employment. The Parayar have moved up through education and government jobs, with their emphasis shifting away from textile mills. It is the Chakkiliar who have been left behind. As a Chakkiliar leader pointed out: "The Pallar

now insist on being called Pannadi, but anyone feels free to call me Chakkili." A Parayar leader distinguished consistently between the Chakkiliar and the other two Harijan castes throughout a long interview. He referred to his own caste as Adi Dravida, and to the Chakkiliar as Harijan. In his view, part of the problem lay with the Harijans themselves. "The Chakkiliar are dirty and this creates a barrier. How can you demand to be treated as an equal unless you yourself are convinced that you are an equal?" The Pallar have lived down their past to the point of moving into upper caste neighbourhoods But in the process they have created a new set of problems. Because of the equal footing enjoyed by the Pallar in the workplace and the consequences resulting from this, the upper castes find it necessary as well as worthwhile to conflict with the Pallar

Politics of Tyagipuram

At home, the worker does not cease to be a worker. The experience gained at the workplace and trade union are not left behind. The Coimbatore mill worker has seen six decades of mill work and over four decades of union activity. Today, there are many second-generation workers. The extension of experience gained in the work world to community life is best illustrated in the politics of the Tyagipuram Co-operative Society. For this reason, I shall describe the politics of the Society in some detail.

Tyagipuram, with 112 houses, was built around 1960 at the instance of TWU leaders. Only mill workers were eligible for membership of the Society and allotment of houses. Most houses were allotted to TWU members. The affairs of the community are managed by the Society, of which each house-owner is a member. The Society is run by a board of seven directors, who are elected annually by the members. The directors elect one from among themselves as president. All house-owners who have paid their monthly instalments towards the cost of the house upto date have the right to vote. The directors hold office for three years, with two retiring every year by rotation.

The presidency of Tyagipuram Society is highly sought after because of the plums of office. Two past presidents are believed to have made money while the houses were being built. In fact, one of them was caught misappropriating funds and hand finally had to pay up the mulcted money to absolve himself. The Society raises contributions to celebrate festivals, and the president is believed to take a cut. Above all, the houses have greatly appreciated in value. Members who sell their houses can make about five times the money they have invested. Many workers are tempted to sell their house in order to start a small business venture or buy land. The sale of a house cannot be effected without the president's signature. The president is believed to make money on house sales.

Tyagipuram Society has had seven presidents so far. The current president, a Gounder, works in a neighbouring mill and is a member of United Textile Labour Association (UTLA). UTLA is a splinter organisation which separated from the TWU in the late sixties. Because of this, there is a near-equal representation of TWU and UTLA members on the Society's board fo directors. Although the TWU has a greater following in this neighbourhood, the presidency has gone to a UTLA man for various reasons.

The story of this man's rise to power reveals the complexity of the politics of the Society which is a mixture of several elements. The members have a wide range of loyalties. They have loyalty to those with whom they work in the same mill. They are also loyal to members of their own union. Activists, in particular, have strong loyalties to each other and to their union. Because of the high politicisation of the community, people also have strong loyalties to the members and sympathisers of the political party they support. There is also loyalty to one's caste-men. On top of all this are factional loyalties. Factions are not independent of the above loyalties, nor are they completely subsumed by any one of them. A feature of factions in Tyagipuram is their constantly changing membership. There are no clear boundaries to the factions, and there can be constant shifting of sides even among those who are active in factional politics. Any shift of loyalty can be justified on the basis of one loyalty or another. In addition to all this is simple opportunism.

The president first managed election to the board of directors with the support of workers from his mill who are well represented in the Society. Since the right to vote depends on prompt payment of instalments, many house-owners who were in arrears could not vote. But the president's work-mates were not thus disenfranchised because the mill deducted the instalments from the wages of the workers. Support for the president from his work-mates for election to the board cut across union, faction and caste ties. When the time came for the seven directors to elect the president, he cleverly used factional divisions to his advantage. There are two important mill-based factions in Tyagipuram. One of them has dominated the Society for a number of years. In 1975, two contestants from this faction lost the election to the board of directors. Following this, the faction feared loss of control over the presidency. In a pre-emptive move this faction backed the present president. One of the reasons underlying this choice was that he belonged to a mill which was marginal to both factions. The president had two other advantages. One was that, as a Gounder, he enjoyed the support of his caste-men on the board of directors. Second, he had the backing of the two Pallars both of whom worked in his mill. Although the Pallars count for only two votes, the significance of their support consists in the community's fear of their aggressiveness.

Ever since the present president assumed office, there has been some talk of Gounders ganging up against Naidus. The Naidus in fact outnumber the Gounders. But the president has been able to keep Naidu members on the board in good humour. He shares with them the spoils of office. Whenever the sale of a house is effected, all the directors are given a drink and dinner party by the president.

The Mariamman festival in 1975, which was the first major communal event after the president took office, further illustrates the complexity of forces underlying the politics of Tyagipuram Society. A festival committee with a president, secretary and treasurer was constituted to raise resources and organise the festival. The festival committee had informally sought the assistance of the president of the Society in managing the festival. The committee raised Rs 2,500 by way of donations, which was beyond all expectations. The president of the Society, taking some liberty in the apportioning of funds, engaged professional dancers to perform on the occasion. The president of the festival committee had not been consulted about this. Upset by this, he instigated those who carry ritual offerings to demand new clothes which are traditionally due to them. The president of the Society, who could not meet this demand, retorted by asking his Pallar followers to play it

rough. A scuffle ensued. Upon this the president of the festival committee slipped to the nearby police station and gave a complaint. The festival had to be concluded with poilce help. It is interesting that the president of the Society as well as of the festival committee were in the same faction at the time of the festival, and have come together once again in spite of all that has occurred. What is more, the president of the Society has fallen apart from the Pallar who have supported him all along. It is evident that there is a constant realignment of forces.

Even though the politics of the Society is complicated by the presence of a number of conflicting loyalties, trade union and caste stand out as the two important forces influencing community affairs. I have already referred at several places to the importance of caste ties. But it needs to be emphasised that the force of caste affiliation is itself moderated by union loyalty. The union and its leaders play a mediatory role in community affairs. For example, the active members of both the factions in Tyagipuram Society are TWU members. Both factions are keen to maintain the delicate balance of power within the Society rather than fight out each other. They managed to do this by seeking the intervention of the TWU secretary. In 1975, for example, two members had to be elected to the Society's board of directors. Normally, both factions would have put up candidates for both positions. The secretary advised each faction to put up just one candidate so that they could both be elected unopposed.

Workers are constantly consulting union leaders to sort out the problems of Tyagipuram Society. Unlike the TWU, the UTLA has so far not interfered in the politics of the Society. This, in spite of the fact that the secretary of UTLA is a member of the Society and lives in one of the houses. He explained that, even though his members came to him for advice, he kept aloof from Society politics. If he were to interfere actively, there would be an escalation of conflict on union lines between TWU and UTLA supporters. Summing up the relation between union affiliation and social life in the community, this leader pointed out: "There was a time when union rivalries were taken home in all their force. Today, union rivalries are seldom taken home, but union loyalties are. While rival unionists would not clash in the community, nor would they co-operate. It would be easy to criticise the action of the rival unionists as unfair or not in the interests of the community."

Where an entire community owes allegiance to one union, things are far better. Almost everyone in Tyagipuram points to a neighbouring housing society organised by communists as a model worth emulating. The communist organised society has far better civic amenities than Tyagipuram. It is also notably free from strife. The reasons for this must be sought in the homogeneity of union membership in the former.

Caste is not a major principle of social organisation in Tyagipuram. When people speak of caste, the referent is to the diffuse clusters which share a similar ritual status. Caste, understood as a unit of endogamy, has no relevance except for the choice of spouse. Even as a cluster, caste has little place in the daily routine of the worker. In contrast, the worker is in close and constant interaction with his work-mates and union members. Caste may serve to reinforce other kinds of cleavages as it does in the politics of Tyagipuram. Even the great divide between the polluting and non-polluting castes is being replaced by a continuous gradation, where the Parayar take their place after Barber and Washermen. Caste does not emerge as the major determinant of social interaction outside the domestic sphere. There are several forces which help to forge a sense of identity among workers. They share a common past, characterised by economic hardship. They have a common life situation as wage earners. This they are trying to improve through union and political action. There is every reason to believe that the workers are keenly aware of this shared identity.

7 There is an agreement in the Coimbatore textile industry to the effect that the heirs (*warisu*) of retired and retiring workers should be given preference in the matter of recruitment.

Ashok Leyland

ASHOK LEYLAND is reducing the foreign equity participation in its share capital from 59.7 per cent to 51 per cent by offering 49,61,349 equity shares of Rs 5 each at a premium of Rs 3 per share to Indian investors. This is in compliance with a condition stipulated by government of India while granting the company industrial licences for increasing the capacities of commercial vehicles to 10,000 and industrial and and marine engines upto 1,500 per annum. Government has further increased the licensed capacity to 12,500 vehicles in the medium duty range. The company has also undertaken a massive programme of modernisation and replacement of old plant and equipment. All these steps will enable it to achieve production of 15,000 vehicles per annum by 1982. Currently, a product improvement plan is on hand. A better horse-powered engine, a stronger axle on the trucks, and a more modern gear box are being planned to make the product more efficient, economic and comfortable. The company has an impressive past record of earnings and dividends. Production of vehicles touched an all-time record of 10,947 numbers for 1978 and sales were 11,116 numbers. Sales of industrial and marine engines were also at a record level of 1,387 during 1978. Profit after tax of Rs 1.06 crores in 1965 more than trebled to Rs 3.30 crores in 1975 and in 1977 touched an all-time high of Rs 5.37 crores. For the first 10 months of 1978 it is estimated at Rs 5.57 crores. Net worth of the company has risen from Rs 14 crores as on September 30, 1977, to Rs 30.83 crores as at October 28, 1978. The company made its first bonus issue in 1976 in the ratio 1:5 and second one in December 1978 in the proportion 1:2.

Dravidian Movement in Its Pre-Independence Phases

N Ram

The significant feature of the political situation in Tamil Nadu is the existence of the two mass-based and politically powerful organisations — the Dravida Munnetra Kazhagam and the All-India Anna Dravida Munnetra Kazhagam. Working apparently at cross purposes and staking rival claims to have reached the summit of Dravida Iyakkam, *these two streams defy the authoritarian logic inherent in glib condemnations of 'regional forces' and the arrogant advocacy of an allegdly ideal 'two party model' for countries like India. Such a view does not take into account the character of the actual 'parties' in whose interest the 'two-party system' is allowed to function and develop, nor the class forces whose aspirations they express. It also ignores the historical forces which gave rise to such phenomenon as the Dravidian Movement which, for all its weaknesses, inconsistencies and limitations, cannot be summarily dismissed as being antagonistic to an 'all-India' approach whose ideal political expression is alleged to be found in a 'two-party system'.*

This article attempts a political explanation of the complex of historical forces that were working in the second half of the 19th century and which gave rise to the Dravidian Movement.

THE very existence of the two mass-based, vigorously kicking political organisation — the All-India Anna Dravida Munnetra Kazhagam (AIADMK) and the Dravida Munnetra Kazhagam (DMK) — highlights a significant feature of the political situation in Tamil Nadu. Working apparently at cross-purposes and staking rival claims to have reached the summit of *Dravidar Iyakkam* (or the Dravidian Movement), the two nevertheless together defy the authoritarian logic inherent in the condemning or dismissing of 'regional forces' and in the 'two party model' so lightly and arrogantly advocated for India.

In whose interests do the two parties function and develop? What are the social and class forces whose aspirations they express? And in what direction are they tending? To answer these questions, a historical analysis becomes necessary of the complex forces working in the second half of the nineteenth century and through the twentieth century.

Such a perspective would demonstrate — as we hope to do in a preliminery fashion in this paper — that the complex historical phenomenon known as the *Dravidar Iyakkam,* for all its limitedness, inconsistencies, and weaknesses, cannot be treated patronisingly by those advocating an all-India approach. What is needed is a many-sided political explanation of an essentially political phenomenon.

To deal with the state's ruling party first, it must be recognised that the explanations most frequently advanced in academic and journalistic analyses for the rapid rise and electoral success of the party led by M G Ramachandran fall into the trap of dismissivism. There is either a one-sided and exaggerated emphasis on the role of 'film glamour' supposed to appeal especially to women, or there is the characterisation of the AIADMK as a 'one man party'. Alternatively, of course, there is that sweeping assertion that Tamil Nadu is still in the grip of the forces of 'regionalism' or 'cultural nationalism' or of 'primordial sentiment'.[1]

These various explanations, while they do make contact with certain real aspects of the phenomenon, miss the leading fact: that the AIADMK has inherited the greater part of the committed strength and following of the undivided DMK — which itself was described on the morrow of its founding by one of its publicists as "the latest organisational shape of the Dravidian movement ... the answer to the anxious quest of the Dravidian people for a democratic organism best suited to give adequate expression to their feelings and sentiments, aims and aspirations".[2]

It is an inherent characteristic of politics that numerous and varied components are interwoven into its transforming processes. Consequently, simple-minded or single-term solutions can be rejected out of hand.[3] Nor is it possible to build neat and compact models of political development on the assumption that the advance or decline of the programme of a political party, or the mode of political articulation of a particular class or classes, will be linear or uninterrupted.

Nevertheless, if we — adopting the general method of abstraction — attempt to separate the essential from the inessential, the phenomena as they occur in their most typical form from the disturbing influences, certain characterising features of the *Dravidar Iyakkam,* and in fact of political development in Tamil Nadu become reasonably clarified.

The first fact that becomes quite clear is that the elements comprising this movement have repeatedly asserted themselves well over a century. As for the last decade and a half, the traditional strength of the dominant bourgeois-landlord movement, the Congress, has been steadily eroded by the advance of the political organisation (or organisations) of the *Dravidar Iyakkam,* and this process has so far appeared to be irreversible. The evidence of this is many-sided and impressive. It consists of the directly observable political activity of the major political forces in Tamil Nadu — their slogans, their mass mobilisations, their ideological and political campaigns — in relation to the masses of the people. It consists of their specific activity and impact among industrial and unorganised workers, among students, teachers, middle-class employees and professionals, in the urban areas; and among agricultural labourers and different sections of the peasantry, and other labouring people, in the rural areas. It consists in their ability to organise and rally numbers for their strategy and tactics. It lies in the less easily observable connections with the interests of the exploiters which the two main parties of the *Dravidar Iyakkam* have developed in the course of their evolution. It consists in the evidence provided by the results of consecutive assembly elections, which are summarised in the Table.

The results of the Assembly elections provide a clearer picture of the correla-

TABLE: SALIENT FEATURES OF ELECTORAL CHANGE IN TAMIL NADU AS REFLECTED IN LEGISLATIVE ASSEMBLY ELECTIONS, 1957—1977

Year	Voter Turnout	DMK		AIADMK		Congress		Janata	
	(Per Cent)	Number of Seats	Percentage of Votes	Number of Seats	Percentage of Votes	Number of Seats	Percentage of Votes	Number of Seats	Percentage of Votes
1957	49.33	13	12.80	NA	NA	151	14.30	NA	NA
1962	70.65	50	27.10	NA	NA	139	46.14	NA	NA
1967	76.59	138	40.77	NA	NA	50	41.04	NA	NA
1971	71.83	184	48.58	NA	NA	NA	NA	17	34.99
1977	61.57	48	24.89	130	30.36	29	17.53	10	16.69

Note: NA is Not Applicable. The Congress did not contest any Assembly seat in the 1971 elections, in a deal with the DMK. The seats captured and votes polled by the Congress(O) in 1971 are credited to the Janata on the generally accepted assumption that the Janata Party in Tamil Nadu draws virtually its entire political base from the Congress(O), although it is equally clear that the decline in political strength from the days of Kamaraj is very sharp.

tion of political forces in Tamil Nadu than the results of the parliamentary elections do. The June 1977 results, in particular, allow us to measure the independent electoral strength of the AIADMK and the DMK, in relation to the independent strength of the traditional Congress camp, the then-undivided Congress, and the Janata parties, without the mediation of very temporary and unstable alliance factors. It can be seen clearly that the Dravidian movement has made serious inroads into the main all-India parties of the big bourgeoisie and landlords and also reached past the Congress and other parties, mobilising sizeable sections of hitherto untapped mass support.

LEGITIMACY OF THE TERM, 'DRAVIDAR IYAKKAM'

A legitimate question might arise at this stage: Is there a real-life political animal which can be referred to as the Dravidian movement (or as it was known in an earlier phase and narrower groove, the 'Non-Brahmin Movement')? Is it not an invention by [illegible] academics and ignorant theo[illegible] who look at the surface of the [illegible] merely and go mainly by [illegible] and bookish evidence? The [illegible] is partly no and partly yes.

The 'Dravidar Iya[illegible]' as conceptualised in the main academic studies [illegible] is indeed a creature of the [illegible] political scientist's imagination, [illegible] bookish concept introduced into a situation where the wood is simply asking to be missed for the trees. The tendency to focus on the superficial and to mix up the primary with the secondary, the significant with the trivial, is certainly characteristic of the bulk of these academic studies which are either industrious but unevenly pursued, empirical investigations or extremely abstract and schematic theoretical constructs. This weakness is particularly evident in the two major empirical studies of the movement which tend to conclude that Tamil nationalism is 'cultural nationalism'.[5]

However, since the idea of a *Dravidar Iyakkam* is a real one to both the protagonists and antagonists of the movement, and since an *idea* that takes root among the masses (especially over a whole historical epoch) becomes a *material force*, the term, separated from the misleading and gullible connotations given it by the pioneering Western political scientist, becomes a useful descriptive device to take into account a many-headed and complex social, ideological, and political phenomenon.

ORIGINS AND RISE OF THE DRAVIDIAN MOVEMENT

We propose that any in-depth and theoretically fruitful research into the Dravidian movement can be conducted only if it is *hypothesised* as a complex response to the meeting and working out of the following historical processes: (a) the national awakening in Tamil Nadu as a part of the old Madras Presidency, (b) the inter-linked stirrings (initially spontaneous, later organised to a certain extent) of the masses of the people against caste and class oppression, (c) the 'divide and rule' manoeuvres of British imperialism and its servitors, and (d) the compromising policy of the bourgeois leadership of the freedom movement on social and class issues.

In this paper, we attempt to offer a connected interpretation and a preliminary analysis of the pre-Independence phases of the Dravidian movement, based on the vast volume of empirical research that has been published, even as we draw attention to the gaps in this historical data.

If, by-passing the real historical processes mentioned above, one goes merely by the inward-looking rhetoric and subjective claims of the leaders and publicists of Dravidian 'revivalism', or is swayed by the uncritical condemnation of the movement as sectarian, communal, and even 'anti-national' by the orthodox Congress leaders, there is no hope of comprehending the political phenomenon in a scientific sense. Just as important as comprehending the movement in its different streams is the need to study its different phases.

At the very outset, two misconceptions about the path of modern political development in South India need to be removed: The first is that there was a backwardness and hesitation in participating in the freedom movement; the second is that the freedom struggle as it developed in this region was largely the handiwork of Brahmin interests. These misconceptions — which were originally promoted by astute representatives of the colonial power — have found influential academic support in numerous devious ways.

The impression that South India was a political backwater contributing little to the rising freedom tide in the second half of the nineteenth century has been dispelled by recent empirical research, notably the work of R Suntharalingam. His detailed study[6] attempts to explore the connection between the origins of the different sections of professional and administrative intelligentsia and the nascent (merchant) bourgeoisie, on the one hand, and the articulation of democratic and anti-colonial demands and social reform activity, on the other. Suntharalingam's research, though hampered by the absence of a scientific theoretical framework, explores a field characterised by a vigorous search of

freedom initiated by the professional intelligentsia, divergent attempts at social reforms under pressure of socio-economic and educational changes, and obstacles put in the way of both the freedom movement and social reform by the forces of revivalism and communalism. Noting that the impact of the socio-economic changes imposed by British colonialism was highly uneven, he makes the perceptive observation that caste associations became vehicles for political mobilisation only in the twentieth century, and that this phenomenon arose directly from the failure of an earlier generation of leaders of the freedom movement to resolve tensions generated by the uneven rate of the colonial impact in South India.[7]

Any serious attempt to understand the process of national and democratic awakening in historical perspective must relate its origins to the historical transformation which took place in the early years of the nineteenth century: the process of development of the different peoples of India into nationalities side by side with the beginnings, rise and development of capitalism. The process of nationality formation, which was first evident in the maritime regions of Bengal, Maharashtra, Gujarat and Tamil Nadu, intensified in the second half of the nineteenth century. The emergence of national consciousness, the development of literature in the local languages, and the awakened interest in the historical past were an integral part of this larger process.[8]

Tamil nationalism is sometimes characterised in academic literature as 'cultural nationalism'. We have already seen that Marguerite Barnett, the black American political scientist who has invested a great deal of effort in her study of the Dravidian movement, goes so far as to label her study, "The Politics of Cultural Nationalism in South India".[9] We believe that such an approach, mixing up schematic theory with empiricism, obscures and diverts attention from the main direction and the essential tendencies of the political development of Tamil Nadu over the past century. To start with, such an approach refuses to face the question of the awakening to national life of the Tamil people under British rule as *part of an all-India national movement.* The national question in South India, and on the Indian sub-continent, is not seen primarily as part of the national-colonial question, as an integral part of the experience of the people's struggle against British imperialist rule. The connection between the nationality formation and awakening to national life in different parts of South India *and* the evil of British colonial oppression, is obscured in a mass of secondary and often trivial detail. Rather, the anti-imperialist direction in which the national question developed is implicitly denied in such approaches which mix up irreconcilable theoretical conceptions of class, caste, nationality, political identity, and ideology.

To take up the specific viewpoint and approach of Barnett as a negative example, her story has the following elements: Elite non-Brahmins ranged against Brahmins and hence the origins of Tamil 'cultural nationalism'. Forward non-Brahmins and backward non-Brahmins and untouchables in jostling correlation and fierce contention, the fragmentation of the non-Brahmin movement, and the emergence of the demand for Dravida Nadu. Backward non-Brahmins ranged against untouchables and other backward social groups. The development of 'cultural nationalism' through all this from movement to party, along the path of pragmatic, bread-and-butter, existence.

It is as though British imperialist oppression and its insidious policy of 'divide and rule' did not dominate this historical period. It is as though the people were passive instruments, or pawns, in a drama of manipulative movements and not the active creators of the complicated history of the Indian freedom struggle.

Tamil nationalism, in Barnett's extreme formulation of this view,

> is not territorial but cultural nationalism. The cultural nationalist sees the nation as inherent in the group of people who possess certain cultural characteristics. And so, while the territorial nationalist gives priority to the direct relationship of the individual to the territorially defined nation State, the cultural nationalist gives priority to collective cultural realisation through nationalism. Cultural nationalists within a culturally heterogenous territorial State are likely to stress equality of culturally defined 'nations' or groups; the territorial nationalist, in contrast, would stress the equality of individuals.[10]

Such an approach understands the process of nationality formation and national awakening apart from their real historical and class context. By making a schematic distinction between 'cultural nationalism' and 'territorial nationalism', it reduces Tamil nationalism, by force of bookish assertion, to the former — i e, to something less than full-fledged national consciousness. Such an approach is clearly incapable of establishing any serious connection between the development of a Tamil nationality *and* developing capitalism; between the awakening to life of the Tamils as a nationality *and* the anti-imperialist and anti-feudal stirrings and struggles of the masses; between the democratic posing of the national question in terms of overthrowing imperialism and eliminating national inequality and special privilege *and* the slogan of 'national culture' employed by the indigenous bourgeoisie, partly against imperialism, partly (in alliance with the landlords) to drug the minds of the toiling people and divert them from the path of revolutionary class struggle.

The Western political scientist introduces a bookish concept into a situation where nobody is shown to have thought in these terms — or raised this slogan — in any recognisable sense. Having no reference to a living and active nationality striving, along with other emergent nationalities, to break free from the shackles of imperialism and feudalism, and unrelated to any particular class, the construct of 'cultural nationalism' relates to the Dravidian movement in the role of a pseudo-scientific mystique.

Stirrings against Social Oppression and Their Relevance

In the modern colonial society, it was no surprise at all that any movement for social equality and against caste domination had to have an anti-Brahmin orientation,[11] since the Brahmin was the supreme caste in the Hindu hierarchy, the kingpin in the oppressive *varnashramadharma* structure. In fact, there is today considerable evidence from the second half of the nineteenth century on both the extraordinary privileges of the Brahmins in Hindu society and the spontaneous stirrings of persons and groups drawn from the lower castes against this oppressive dominance.

The situation was usefully indicated, although over-simplistically, by Richard Temple who, writing in 1882, asserted that: in Bengal, Brahmin influence was moderated by the trading and literary castes, in the North-Western Provinces by the Rajputs and the Muslims; and in Bombay by the Parsis and Jains, however, in Maharashtra and South India, Brahmin influence was absolute, with the other castes in a position of almost total subservience.[12]

A variety of factors appears to have contributed to this situation in South India.[13] *In the first place* despite the decline in political power and despite the absence of any clear-cut dominance in agrarian life (except in pockets such as parts of Thanjavur district), the

FEELING...

Brahmins continued to lord it over the Hindu ritual hierarchy, treating the non-Brahmins as inferior beings. Secondly, Brahmins were in the vanguard of the developing intelligentsia, moving into key positions as officials, professors, lower bureaucrats, writers, lawyers, and editors. They were, moreover, extremely active in the leadership of the Congress and in the Home Rule movement, providing a handle to anyone interested in branding these organisations of the freedom movement as casteist and sectarian. Thirdly, there was in the Tamil districts a pointed and highly provocative movement led by Brahmin interests (especially in the first quarter of the twentieth century) in support of *varnashramadharma* — which found an influential precursor and ally in the highly divisive revivalism of the Theosophical movement pioneered by the American Colonel H S Olcott, and led with considerably more public impact by Annie Besant.

Already, in the second half of the nineteenth century, voices were raised against this hegemony and privilege. The controversy that was whipped up by British and Anglo-Indian journals over the elevation of a Brahmin, Muthuswamy Iyer, to the judgeship of the Madras High Court in the late 1870s found a responsive chord among certain sections of the people drawn from non-Brahmin castes.[14] The sentiment that "subordination to a Brahmin is an outrage that makes the blood boil in the veins of a European"[15] had been preceded by a letter (published in the *Madras Mail*) from a 'Sudra Correspondent' challenging official statements about Muthuswamy Iyer's knowledge of Hindu Law and customs and contending that the judge moved only within the rarefied cricle of his Brahmin relatives and friends and had little actual knowledge or experience of the habits and ways of the rest of the community. This correspondent went on to opine that, despite progress in Western education and other fields, Hindus were still too moved by 'caste feelings' to be expected to discharge their official responsibilities impartially.[16] Another opponent, taking on the label of a 'A Dravidian Correspondent', observed that the Brhamin was "least fitted of all castes to deal fairly with the masses ... since he considers himself as a god, and all others as Milechas". The writer proceeded to argue that, in a situation where Brahmins were holding over 70 per cent of public appointments, it would be unwise to invest them with such high positions and thereby strengthen their position in the government vis-a-vis other castes.[17]

The complex interaction among divergent movements in social reform, Hindu revivalism as spurred on powerfully by the Theosophical Society from the 1880s, interests (including missionary efforts) acting on behalf of the colonial power, and the rising forces of the national awakening has been researched in enlightening detail by Suntharalingam. What is especially interesting for our purpose is the evidence provided on the intimate liaison between Theosophy and Hindu revivalism, which created a climate for revivalism of an entirely different vintage — despite the heroic efforts by rationalist sections such as the Madras Hindu Social Reform Association[18] in the last decade of the nineteenth century.

For, intertwined with strongly democratic feelings against oppressive caste domination was a revivalist streak which went by the name of 'Dravidianism'. In fact, revivalism and obscurantism, that leaned heavily on Sanskritic *varnashramadharma* continually fed the taproots of a southern variety. This particular division contributed distinctive elements of tragedy to the correlation of the bourgeois-led freedom movement with what came to be known, over an extended period and almost interchangeably, as the 'Non-Brahmin' or 'Dravidian' movement.

Significantly, the concept of 'Non-Brahmin', inseparably tied to the idea of the unity and integrity of South India springing magically from a 'Dravidian' past, was first postulated by European colonial scholars, some of whom went so far as to postulate rigid racial divergences. Eugene Irschick pays considerable attention to the pioneering attempts of Christian missionaries to study Tamil culture and language.[19] The Reverend Robert Caldwell (1819-1891) developed the theory that Sanskrit had been brought to South India originally by Aryan Brahman colonists, and with it a peculiar type of Hinduism embodying the worship of idols.[20] He advanced the specific hypothesis that Tamil had been cultivated by 'native Tamilians' called Sudras by the Brahmins, even though they had been Dravidian chieftains, soldiers and cultivators, never really conquered by the Brahmins.[21] Caldwell (whose pseudo-scientific historical researches such as a detailed study of Shanars of Tirunelveli and a pioneering philological work have earned him a great prestige in Tamil Nadu) proposed that the term Sudra be dropped and, instead, the name of each 'Dravidian caste' be used according to the locality of the occurrence.[22] While another missionary, G U Pope (1820-1907), contributed substantially to the development of studies of Tamil literature and religion and added a new sophistication to Tamil cultural studies,[23] influential colonial officials, such as J H Nelson and the brutally repressive Governor of Madras, Mountstuart Elphinstone Grant-Duff, manipulated and made political capital out of these sentiments expertly.[24] In his 1886 address to the graduates of the University of Madras, Grant-Duff demarcated the Brahmins of South India (whom he attacked, no holds barred) from the non-Brahmins in the audience: "You are of pure Dravidian race" and "I should like to see the pre-Sanskrit element amongst you asserting itself rather more."[25]

Suntharalingam's point about the consequences of a generation of leaders of the bourgeois-led freedom movement failing to resolve tensions generated by the uneven rate of the colonial impact in South India is well taken in this context. Not that a broader approach to what a leading publicist defined in 1911 as "the intimate connection between our social and political advance"[26] was altogether absent in the earlier period. The vanguard 'enlighteners' drawn from the professional intelligentsia of the 1870s, 1880s, and 1890s, certainly represented such an approach on social issues. The controversy that developed over the Age of Consent Bill (an anti-infant marriage measure) in 1890 led to an articulate minority of 'modernisers' among the intelligentsia appealing formally for an alliance with "Dravidian social reformers and their leaders".[27] Following the rupture of ranks in the Hindu social reform movement, there surfaced in November 1892 an organisation that had as its declared objectives the promotion of education among girls and women, the reform of domestic and marriage habits and, above all, the abolition of untouchability and the "amalgamation of castes". It represented a highly progressive response to a complicated situation. The short-lived Madras Hindu Social Reform Association, whose activities invited fierce attack from the revivalists and failed to attract the support of the all-India and provincial Congress leaders, required its members to practise education of women, postponement of the marriages of daughters, inter-caste dining, and encouragement of widow remarriage, and made a polemical distinction between the 'thinking reformer' and the 'courage-of-conviction reformer'.[28]

The problem of developing a movement on the basis of "the intimate connection between our social and political advance" continued to trouble the growing ranks of the freedom movement, and especially its leadership, and through the 1890s there was expressed a strong criticism of the 'moderate' style of politics and, in fact, "disillusionment with the ideology and tactics of the Congress".[29] The disillusionment was both on political and social reform issues and the kind of response evoked in the first decade of the twentieth century — a period of radical ferment in South India — suggests a shift of the forces of the freedom movement to entirely new and higher ground.

Politically, the gains made by the 'extremist' camp within the Congress and the mass swerve in favour of this approach — as seen in the revolutionary events of 1905-1908 and, in particular, in the events of February-March 1908 in Tuticorin and Tirunelveli under the leadership of V O Chidambaram Pillai and Subramania Siva — prepared the ground for transition to an era where the freedom movement began to search actively for a wider and more powerful mass base, going far beyound the ranks of the intelligentsia.

Representing a more complex and differentiated experience for the development of social reform concerns, the new period saw, in South India, the surfacing of the 'Non-Brahmin Movement' and sharp contradictions within the nationalist ranks.

Way-out 'modernisers' such as K Srinivasa Rau, a Marathi-speaking Brahmin from Thanjavur district, put forward the view that there was no question of India developing politically until it closed its blatantly divided social ranks. "Unless the ground is cleared, the rocks and stones removed, the basis of National life broadened and deepend, and the centre of life and interests changed from persons to principles, and divergent sects, classes, and creeds to the country at large, and unless our political sympathies go forth, from the pale of Iyers, Iyengars and Raus, to wider circles of men...transcending Brahman and non-Brahman ... democracy on any large scale will be a danger, delusion and sham."[30] In a remarkable tract published in 1911 that takes the form of a conversation between an Indian and an Englishman on the political condition of India (particularly Madras), Srinivasa Rau made 'Ramdoss' define what, in his perception, were the loyalties that complicated Indian politics — among other things, "If you use the names of the particular divisions of Hindus, you touch a chord of each division".[31]

From a somewhat different stance of emphasised loyalty to the Raj, C Sankaran Nair declared in a lecture in 1909 that nationalism was "an impossible drain so long as the caste system stands in the way" and that, as a result of Brahmin dominance, other sections of society were being rendered unfit to accept political responsibility.[32]

But just as there was no question of 'transcending' either the Brahmin-non-Brahmin issue or the other social divisions of the old order without fighting it out, the facile and repeatedly publicised assumption that nationalism could not develop in South India on account of the caste divisions proved wrong It was, at best, a needless fear, at worst, an apologetic or even blatant stance in support of the colonial power.

Nevertheless, men like Sankaran Nair were making an important point when they focused on the impact on public life of the orthodoxy and ritual privileges which the Brahmins who entered the leadership of the Home Rule movement tended to saddle it with.[33] In 1913, the hearings of the Royal Commission on Public Services in Madras firmed up these feelings by highlighting the disproportionate share of posts in the Madras Government services held by Brahmins.[34]

On the eve of the First World War, feelings of resentment against Brahmin privileges in social and public life came to be widely articulated in letters to the daily press. While a writer from South Arcot district, for example, observed that "the Brahmin *vs* non-Brahmin hatred is found supreme in every Taluk",[35] another could record his bitter resentment over an experience in Madurai where he and some Brahmin friends celebrating the conferral of an honorary Rao Bahadurship on a friend came across segregation of non-Brahmins from Brahmins in the club.[36]

The academic literature on the subject tends to mix up the two issues: democratic opposition to Brahmanical privileges and participation in the freedom movement. Irschick himself seems to be either naively or calculatingly on the wrong track when he postulates that "fear of a Brahman take-over of political power, should Mrs Besant succeed in her Home Rule endeavours, set off a series of reactions which culminated in the formation of a non-Brahman party to challenge her moves".[37] It was not the 'fear of a Brahmin take-over' but a willingness to serve the British masters in what perceived to be their own class interests that led to the remarkable series of moves led by landlord and merchant interests drawn from the higher non-Brahmin castes to form the Justice party.

The whole point here is that the initially spontaneous, growingly organised, revolt of the intelligentsia and the masses belonging to socially oppressed castes against the Brahmin-dominated Hindu caste structure is not to be confused with the interests articulated in the formation of a political organisation whose organising credo was total loyalty to the British Raj, opposition to the freedom movement in all its forms, and — as the movement began to run out of steam — a single-minded hunt for patronage through implementation of communal rule. The real situation, as opposed to the illusion attempted to be created by Justice party propaganda, appeared to be indicated by the following editorial observation: "The Non-Brahmans are as solidly in favour of Home Rule as any other community, despite the efforts of a small but exceedingly vocal clique which has been magnified by the forces of reaction as representing the forty odd millions in this Presidency."[38]

Nevertheless, it would be wrong to underestimate the fact that the ideological assumption that Dravidian history was separate from, and clearly superior to, the Aryan or Brahmanic tradition in India was influentially taken over by sections of the population in South India in the first two decades of the twentieth century. It was reflected in the sporadic publishing activities of the Madras Dravidian Association (dating from 1912); in the 'Non-Brahmin Letters', a series of 21 'heart-searching' epistles authored by one 'SKN', professing to articulate the position and the aspirations of various caste groups; and, of course, in the "Non-Brahmin Manifesto".[39] For a somewhat later phase, Barnett cites the following revealing samples of not uninfluential writings from Dravidian movement journals:[40]

Dravidan (September 29, 1920): cites with approval a non-Brahmin conference resolution to the effect that "Tamil is not properly encouraged now in the present universities and that many foreign Aryans, who wielded an influence in the University, brought the language to its present low condition...".

Dravidan (October 11, 1921): categorises selfishness, trickery, mischief, partiality towards their own class, harted, and avarice, as Brahmin traits, adding

that "their selfishness is exhibited in their demanding immediate swaraj with the idea that they may hereby advance the cause of their class and making other classes their servitors, retard their own progress of the world"

Dravidan (January 22, 1923) "From the very beginning of the English rule, the cunning Brahmans in Madras have occupied all posts in the government from the lowest to the highest and have been successfully keeping out the other communities by filling up the vacancies with men of their own community"

Nyaya Dipika (January 25, 1923) "The Brahmans are also foreigners to India as are the British the Brahmans, coming into India from Central Asia three thousand years ago, put down the ancient inhabitants of the country, have created dissatisfaction among them by bringing into being racial, religious, and caste differences, and have been commanding the Indians ever since"

A Perspective on the Justice Party

In a period of accelerated, though complicated, advance of the freedom struggle among the masses in South India, both the South India Liberal Federation (or Justice party), founded in 1916 to articulate the interests of the big feudal landlords and the most collaborating section of the mercantile bourgeoisie, and the Self-Respect League, founded by E V Ramasami in 1925, made significant contact with the Brahmin-non-Brahmin issue Although disturbingly intertwined in practice, they must be analysed as independent movements influencing political development of Madras Presidency, especially the Tamil districts. Otherwise there is no question of drawing scientific conclusions from this experience.

There was certainly scope for exploiting the issue which both these tendencies took up, since Brahmins had an extremely dominant role not merely in the administrative arena but also in higher education during the period under consideration, as Irschick's research emphasises [41] "In 1921, banks and other money establishments employed Telugu and Tamil Brahmans, Komatis (Telugu Vaisyas), and Vellalas, these four groups held almost two-thirds of the available positions In public administration there was a marked preponderance of Tamil Brahmans... In po[illegible] concerned with law, instr[illegible]nd letters, the pattern was sim[illegible] The data put together by the [illegible]overnment in 1912 showed that, at the higher levels of government service where Indians were employed, Brahmins made up 55 per cent of Deputy Collectors, 83.3 per cent of Sub-Judges, and 72 6 per cent of District Munsifs [43] The analysis of caste composition among those employed in 1917 in the Revenue and Judicial departments as tahsildars, deputy tahsildars, English head clerks, sharistadars of district and sub-courts reinforces very much the same conclusion [44] In higher education itself, a break-up showed that between 1870 and 1918, the proportion of Brahmins among the students enrolled and those granted Bachelor of Arts degrees by the University of Madras was in the range 67-71 per cent [45] As for the proportion of candidates for the Bachelor of Law degree, Brahmins constituted 73 57 per cent in 1919, and for the Licentiate of Teaching degree, the figure was 73.03 per cent Only in the medical field was the proportion appreciably lower [46]

In this context, certain features of political development in the Madras Presidency during the earlier phases of the freedom movement fall into perspective As already noted, the tendency of existing academic studies to identify 'Brahmin political involvement' with the freedom movement (in its Home Rule *movement phases*) and non-Brahmin involvement with tendencies such as Dravidian 'cultural nationalism', which could not be accommodated within the freedom movement, does serious violence to the essence of a far more complicated historical reality

The most prominent example of this approach is Barnett's naively hypothesised tension between two abstract behavioural models — the 'Brahmanic' model and the 'kingly' model [47] Obviously, the dichotomisation of socio-economic 'elites' into a Brahmin/elite non-Brahmin model tension has some reference to the process of overall historical change in South India in the late nineteenth century and the early twentieth century But, since there is no attempt to research into and scientifically identify the main direction of socio-economic change, and the class reality during a period encompassing the origin, rise and development of capitalism as well as the rise and development of a new stage of the freedom movement, the schema sweeping the surface-reality misses what goes on beneath.

The crucial fact that must be grasped in this connection is that, *during the phases of modern political development with which we are concerned, the well-to-do intelligentsia played an extremely prominent role in freedom movement organisations under bourgeois, Congress hegemony*. And since Brahmins formed a disproportionately high and privileged section of this intelligentsia in the Presidency at least up to the 1920s, it has been all too easy to identify Brahmins with the politics of Home Rule and 'forward non-Brahmins' with the politics of loyalty to the Raj.

The issue becomes much clearer when we consider the role of the British Raj in sponsoring and encouraging casteism, communalism, and other divisive forces British imperialism had a deep rooted political stake in this practice which was actively adapted to the soil on which it was developed. There is no evidence whatever to suggest that it felt for the illusion, so readily accepted by later-day academic researchers like Barnett, of equating 'Brahmin political involvement' with nationalism, 'forward non-Brahmins' with 'cultural nationalism' and loyalty to the Raj, and the masses drawn from the backward and untouchable castes with a lack of involvement in either the freedom movement or cultural nationalism [48]

The revolutionary upsurge in Tuticorin and Tirunelveli in early 1908 must have been too fresh in its memory to permit any such illusion The militant masses who rallied around V O Chidambaram Pillai — drawn from the petty and aspiring bourgeoisie, the intelligentsia and, above all, the working class — could not, by any stretch of political posturing, be fitted into caste based models of understanding the freedom movement, since the bulk of them were indisputably non-Brahmin

British imperialist policy, based on powerful class interests, was a conscious policy of dividing the people of India in order to prevent them from rallying to the freedom struggle. It found and developed on this soil extensively complex elements of caste, communal discords and social obscurantism It built upon this basis, it actively seized upon and encouraged the retrograde, it promoted slogans designed to divert the masses from the struggle for Independence — such as, "Home Rule is Brahmana's Rule",[49] — it even won certain tactical successes through such methods However, the policy of 'divide and rule', even while it should not be underestimated, could not withstand the challenge of the freedom movement indefinitely. Repeatedly, the mass base and sweep of the freedom struggle made nonsense of the well-publicised assumption that, in this society, Muslim would stay divided from Hindu, forward non-Brahmin from Brahmin, backward non-Brahmin from forward non-Brahmin, untouchable from all the other castes. The growing

unity of the masses forged in struggle was undermining the very foundations of imperialist rule in India and, along with these foundations, dogmas of unalterable caste-based political behaviour which was supposed to be inherent in these 'natives'.

The failure of British imperialism and its servitors to stem the rising tide of the freedom movement was reflected in the specific political development of South India through the 1920s and 1930s: the failure of the anti-national Justice party with its slogan of 'non-Brahminism' to win the support of the masses on the one hand, and the protracted and complex development of the bourgeois-led freedom movement of the people on the other.

In 1967, speaking at a reception organised by the 'Justice Party' in Madras, C N Annadurai, DMK Chief Minister of Madras, made play with his claims to be a representative of 'three different schools of thought' — the Justice party, with its 'magnanimity' and tradition of fulfilling 'the desires of the people' and achieving 'whatever was possible without clashing with the British regime', the Self-Respect Movement, and the Congress, with its 'diplomacy in handling political problems'.[50]

This was as much to whitewash the anti-national role of the Justice party as is attempted in the far more sophisticated academic literature (notably the work of Baker and Washbrook),[51] which attempts to make it out that the quintessence of political development during the period was inter-elite and inter-group manoeuvres among the indigenous population: "The years 1916-20 in Madras City witnessed a complex series of manoeuvres between the various groups who all wished to stand forth as the leaders of the province when the benefits of the reformed constitution were released. Radical posturing and all-India alliances enabled the Nationalists... to drum the Mylaporeans out of the Congress by 1918. In early 1920, however, just as they were preparing to use the Congress name and organisation to fight the first elections to the new legislatures, they in turn lost control of the provincial Congress to their erstwhile allies from the mofussil.... The Nationalists had to quit the Congress or they had to stay in it and ignore the elections; either way it was, for them, a step into the political wilderness.... The battle for the leadership of the province under the dyarchy constitution was thus left to the Mylaporeans and the Justicites."[52]

The Justice party itself, in this view, was "...a very mixed bag indeed. It included City merchants and politicians .... Then there were professional men.... Several families which spread widely in the public services... were also interested in this new group.... Next came several of the biggest estate-holders of the province, particularly the rajas of Pithapuram, Ramnad, Bobbili and Kalahasti.... Finally there was a scattering of local politicians of all sorts.... The banner around which these various groups clustered was the cause of the non-Brahman community."[53]

The 'cause of the non-Brahman community' referred to here is chiefly the demand that seats be reserved for 'non-Brahmans' in the new Legislative Council. In this academic view, "as a tactical weapon... it was superb. Behind the demand for the reservation of seats was a request that government should recognise the Justicites as the leaders of the non-Brahman majority in the province, and should admit that the non-Brahmans deserved special considerations. In this way, the Justice leaders would become the main channels of government patronage.... By 1920, they had won a good measure of success."[54]

Let us see what kind of 'success' was won by the Justice party, how, and with what consequences for politics in the Presidency. We can study this in the light of the detailed empirical research done on the subject, notably by Irschick. The class interests involved in the founding of this party cannot be in serious dispute, although it is true that the support it drew was somewhat 'mixed'. The conclave of 30 or so non-Brahmin leaders, including T M Nair and P Tyagaraja Chetti, at the Victoria Public Hall in Madras in November 1916, might have decided only to form a joint stock company, the South Indian People's Association, in order to publish newspapers in English, Telugu and Tamil and articulate 'non-Brahman grievances'. However, by December that year, the issuing of the 'Non-Brahmin Manifesto' and the formation of the South India Liberal Federation made explicit the ideological and political line of the new movement. The tone was decidedly anti-national and the immediate agenda was frontal opposition to Home Rule agitation. Beginning on the note that

> the time has come when an attempt should be made to define the attitude of the several important non-Brahmin Indian communities in the Presidency toward what is called 'the Indian Home Rule Movement'.

the Manifesto declared that non-Brahmins could never support any measure that

> in operation, is designed, or tends completely, to undermine the influence and authority of the British Rulers, who alone in the present circumstances of India are able to hold the scales even between creed and class and to develop that sense of unity and national solidarity without which India will continue to be a congeries of mutually exclusive and warring groups within a common purpose and a common patriotism.[55]

The newspapers of this so-called Non-Brahmin movement — *Justice*, released on February 26, 1917, *Dravidan* (in Tamil), begun in mid-1917, and *Andhra Prakasika* (in Telugu), founded in 1885 and taken over — actively pushed the view that Home Rule would benefit only the Brahmins.

The real interests behind this movement and these slogans were also evident from the fact that, right from the beginning, the bulk of funds supporting the newspapers and activities of the Justice party came from the big landed gentry of the Presidency. Irschick reveals that, within a year of its founding, the party was formally backed by at least Rs 100,000.[56] Backed by such muscle, the organisation attempted to spread throughout the Presidency.

Exploiting the weaknesses of the Congress-League scheme, and the disillusionment it created among influential sections of the freedom ranks, the Justice party attempted to advance its political line of servile loyalty to the Raj under the signboard of the 'Non-Brahmin Movement'. One interesting counter-move, in 1917, was the formation of the Madras Presidency Association (MPA), whose immediate platform was to forward a scheme to ensure full communal representation to non-Brahmins — but without in any way breaking ranks with the freedom movement.

Forced to counter the Justicite propaganda that it was a tool of the Brahmins to undermine the rising status of the Non-Brahmin movement, the MPA went on to build an influential organisational structure. Irschick makes an important point relating to the difference in class character between the Justice party and the MPA, in noting that only a relatively few zamindars and large landowners backed the latter, which was, in fact, in constant trouble over funds.[57] The MPA responded to the Justicite claim to represent the real interests of non-Brahmins by quickly reversing its initial opposition to communal representation and putting forward the line — worked out by its President, P Kesava Pillai in co-operation with influential activists of the freedom ranks such as E V Ramasami, T V Kaliyanasundaram

Mudaliar, P Varadarajulu Naidu and V Chakkarai Chettiar — at the special Madras Provincial Congress Conference in December 1917 that, given the peculiar circumstances of the Madras Presidency, "the communities... other than Brahmanas should also be adequately represented in the Legislative Council".[58]

Finding a good part of their thunder stolen by an organisation from within the freedom ranks, and smarting under the refusal in the Montagu-Chelmsford 'Report' to concede the principle of communal representation, the Justice leaders concentrated on demonstrating with increased blatancy their loyalty to the Raj. The enactment of the hated Rowlatt Act and the Jalianwala Bagh massacre of April 13, 1919, gave them an opportunity to court British favours more actively. Commenting on the Rowlatt 'Report', Tyagaraja Chetti, one of the Justice bosses, exclaimed: "To what community belong most of the persons who find a bad eminence in that Report? Who is the central figure among them? He is none other than the Brahmin gentleman (Tilak) who has been elected to the Presidential chair of the next session of the Indian National Congress."[59] The party also condoned the massacre at Amritsar commanded by General Dyer. This, according to Irschick, reveals "more clearly than any other instance the degree to which it was cut off from all-India opinion and events."[60]

The proceedings of the Joint Select Committee in London to concretise the final details of the Government of India Bill (by way of implementing the Montagu-Chelmsford proposals) attracted a strong Justicite attempt to have communal representation accepted for the Madras Presidency. The contingent which arrived in England, apart from the top leader, Nair, included all the chief satraps of the Justice bloc, including the representative of the All-India Landholders' Association and Madras Zamindars and Landholders' Association, who was later to become the Raja of Panagal and the chief party boss.[61] Following Nair's death due to illness in England (before he could tender evidence before the Joint Select Committee), K V Reddi Naidu and A Ramaswami Mudaliar took up the task on behalf of their party. Appearing before the Committee on August 12, 1919, Reddi Naidu prefaced his remarks with the observation that substantial numbers of non-Brahmins had joined the armed forces, that 'Besantine agitation' was bogus, and that Brahmins were unfit to undertake several administrative responsibilities.[62] Asserting that India could not be considered a nation, he tried to demonstrate an irreconcilable racial divide between Brahmins (Aryans) and non-Brahmins (Dravidians). The way out of the inequitous situation, he explained, was to give non-Brahmin caste Hindus a system of communal electorates. In answer to a specific question, he explained that the Justice demands included in the term 'Non-Brahmin' all those who were neither Brahmin nor untouchable.[63]

Appreciating the content and spirit behind the Justice party proposals, the Committee showed a new receptivity, on behalf of the colonial power, towards the argument that a special approach was needed in a presidency where conditions were evidently exceptional. Or, as Ramaswami Mudaliar put it in a memorandum to the Committee, the Madras Presidency should be "treated as the 'political Ulster of India.'"[64] Following this remarkable performance, the Justice leaders made intensive efforts to court the favour of the British Press, undertook speaking tours in major centres of that country, and tried to form a liaison with sections of the Liberal and Labour parties. When the Joint Select Committee included in its 'Report' of November 17, 1919, the recommendation that the non-Brahmins of Madras Presidency "must be provided with separate representation by means of reservation of seats",[65] it appeared that the Justice party had driven home its point (at least to its colonial patrons) although the way the recommendation was implemented fell far short of its expectations.[66]

With the 1919 constitutional scheme in action, the politics of grovelling before the Raj found fresh scope. A creature of the British, isolated from everything national, democratic, and enlightened (and under Tyagaraja Chetti's narrow-grained leadership divesting itself of whatever social reform pretensions that existed), the Justice party rode to office in the 1920 elections. Irschick makes clear the character and significance of these elections: Only 2.9 per cent of the total population of the Presidency was eligible to vote and the voter turn-out was barely 25 per cent of this. With the Congress boycotting the polls, the Justice party was left unchallenged in the field and bagged 63 out of the 98 elected seats. Boosted by government appointments, the strength it could boast of was actually 81 in a Legislative Council of 127.[67]

The bunch that took office at the invitation of Lord Willingdon — initially with A Subbarayulu Reddiar, a landlord from Cuddalore, as 'chief minister' and later led by P Ramarayaningar, the future Raja of Panagal — carried absolutely no conviction among the masses. Its reactionary political orientation was remarkable for opposing everything that was popular and anti-colonial and for the total isolation this policy earned for the party in national affairs; while the abuse of authority, the sordid hunt for patronage and the corruption became a sensitive election issue in 1926.[68]

It viciously attacked Gandhi, in his capacity as the rising leader of the freedom movement, and his programme of non-co-operation with the Raj. Characterising him early in 1921 as "the least tolerant and most vain of public men", who sought to trade on his standing among the illiterate masses, to spread false doctrines, it came out frontally against the Malabar uprising of 1921, going so far as to attack Gandhi (intriguingly, in the light of his known hostility to this anti-imperialist and anti-feudal uprising) as preparing to "convert this country into a cremation ground before it attains Swaraj".[69]

Gandhi's decision to call off non-co-operation following Chauri Chaura in February 1922, and growing evidence that the masses rallying to the freedom struggle could not be contained within the limits imposed by the bourgeois leadership of the Congress, only invited the official Justicite response that it was doubtful that the Bardoli decisions would be honoured by the great number of "hooligans and rowdies" who had flocked to non-co-operation to "indulge in their nefarious predilections towards violence and lawlessness".[70]

There is now iron-clad evidence that the Justice party demonstrated in office, among other things, that it had no sympathy whatsoever for the untouchable masses who were struggling for elementary democratic rights. Developing out of the militant strike of workers at the Buckingham and Carnatic Mills in 1921, the management's effort to prise untouchable workers away from their caste Hindu colleagues began to yield poisonous fruit. Leading to clashes between the untouchable sections (against whom segregation was practised even within the factory) which were persuaded to go in and the 'caste Hindu' strikers, the tactic provided the government the pretext to resort to a murderous volley of firing which took several lives.[71]

With Justice party journals drawing

from the experience, the wretched conclusion that there was "undue pampering of the Adi-Dravidas by the officials of the Labour Department, and partly by the, perhaps, unconscious encouragement given to them by a few police officers",[72] the situation appeared tailor-made for a diversion from the class issues involved. The British, past-masters at using such an opportunity to split the ranks of the toiling people, went all out to picturise the class struggle of vanguard of the working class in the Presidency and the weaknesses and gaps that had been exposed in the field as essentially a caste problem.[73]

The 'Puliyanthope troubles', as these happenings came to be known, revealed the extent to which the Justice party in office was alienated from the masses of the untouchables and even their welfare organisations. Leaders from the untouchable ranks, such as M C Raja, a member of the Legislative Council, began sharply to criticise the Justice party as out of tune with the aspirations of their people. At the second South India Adi-Dravida Congress held at Koilpatti in Tirunelveli district in mid-1923 — after this organisation had broken ranks with the Justice party — he observed that the party's 'natural animosity' towards the untouchables had been evident long before the 'Puliyanthope troubles'.[74]

Irschick sums up the results of the first stint in office by the Justice party usefully. First, even on social questions,

> the party's unwillingness to allow the untouchables to play a role in its policy indicates the closing of party ranks to include only caste Hindus with a relatively high position in the ritual hierarchy, an established position in government service and education, and a strong investment in the land and commerce of south India . Second, not only had the social role of the Justice party become narrower and more conservative, but election to the Council and the formation of a Justice ministry had changed the party ... into a mere political mechanism, a broker for government jobs for a few select non-Brahman caste Hindus.[75]

He might have added, a political mechanism at the beck and call of the colonial power and a broker for patronage which alienated itself growingly from the people — for one thing, in the 1923 Council elections, when the electorate had risen to 3 per cent of the total population and the voting turnout to 36.2 per cent of this, the Justice party lost ground from 1920. It won only 44 seats as against 63 earlier and it was only the government appointment of 17 additional members that gave it a leg-up to carry on in office.[76]

In the period of its rapid decline that approached senility, the party went through the motions of building bridges to the non-Brahmin movement in Maharashtra — with little avail.[77]

That the efforts to put on a new face at this stage had no serious effect was reflected in the trouncing that the Justicites received in the 1926 elections at the hands of the Swarajists and even independents; and Irschick's evidence shows that the party was very close to demise in 1926.[78] With substantial sections of the former activists and sympathisers leaving the party to join the ranks of the freedom movement — which was developing in a new phase of mobilising the masses, with new tactics — a Special Confederation of the Justice party convened at Coimbatore in July 1927 attempted to make a virtue out of necessity by recognising that it was "permissible for such non-Brahmans as desire to do so to join the Congress maintaining intact the individuality of the Justice party".[79]

With the death of the Raja of Panagal in December 1927, a phase in the political development of the Presidency came decisively to an end. "It was really the end of the party, though for eight more years it led a twilight existence and even held office, between 1930 and 1936...".[80]

Such, then, was the character and experience of the party that British colonial interests went all out to promote as an alternative to the organisations of the freedom movement in Madras Presidency. The historical data are far too firm today to allow any illusions about its 'magnanimity' and 'success'.

Rise of Self-Respect Movement

Meanwhile, a series of highly significant socio-political and ideological developments facilitated the emergence of the *suyamariyathai iyakkam* — associated with, but independent of, the path of development of the decrepit Justice party. The year of E V Ramasami's formal break with the Congress — coming after repeated attempts to have it out on social issues — signals no less than a new phase in the political development of Tamil Nadu. While the Justice party tried to spread its tentacles throughout the Presidency (and while its class character leaves little room for dispute), the Dravidian social reform movement started by E V Ramasami in 1925 (with the able assistance of S Ramanathan) and concentrated within the Tamil districts of the Presidency, was powerfully oriented towards oppressed groups in the caste hierarchy, including untouchables, also adopted concrete measures to involve women and youth.[81]

Although, unfortunately, EVR took to employing Justice party platforms to preach his views on self-respect and social equality it must not be forgotten that he also used these occasions to sharply criticise that party's attitude to social reform.[82] The social and class character of the *suyamariyathai iyakkam*, which was clearly different from that of the Justice party, must be considered an open-ended question that only detailed research with a scientific basis can solve.

However, the information now available on the political activities of E V Ramasami (1879-1973), the founder of the Self-Respect movement, reveals a great deal of the history of the Dravidian movement. As a boy from a well-to-do merchant family boldly violating caste-based rules of social behaviour; as a young man who sought and failed to find the personal and social answers he was looking for in sanyasihood and religious mysticism; as an ardent Congressman who campaigned wholeheartedly for freedom and social reform and spent a small personal fortune as part of his commitment to the movements; as a Congressman alienated by the high-caste prejudices and social obscurantism of the party leadership in the Presidency and in the country, notably Gandhi; as an enemy of Congress upholding the banner of militant social reform which claimed it sought to "turn the present social system topsy-turvy and establish a living bond of union among all people irrespective of caste or creed",[83] as a social reformer who, following a visit to the Soviet Union in 1931, campaigned with short-lived conviction in support of socialism and participated in conferences against landlordism and usury; as a leader of the Self-Respect League falling, tragically, into the trap of collaboration with the Justice party; as the leader of a Justice party completely discredited among the people; as the founder-leader of the Dravida Kazhagam collaborating with British imperialism against the freedom movement; as a tragic figure railing against the transfer of power, characterising Independence Day as a 'day of mourning' and demanding 'freedom from Brahmin Raj', as a supporter of the newly formed Dravida Munnetra Kazhagam led by former lieutenants who had broken loose from his authoritarian hold over the organisation, and an enemy of the Congress Ministry

headed by C Rajagopalachari; as a supporter of the 'Kamaraj Congress', seen as representing the interests of 'real Tamilians'; as a supporter of the DMK in power; as an idol-breaker who, towards the end of his very long life, polemicised against and rejected the Tamil language and Tamil culture set up as fetishes; as a militant propagandist of social reform divorced from, and contraposed to, class analysis and a scientific theory of economic and political change — the rich, many-sided, outrageously inconsistent life of this Periyar ('Great Elder') of Tamil Nadu politics seems to embody many of the specific historical features and contradictions of political development in over three quarters of a century.

The biographical details now available on Periyar provide insights into the weaknesses, the inconsistencies, the vacillations and the contradictions of the bourgeois leadership of the freedom movement. The failure to win over and keep this outstanding individual and his followers within the camp of the freedom movement is a measure of the failure of this leadership to provide consistently democratic answers to the key issues of the day. This particular inconsistency, which could be sharply discerned in the split between the 'extremists' and the 'moderates' of the 1905-1908 period, was expressed in a more developed and refined form in Gandhism: its essence lay in what R P Dutt characterised as "the disastrous combination of political radicalism and social reaction in India".[84]

Two Trends within the Self-Respect Movement

It is important to grasp the fact that, in its social determinedness and content, the Self-Respect movement which appropriated the slogan of 'Non-Brahminism' covered two essentially different tendencies. These tendencies diverged sharply in terms of philosophical-social outlook, although politically they made common cause with the Justice party. It is certainly no small qualitative distinction that is involved between the 'moderate' and 'radical' positions that academic researchers have tended uncritically to identify within the social reform movement. The qualitative distinction is between a revivalist-idealist position that claimed to return to the spiritual, religious and social roots of an idealised Dravidian path and a crudely atheistic, metaphysically materialist attack on religious and social obscurantism led by Periyar.

The first trend, artfully espoused by the leadership of the Justice party, faded away with the decline and demise of that party. The second trend, whose popularisation was essentially a phenomenon of the late 1920s, was carried forward actively and militantly by Periyar and far outlived the Justice party, influencing political development in Tamil Nadu after Independence. In an atmosphere charged with suffocating remnants of superstition and religious obscurantism, of caste division and privilege, this revolt against Brahmanical Hinduism and *varnashramadharma* — characterised by a simple and straightforward sharpness and gaining, over the years, in qualities of popularisation — had an important positive role.

If the movement can be said to have diverted people's consciousness, energy and organisation from class issues, the essential explanation is that the theoretical and practical work of those charged with the historic responsibility of taking up class issues, and of developing the class struggle towards successful democratic and socialist revolution, was too weak to prevent the people from being so diverted. Some of the more perceptive leaders of the working class movement and party critically grasped the positive elements in Periyar's contribution even while evaluating his pro-British political positions and his opportunist role following the transfer of power. Some others were carried away to the extent of considering him a great revolutionary fighter. When the working class party and movement as a whole comes to a serious historical self-criticism and evaluation of its work, it is likely to explain the connection between its line and practice *and* the specific ideological-political alternative to Congress dominance and Congress rule that emerged and developed in Tamil Nadu.

The tendency of certain academic researchers, such as Barnett, to identify the essential differences between Periyar and the working class movement as a difference centering on alleged 'Brahmin domination' of the Communist party[85] reflects an absurdly superficial and false understanding which *refuses to go beyond Periyar's words* and see the profound differences in class outlook, ideology and practice that separated him from the working class movement. These approaches completely miss the significance of the role of the working class in the freedom movement between 1918 and 1947 and the qualitative change brought about when the political line and practice of the working class began to contend — given all its limitations in development — with the political line and practice of the bourgeoisie. They are unable to see the political and practical differences between the bourgeoisie and the proletarian approaches to a series of issues, including the content of freedom and the problem of democratic social reform

In Tamil Nadu, in the twentieth century, there became increasingly evident two irreconcilable cultures, the culture of the bourgeoisie and the landlords and the culture of the cruelly, often barbarically, oppressed and exploited toiling people. The latter contained, in however rudimentary a form, live democratic and socialist cultural elements. The development of the industrial working class was the leading factor in the development of the democratic and socialist culture; the process of differentiation among the peasantry, throwing growing numbers into the ranks of the rural poor and intensifying the class contradictions in the countryside, strengthened the objective basis for the development of this culture.

If the bourgeoisie and the landlords — initially drawn by and large from the top sections of the upper castes — appropriated the slogan of 'Tamil culture' and 'Dravidianness' and used it to *mobilise the masses behind them*, it must also be recognised that the democratic and rudimentary socialist elements in Tamil culture and society repeatedly asserted themselves in political life. This became increasingly evident as the oppressed classes provided the developing basis for the freedom movement, as they increasingly fought against social and cultural degradation as well as class exploitation and to overthrow the colonial oppressor.

The strivings, the struggles, the revolts of the people belonging to the lower and untouchable castes in Tamil society to improve their social position form an important component of the democratic struggle.

Historical studies of the complex interaction in Tamil Nadu between caste and class under the modern colonial impact have merely begun. The major part of data available relate to the changes over a century and a half in the socio-economic position of the masses drawn from the Nadar caste, formerly a depressed caste known as Shanars. The pioneering study is by the American political scientist, Robert L Hardgrave, Jr,[86] a detailed probing which lights up the field brilliantly in spite of being somewhat naive in its sweep and in certain theoretical assumptions about the forces of socio-economic and political transformation.

Hardgrave's empirical data concern the masses belonging to a caste which includes very large numbers of those who "lived almost wholly from the products of the palmyra, and the vast majority... engaged in climbing"; and sizeable sections who were already in the beginning of the nineteenth century active in regional trade.[87]

With the development of transport and communication and new opportunities for expanding trade, the Nadars fanned out north of the Tambaraparni River into 'Maravar country' with jaggery, dried fish, and salt. Immigation followed trade and this significant movement resulted in the creation of *pettais*, fortified enclosures protecting their trading interests, and new mercantile settlements. The Nadars appear to have settled in the early part of the nineteenth century, according to the evidence provided in Hardgrave's narrative, in six primary centres — Sivakasi, Virudhunagar, Tirumangalam, Sattankudi, Palayampatti and Aruppukottai — known as the 'Six Towns of Ramnad'. In these concentrations there developed a stratum of enterprising merchants, middlemen and moneylenders who accumulated substantial wealth. The bulk of the masses belonging to this caste grouping (which had a number of sub-branches) continued to labour in extremely humble occupations and were subject to harsh socio-economic oppression, nevertheless, the formation of new and rising classes closely tied to the impact of British rule brought about significant changes both socially and politically in the region.

Almost without comprehending the theoretical significance of his rich empirical data, Hardgrave is dealing with the formation of a modern class, drawn from a very depressed social section ritually considered just above the untouchables, of petty bourgeois and bourgeois sections involved in mercantile and moneylending activity. This is the preparatory phase for the origins of the bourgeoisie in the late nineteenth century and in the first quarter of the twentieth century. A most interesting part of the study is the consequential impact of this objective transformation, in terms of the stirrings of large masses drawn from this particular caste against social oppression. The formation of loose mercantile associations in the settlements, of caste councils to administer communal funds and administer corporate authority in other respects, of exclusive temples and schools. These are sketched by Hardgrave as part of the process of modern socio-economic articulation.

Hardgrave's narrative identifies an initial process of imitating the Brahmanical customs of the higher castes among the more developed mercantile and moneylending sections of the community — as a response to "the incongruity between the economic position of the Six Town Nadars and their low social status".[88] He also traces in detail the conflicts that arose with the masses drawn from the higher castes (especially the Maravars, the numerically dominant caste of the region) beginning in 1860 at Aruppukottai and Palayampatti. In 1872, a case was brought by the dominant Brahmin and Vellala interests of Tiruchendur against seven Nadars for entering the temple; in 1874, some Nadars of Madurai unsuccessfully sued in the court of the Second Class Magistrate of the town on the claim that criminal force had been used by the servants of the Meenakshi temple in expelling one Mooka Nadan from the temple; a similar case, brought two years later at Tiruthangal in Ramanathapuram, was also unsuccessful.

The situation culminated in a series of bloody and fratricidal clashes, with the superintendent of police in Tirunelveli recording an 'unstable equilibrium', which he gloated over thus: "Everywhere the lower castes are asserting themselves, while denying the caste below the right which they themselves newly claim."[89] With zamindars and powerful landlords drawn from the higher castes taking a strong hand in all this, according to Hardgrave's evidence,[90] the situation developed towards a major conflagration — which, starting from raids by a confederacy drawn from a wide variety of castes (who considered themselves antagonistic to the Nadars) on Nadar villages in the vicinity of Sivakasi, culminated in the murderous sacking of Sivakasi on June 6, 1899.[91] The large masses of Maravars who formed the leading force in the attack were sent in retreat, but not before a substantial loss in lives, dwellings, and property, had been inflicted. The fighting once again moved to the rural areas and when the military was finally brought in, nearly 150 villages had been involved and a few thousand houses destroyed.[92]

The response to all this was to strengthen the urge to form caste associations believed to be for socio-economic uplift. Whereas the Kshatriya Mahajana Sangam, formed by several prominent merchants and traders congregating in Madurai in 1895, never really got going,[93] 15 years later a plenary session of the caste association in Poraiyur in Thanjavur district convened and hosted by an educated and extremely wealthy family of *akbari* contractors resulted in a Tamil Nadu-wide caste association of Nadars, the Nadar Mahajana Sangam. The association became extremely active between 1917 and 1921, promoting an upsurge of attempts to speed up educational activity (including education for girls) and Nadar welfare and philanthropic activity.[94] From then on, the momentum of socio-economic and political transformation gained speed and scale, with a strong push made for securing educational opportunities and government patronage. In addition to schools and colleges, the Sangam was instrumental in founding libraries, reading rooms, and even a co-operative bank.[95]

New antagonisms took shape and surfaced sporadically between the sharp and powerful Nadar traders, middlemen and moneylenders and other sections of the people — which these powerful interests attempted to meet by increasingly taking up the banner of all-in Nadar unity and communal uplift.[96]

In 1922, the first efforts to establish mechanised production of matches by two Nadar traders (with imported German machinery) began to yield results in Sivakasi, but production quickly switched to hand processes in response to economic factors caused by the high cost of mechanised production and the abundant availability of super-cheap labour.[97] From matches, the route of productive activity that the aspiring Nadar bourgeoisie took was fireworks production and litho printing, introduced in 1930.[98] Yet, the main character of Nadar bourgeois activity remained trade, with very little movement into industrial spheres other than those mentioned above.[99]

And what is most significant for our purpose, a differentiated process of response to the developing political situation manifested itself. Whereas, earlier, the leaders of the Nadar caste organisation declared themselves as eternally loyal to the British Raj — with a resolution of absolute feisance being a set feature of Nadar conferences from 1910 on — and whereas even with an upswing in the freedom movement influential persons such as WPA Soundarapandian continued to articulate their political positions *via* the non-Brahmin movement and the Justice party in favour of the colonial Raj,[100] the myth of Nadar political behaviour as a caste bloc began to dissolve with the onset of the first non-co-operation movement. As Hardgrave sees it,

Today, in retrospect on the 1920s

JAWAHARLAL NEHRU UNIVERSITY

Advt. No. Aca. III/1/79

The School of Computer & Systems Sciences and the School of Life Sciences of University have openings for faculty positions in the following areas:

I. **School of Computer & Systems Sciences:**

1. Professors/Senior Fellows — two
   (i) Decision and Optimization Theory
   (ii) Computer Systems (Software)

Knowledge of computer based simulation/modelling information system would be relevant.

2. Assistant Professor — one
with specialisation in Computer Applications to Numerical Methods, Numerical Software and Applications.

II. **School of Life Sciences:**

3. Professor/Senior Fellow — one
   in Plant Physiology

Essential Qualifications:

For Posts No. 1 & 3 (a) Consistently good academic record with at least a high second class Master's Degree in the appropriate discipline or an equivalent qualification from an Indian/Foreign University.

(b) A Doctor's degree or published work of an equally high standard.

(c) About ten years experience of teaching and/or research, in interdisciplinary area.

For Post No. 2 (a) Consistently good academic record with at least a high second class Master's Degree in the appropriate discipline or an equivalent qualification from an Indian/Foreign University.

(b) A Doctor's degree or published work of an equally high standard.

Provided that if the Selection Committee is of the view that the research work of a candidate as evident either from his thesis or his published work is of a very high standard it may relax any of the qualifications prescribed in (a) above.

Provided further that if a candidate possessing a Doctor's degree or equivalent research work is not available or is not considered suitable, a person possessing a consistently good academic record (weightage being given to M. Phil or equivalent degree or research work of quality) may be appointed provided he has done research work for at least two years or has practical experience in a research laboratory/organisation on the condition that he will have to obtain a Doctor's degree or give evidence of research work of equivalent high standard within five years of his appointment, failing which he will not be able to earn future increments until he fulfils these requirements.

Desirable

For Posts No. 1 & 3 Capacity to guide research

For Post No. 2 Some teaching experience, post doctoral research experience

Scales of pay:

Professor/Senior Fellow	= Rs. 1500-60-1800-100-2000-125/2 2500
Assistant Professor	= Rs. 700-40-1100-50-1600

Relaxation in any of the qualifications may be made (a) in favour of persons of eminence or of high academic professional distinction, and (b) in exceptional cases where adequately qualified persons are not available but are otherwise found suitable for the respective positions. It will also be open to the University to consider the names of suitable candidates who may not have applied.

The selected candidates will be expected to participate in the teaching and research programmes in the concerned disciplines in other Schools of the University as well as in the programmes offered in their own Schools.

Normally appointment of Senior Fellows is made on contract basis for a period ranging from one to three years.

Benefits of C. P. Fund-cum-Gratuity/G. P. Fund-cum-Pension-cum-Gratuity are available as per University rules.

Persons already in employment should route their applications through proper channel.

Due consideration will be given to candidates belonging to SC/ST at the level of Assistant Professor.

Second class (mail) rail fare (both ways) will be paid to candidates invited to appear for interview from outstation by the shortest route subject to the production of rail receipt.

Applications, separate for each post, on the prescribed form, obtainable free of cost from the University by sending a self-addressed and stamped envelope of 23 cm × 10 cm size to the Deputy Registrar (Academic) Jawaharlal Nehru University, New Mehrauli Road, New Delhi 110 067 should reach him latest by **17 March, 1979** (superscribing on the envelope the post for which form asked for).

Candidates from abroad, applying for faculty positions, may apply on plain paper, (but their applications should reach the University by the last date) furnishing all the relevant information such as their names, date and place of birth; marital status, nationality, state of domicile, postal and permanent addresses, father's name and address, academic and professional attainments, full details of (a) publications, and (b) research projects undertaken; language(s) known; details of visits to foreign countries, and the names and addresses of at least two persons well acquainted with the candidates professional work who should also be requested by the candidate to forward to the DEPUTY REGISTRAR (ACADEMIC) Confidential Report concerning the candidate.

Ddav 847(31)/78

> and early 1920s, many Tamilians will speak of the solid support of the Nadar community for the government. In fact, however, a major portion of the Nadar community opposed the Justice party and gave its wholehearted support to the Congress and the non-co-operation movement. It was not E V Ramasami Naicker but Gandhi who captured the imagination ... The Nadar Mahajana Sangam ... remained essentially an organisation of the merchant community of Ramnad and Madurai. The Sangam's support for the Justice party reflected the solid support of the Six Town Nadars for the non-Brahmin party ... The situation in Tinnevelly, however, was fundamentally different ... [here]. The Nadars presented a common Congress face to the Justice Vellalas .... During the 1930s, fissures began to appear in the solidity of the Ramnad Nadars for the Justice party . The Sivakasi Nadars were unwilling to remain followers of a Virudhunagar clique, and as the Justice party began to take on the colour of atheism in the Self-Respect movement, the more conservative Sivakasi Nadars reacted with profound distaste .... In Virudhunagar, the Justice leadership did not go unchallenged, but opposition was silenced by the overwhelming power of the Justice party group, in both wealth and numbers. The western portion of Virudhunagar, 'the wrong side of the tracks' at that time, was the section in which many of the poorer Nadars lived, together with Muslims and other castes Coolie labourers and small shopkeepers, they were a backward community in comparison with their educationally advanced and wealthy neighbours east of the tank ... There was a strong but rarely voiced sympathy for the Congress.[101]

K Kamaraj Nadar, later to become an important leader of the Congress movement on a national scale, was brought up on Virudhunagar's 'west side'. Beginning with defiant activity in the non-co-operation movement, braving the disfavour of the caste assembly for his participation in the 1920 Vaikom satyagraha against the exclusion of untouchables from the temples, Kamaraj's long and tangled political career began to express the strength as well as the glaring inconsistencies and weaknesses of the Congress leadership of the freedom movement and in relation to social reform. Nevertheless, the story of Kamaraj and his times represents a sharp turn in the political situation among the broad masses of the Tamil people, which reduces to absurdity assumptions of watertight caste-based political behaviour.

In contrast to Kamaraj as an activist of the freedom movement drawn from the smaller trading interests of the Nadar caste grouping, stands the public life of W P A Soundrapandian, an acknowledged leader of the caste-based association who entered the camp of the Justice party and yet retained his active involvement in social reform. Apart from championing what came to be known as a programme of social uplift for Nadars, he made attempts to improve relations between the caste organisation he led and other backward and depressed communities. As a matter of fact, under his leadership, attempts were made to have schools and temples which were exclusively run for Nadars thrown open to untouchables. Soundrapandian actively entered the Self-Respect movement under inspiration from E V Ramasami, militantly employing his position and influence to take up such causes as the abandonment of the Sanskritic pretensions of an earlier generation, the affirmation of Dravidian Self-Respect within his caste, remarriage of widows, a ban on the use of Brahmin priests for Nadar weddings, and Self-Respect marriages.

The combination of activism in the freedom movement and a declining and ineffective concern with a mild brand of social reform on one side, the combination of support for the anti-national Justice party and vigorous involvement in the Self-Respect movement on the other — this sharp variance between two leading representatives drawn from the Nadar caste ranks expresses an essential feature of the overall political development in Tamil Nadu in that epoch.

The historical data on the Nadars have been cited in detail to emphasise the kind of complicated objective processes which provided a backdrop to the organised political activity of the period as well as to Dravidian social reform efforts. *To the extent that it drew attention to the social, ritual and cultural oppression of the masses of the people of the non-Brahmin and lower castes and made contact with real socio-economic processes, the radical trend represented by E V Ramasami within the Dravidian social reform movement identified itself with the assertion of democratic cultural elements in Tamil society.* It expressed a radical challenge to the social and cultural foundations of this order.

Although non-Brahminism has been the organising centre and most catchy signboard of the movement that Periyar led over half a century, the content of the movement was by no means restricted to that. His attack on Brahmanical pretensions developed on a wide front against the caste system, superstition, ritual hierarchy, *Manusmriti*, mythology, temple worship, Hinduism and religion itself. The idea was popularised that Brahmanical Hinduism was the invention of a small clique in its selfish interests and needed the soil of ignorance, illiteracy, and exploitation of the masses to flourish. This was done with directness and imaginative polemical force. Ingersollian rationalism was picked up and made use of repeatedly over the years of development of the Self-Respect movement, but Periyar's own rationalism had a more vigorous atheist orientation and a stronger populist flavour, expressed in the celebrated Periyar saying: "God does not at all exist. The inventor of God is a fool. The propagator of God is a scoundrel. The worshipper of God is a barbarian."[102]

With the kind of historical data available today, it is clear that his *suyamariyathai iyakkam* doctrine, after his break with the Congress, went far beyond the bounds of philosophical rationalism, embracing such wide democratic social concerns as: an attack on orthodox Hindu assumptions of 'superiority' and 'inferiority'; the right of access to temples and wells of all communities and the rooting out of untouchability, the fierce caricaturing of Brahmanical mythologies; the diversion of temple funds for non-religious purposes, the conduct of marriages on the principle of Self-Respect (i e, rational and equal consent between the man and the woman) without the use of Brahmin priests and rituals, quite frequently with Periyar himself officiating; the abolition of all caste suffixes in names; the uplift of women and a rational approach to numerous other social evils in South India.[103] In particular, the attempts to force the entry of depressed castes into temples and the public ridicule of Hindu texts preaching an oppressive Brahmanical code[104] differentiated Self-Respect social concerns from the varieties professed by the Justice party.

At the annual Self-Respect conference at Erode in May 1930, the movement, not only inscribed equal civil rights for depressed castes and for women on its banner, but went so far as to advocate measures to redistribute wealth within society.[105]

Baker's research suggests a firm correlation between the radical Dravidian social reform movement and a complex of socio-economic changes taking place, by drawing attention to the fact that Periyar's movement struck "deeper root in some of the towns that were being deeply disturbed by economic change".[106] Its headquarters were

in Erode, Periyar's home town, and its sweep extended to the two rising manufacturing centres, Madurai and Coimbatore, as well as Salem, Tiruchirapalli, the port of Tuticorin, the towns of the Chettinad area in Ramnad, some of the growing trading towns of the cotton tract such as Virudhunagar and the new industrial suburb of Madras city, Perambur.[107] Baker makes another valuable point when he remarks that the compromising "dependence on the patronage of certain leading Justicite politicians ensured that the movement's radicalism remained mostly rhetorical".[108]

As it turned out, the contradictions that appeared in the socio-economic and political spheres proved too much for Periyar's Dravidian programme to tackle in a consistently democratic way. The prominence assumed by caste associations among sections which contributed a substantial and rising mercantile class — such as the Devangas of Salem and Coimbatore, the Nadars, the Komatis of the Andhra districts, the Beri Chettiars of Madras — as well as among castes which comprised wide sections of the peasantry as well as landlord interests, such as the Gounders, constituted a new social and political phenomenon of the 1930s. The spontaneous and embryonically organised anti-zamindar feelings and activity,[109] in the Tamil and the Andhra areas demanded a response that could link the militant social agitations of the type led by Periyar with a firm democratic attack on feudal landed relations and its attendant values.

While there was no question of the intelligentsia or the bourgeois leadership of the Congress providing any such programme, the actual historical development emphasised that neither could it be provided by the camp of Periyar — for reasons that remain to be investigated in detail. In a word, the Self-Respect movement could not sustain its social radicalism consistently, much less extend it democratically to the sphere of politics in order to develop a combined anti-colonial and anti-feudal movement.

Context of National and Democratic Advance

The larger context in which the Self-Respect movement worked out its course through the 1930s and 1940s was, of course, the growing mobilisation of very broad masses — above all the working class and the toiling peasant masses — under the banner of overthrowing the colonial oppressor. As early as in 1931, Periyar "found that many of his lieutenants were attracted by the idea of agitation and political martyrdom, and some abandoned him to join the Civil Disobedience campaign or small underground revolutionary associations".[110]

So far as Periyar was concerned, he was clearly no successor to Jyotiba Phule of Maharashtra — "the great iconoclast democrat, the friend of the poor and oppressed" who spearheaded "a liberation challenge to the entire Hindu society and to the colonial structure" and "never wavered in his loyalty to the masses, in giving priority to their interests".[111] Nor was he cast in the mould of Javalkar who, in the 1930s, refused to turn back to non-Brahmanism but went ahead to combine the anti-caste struggle with a championing of the peasant and anti-imperialist struggle — talking of a peasant war against capitalism, of an independent peasant organisation, of the Russian revolution, and of a non-violent peasant army.[112]

The closest Periyar came to linking his militant social reform concerns with an attack on feudal and semi-feudal agrarian relations and advocacy of political power in the hands of the democratic masses was in the immediate aftermath of his return from Europe and the Soviet Union in the early 1930s, when he temporarily espoused the revolutionary cause, participated in anti-moneylender and anti-zamindar activities, and, as Baker puts it (although somewhat patronisingly), "preached revolution throughout Tamilnad, erected a 'Stalin Hall' to house a Self-Respect conference in Coimbatore, and gave the Self-Respect movement the litany that 'capitalism, superstition, caste distinctions and untouchability must be rooted out'."[113]

Such activity was not sustained in the face of intimidation and repression by the colonial regime. "In 1934", as Baker portrays the weakening and surrender, "government started to bring him to heel. They jailed him for a seditious article which, among other things, accused the Justice ministers of *'sharing the spoils' of government*, arrested him again for conniving in the publication of a revolutionary pamphlet, and, when they started in early 1935 to mop up all ... (communist and leftist organisations in the province) forced him to a recantation of his bolshevik views."[114]

And, tragically, in a period when the freedom movement began to make a big impact on the peasantry and other sections of the people, when certain radical and fighting elements who had once functioned within the confines of the 'Non-Brahmin movement' overcame their separation from the anti-imperialist current, and when communists arising out of the anti-imperialist struggle were able to attract or combine with other democratic currents — notably in the Kerala and Andhra areas, but also in pockets of Tamil Nadu — Periyar moved into more and more opportunist collaboration with those whose organising credo was servility before the colonial oppressor.

Following the trouncing which the remnants of the Justice party received at the hands of the Congress in the Madras Legislative Assembly elections of 1937 — with all the bosses, including the Raja of Bobbili, P T Rajan (a big feudal landlord of Madurai district), the Kumararaja of Venkatagiri, and A P Patro, defeated — Periyar took formal charge of that party in a desperate attempt to find his political moorings. The lesson that he drew from the rout, and from the mass defection of Justicites into the Congress camp or into inactivity, was typical:

> Now, many people change from party to party.... Since the recent foolish election has shown that all those who want jobs and posts should join the Congress, now the people who want positions and those who will not have any respect if they do not have these positions and those who have no other goal in life are fast joining the Congress .... It is my opinion that we should feel happy about this ... (because) the Justice party is being purified.[115]

In 1937-38, the working class of India was conducting several extensive strikes for better conditions and for national and social emancipation.[116] A prominent feature of the labour movement during this period was solidarity strike-action and joint worker-peasant demonstrations which succeeded in forging the fighting unity of the working people, irrespective of religion, caste, or nationality. The organised trade union movement made rapid strides in the Madras Presidency, particularly in the Coimbatore industrial centre.[117] The All India Trade Union Congress (AITUC) increased its strength among the organised working class, made inroads into the strength of other organisations, and became the rallying centre of the whole labour movement. A distinctive feature of the working class action during this period was the clearly political character of the demands raised by vanguard sections.

The period 1937-39 was marked also by the increased strength of the organised peasant movement reflected in an increase in the membership of the All India Kisan Sabha (AIKS), although unevenly in South India.[118] The ad-

ance, which came in the wake of a series of partial struggles against feudal landlordism and imperialist oppression, was particularly striking in the Malabar region of the Madras Presidency.[119] Following the formation of the Congress Ministry headed by C Rajagopalachari in July 1937, the rural poor, under the leadership of the All Malabar Karshaka Sangham, launched mass struggles against landlordism and for agrarian reform. The actions of the peasantry, which sharply exposed the class character of the Congress party and in particular its inability to carry out election promises, played an important role in bringing about the final split within the Congress organisation between the 'Left' and the 'Right' and in the emergence of an influential Communist party in the Kerala region, with leaders of the calibre of P Krishna Pillai, A K Gopalan and E M S Namboodiripad. The active mobilisation of agricultural labourers and poor peasants — the bulk of whom belonged to the lower and untouchable caste — was a feature of mass organisation in only a part of the Presidency and, speaking in general, did not occur in the Tamil-speaking areas during this period. Yet, it represented a rising trend that certainly had an impact on the class configuration and the political development of South India as a whole, including the *Dravidar Iyakkam*.

The struggle of nationalities, in demanding an end to the hated system of colonial Provinces and the formation of states based on the nationality principle, was particularly advanced in South India during this period. The development of mass political activity that followed the formation of the provincial governments, with all their class limitations, stimulated the national movements of Andhra, Kerala and Karnataka and, in an entirely different way, the national movement in Tamil Nadu. The Congress leadership paid lip-service to the right of nationalities to form independent states, but tended in practice to oppose mass movements in support of this democratic demand. It must be remembered too that students became an organised force in the Presidency in the fight for Independence, democracy and socialism precisely during this period.

It is true that the outbreak of the Second World War affected the growth and development of the fighting movements of the toiling and democratic masses and, in particular, the activity and membership of the Kisan Sabha.[120] Nevertheless, the war could not stop or reverse the activity of the mass and democratic organisations. The protest movement against India's forced involvement in the imperialist war developed on a broad scale, and a spontaneous demonstration by workers in Madras city on the first day of the war was a striking feature of this protest.[121] Unrest among the peasantry demanding lower rents and a moratorium on debts manifested itself chiefly in the Andhra and Kerala regions. The glorious struggle of the Kayyoor peasants[122] which broke out in March 1941 sharply expressed the contradiction between the rural masses on the one side and imperialism and landlordism ranged on the other. The struggle of the nationalities — trapped within the Madras Presidency and also within the princely states — for the formation of autonomous states based on the linguistic and nationality principle assumed particularly acute forms among the major non-Tamil nationalities in South India

The objective change in the character of the war into a people's war and the lifting of the ban on the Communist Party encouraged the development of the kisan and trade union movements extensively. The All India Kisan Sabha steadily increased its membership during the last three years of the war.[123] In South India, especially in the Andhra and Kerala areas, the Kisan Sabha led the struggle of the tenants and agricultural labourers against oppression by landlords and moneylenders and against hunger and eviction. It was during this period that the Kisan Sabha and the Communist movement began to take root among the untouchable agricultural labourers of East Thanjavur [124]

With the end of the war and the rout of the fascist aggressors, the class contradictions within the country sharpened tremendously. The transfer of power came in a situation of unprecedented mass revolutionary upsurge. This upsurge was characterised by peasant revolts, the greatest of which developed in Telangana, general strikes of workers, student strikes, the mass struggles of the peoples of the 'native states' and, above all, the direct involvement of the armed forces in the anti-imperialist movement. Madras Presidency became an active scene of this mass revolutionary activity of 1946. Militant demonstrations by workers, students, and the petty bourgeois masses, in solidarity with the Royal Indian Navy (RIN) struggle in Bombay, took place in Madras city, Madurai, Tiruchi and some other parts of the presidency.[125] Apart from these the strike struggle of the South Indian Railway workers in August-September, and the general strike of the Coimbatore textile workers in November of that year, the struggles of the agricultural labourers and poor peasants in Kerala, culminating in the armed uprising of workers and peasants in Punnapra-Vayalar, the militant upsurge among untouchable agricultural labourers in eastern Thanjavur and, above all, the Telangana people's armed struggle — this anti-imperialist and revolutionary upsurge of the toiling and democratic masses profoundly affected the character of the political arena in the Presidency, ushered in independence, and provided the context in which the Dravidian movement had to work out its line and programme of action.

This experience has to be researched in detail in order to draw sober lessons about the course of development in South India, but it is an absurd caricature indeed that reduces the mass mobilisation of the late 1930s and 1940s in Tamil Nadu to the mobilisation of backward castes for patronage — "for a greater share of government appointments, power and influence."[126] In fact, the tendency of Western academic researchers to speak of the behaviour of the 'backward castes' in socio-psychological and manipulative terms obscures the very essence of the political development of the period: the intensification and expansion to new territory of class contradictions and the increasing political initiative and involvement of the toiling and democratic masses drawn from various castes The edge of this initiative and involvement though the late 1930s and the 1940s was directed against imperialism. This is not at all to deny specific weaknesses in the organisation and consciousness of the people in South India or in India as a whole, or to deny the fact that particular sections belonging to the lower and untouchable castes were driven by an oppressive social order and influenced by opportunist leaders to fall victim to the imperialist policy of 'divide and rule'. Such weaknesses and setbacks in the anti-imperialist, democratic and revolutionary movement must, however, be examined in a scientific historical perspective.

It was remarkable that, through all this, Periyar was able to plough his isolated furrow of the 'Non-Brahmin movement' with the slogan of Tamil Nad for the Tamilians', cut off from the broader all-India currents. The anti-communism of this movement was becoming more pronounced during this phase When war broke out in 1939, the coalition of the rump of the Justice party and the Self-Respecters unasha-

edly supported the war policy of the colonial government and, leaning upon the Muslim League demand for Pakistan, emphasised its own demand for a separate Dravida Nadu[127] — loyal to the British Empire and to be directly administered by the Secretary of State for India.

The ill-advised decision by the Rajagopalachari ministry to introduce Hindi as a compulsory language in schools and then, when the first anti-Hindi agitation was organised by the Dravidian movement, to use the notorious Criminal Law Amendment Act against the demonstrators[128] gave Periyar and his followers an opportunity to pick up a sensitive cultural issue and employ some of the methods of agitation developed within the freedom movement against a Congress Ministry.[129] The occasion also witnessed, as has already been noted, the first explicit demand issued for a separate Dravida Nadu for Dravidians.

Periyar's political perspective in this phase became clear from other kinds of issues he was championing: for example, as late as in 1940, he was petitioning the Governor of Madras with the complaint that the communal rule had not been observed properly.[130]

Such a line could not but have a serious impact on those (including a part of the leadership) who had been mobilised under the banner of the 'Dravidar Iyakkam" — even as the line pursued by the Justice party in its heyday during the 1920s, had its own impact, bringing about a significant defection to the Congress During this period of ugly collaboration with all that was pro-imperialist and anti-democratic, Annadurai (who had become an important leader next only to Periyar) expressed his political differentiation with the policies of the boss. Grasping the need for a less compromising political policy and for fresh efforts to revive the movement among the masses, he proposed, at the Salem conference of the Justice party in 1944, four resolutions which indicated the response of a significant section within the Dravidian movement to the mood of the times

(1) Those who had been granted honorary titles by the British should immediately surrender them, and nobody should receive such titles in future.

(2) Those who held honorary positions such as Honorary Presidency Magistrate, leader of the local panchayat and so on should resign these posts.

(3) The habit of attaching suffixes denoting caste to names should be given up, now and for the future.

(4) The name of the South India Liberal Federation or Justice party should be changed to Dravida Kazhagam immediately.

In fact, in a certain sense, the formation of the Dravida Kazhagam itself in 1944 out of the decrepit Justice party was a concession to the mood of the times. Another round of mass efflux of Justicites to the Congress in the wake of 1937 pointed to a clear trend. To win over the masses in a radically changed situation, the DK adopted a new political signboard and new slogans. It made a desperate attempt at a political recovery among the masses by offering them a programme that attempted to subsume their class and national oppression to their ritual and social oppression by Brahmins and 'Aryans' as an explanation of their unacceptable condition.

The nature and demand of the times intensified the differences within the Dravida Kazhagam, resulting in the surfacing of two conflicting political lines One line, represented by Periyar, set itself in frontal opposition to the movement for Indian Independence and demanded freedom from 'Brahmin Raj'. The other trend, represented by Annadurai, came out for accommodation with the freedom struggle even while continuing to focus on the demand for freedom from 'Aryan' Congress yoke. Periyar's rigid world-view and the organisational methods he pursued, contributed to the development of these differences. In 1947, Annadurai took the party close to a split by publicly disclaiming identification with Periyar's notorious declaration that Independence Day was a 'day of mourning' by noting in contortionist fashion:

> We, the Dravidians, have been emphasising that we should not be under British rule ever since 1939. Even at *a time when the country was in ferment* with anti-Hindi agitation, in the Madras conference we demanded complete freedom and autonomy for us For years it has been our endeavour and cherished wish to be free from the foreign yoke. But today, after abolishing alien rule, the Congress is trying to impose Aryan domination. We oppose the Congress solely on this ground.[132]

Despite conciliatory moves and very temporary truces, the two trends moved irrevocably towards a split in newly independent India. Following the public controversy with Periyar over the Independence issue, Annadurai and his supporters actually withdrew themselves from active involvement in party affairs, boycotting even the conference organised for a separate Dravida Nadu in October 1947.[133] Between this time and October 1948, a final effort to bring about a compromise yielded some results, with Annadurai proclaimed as Periyar's successor at the Erode conference of the party.[134]

However, following 70-year-old Periyar's decision to marry a 29-year-old woman and anoint her his 'successor' — which was made out to be in outrageous contravention of the principles of Self-Respect — Annadurai and his followers abandoned the DK and formed a new political party. The final split in 1949, which brought a whole stage in the development of the *Dravidar Iyakkam to a close, had been brought about* by a combination of factors. Among these were differences over political positions, over tactics, over the issue of participation in elections, over organisational questions (specifically inner-party democracy), and over political morality and style.

The essence of the split, in short, was a significantly divergent response within the *Dravidar Iyakkam* to the new challenges of political development in independent India.

Impact of Compromising Line of Bourgeois Leadership of Freedom Struggle

While placing the various streams emerging from the 'Non-Brahmin movement' — and especially the Self-Respect stream — in the historical perspective of the mobilisation, in phases, of the whole people against the colonial oppressor, it is vital to draw the proper conclusions about the character of the leadership of the freedom struggle.

We have already noted how, in the earlier phases of the freedom awakening in South India, the intelligentsia which played such a prominent role in giving the movement its shape failed to provide consistently democratic responses to the social, economic, and political issues involved While the Western-educated sections of the intelligentsia who came under the influence of the bourgeois *enlightenment* compromised on a whole range of issues connected with the people's quest for liberation, the more militant sections which asserted themselves in the 1890s and the first decade of the twentieth century and identified themselves with the aims and interests of the rising bourgeoisie attacked British colonial rule compromised by making common cause with the old feudal order and its institutions. This section explained all this as directing fire against the

enemy
crucial [illegible]
against [illegible]
and the [illegible] old order (including caste and oppressive hierarchical social structure), proved a serious obstacle to unifying the masses on an anti-imperialist and democratic programme.

And it was not as though the compromising characteristics of the intelligentsia and the aspiring bourgeoisie were confined to the Brahmin and higher caste sections. The nascent sections of the intelligentsia springing from the lower castes were strongly asserting democratic aspirations by challenging their own inferior social position, but the grave limitation was that, time and again, they failed to go beyond their own narrow worlds of caste and community and link themselves to broader democratic currents. In Tamil Nadu, at any rate it is clear that during this transitional period the radical and advanced sections who found a new path were more than matched numerically and in terms of political significance by those who drifted into opportunism or were diverted from the central goals. B T Ranadive puts the matter in clear perspective in relation to the experience of the Non-Brahmin movement in Maharashtra:

> The compromising and uncompromising trends in a democratic revolution always clash fiercely, as they did here. The participants had their own subjective consciousness of fighting a struggle between Brahmans and non-Brahmans. But deep historical forces were at work and the tendency to compromise with feudalism clashed with the uncompromising trend which manifested itself as a wholesale opposition to the caste system and demanded all-round liberation.[136]

If Periyar spearheaded the uncompromising trend of overthrowing the old hierarchical social order for a time, it was inevitable that, given the class limitations, his movement would be fairly quickly swamped by opportunism. The camp commanded by Periyar did not, of course, remain stagnant or unaffected. While certain elements broke away to merge with the most advanced democratic and revolutionary currents (as has been noted), by far the preponderant section became part of another type of political development. Ranadive portrays this lucidly, again in relation to Maharashtra:

> With the passage of time and the growing grip of opportunism, the earlier form of anti-Brahman opposition becomes its real content.... *The new intelligentsia, nurtured among the non-Brahmans, the product of Western education, gives exact weight acts as a bourgeois intelligentsia gives up the pioneer's uncompromising principles, merges* [illegible] from the most [illegible] communities sooner or late accepts the framework of bourgeois democracy, satisfies itself with a general declaration of rights, leaving the masses in the lurch. (emphasis in original)[136]

If these weaknesses and gaps could be seen clearly in the phases of the development of the freedom movement until the early 1920s, they became much more pronounced after that — despite the fact that Gandhi and the new bourgeois leadership of the Congress marked a significant change from the old orthodox leadership.

The compromising character of the Congress leadership in the Madras Presidency could be seen in the confusion and vacillation over Council boycott and a series of tactical questions affecting the freedom struggle. It lay in the failure to adopt a meaningful programme of agrarian reform. The weakness was also sharply exposed in the approach to sensitive social demands. It is significant that a resolution moved at a meeting of the Madras Provincial Congress Committee in June 1920 by V O Chidambaram Pillai (renowned for his swadeshi activities earlier in the century), to the effect that the Congress should champion the demand for securing proportional representation for non-Brahmins in the public services and representative bodies in the presidency, was adopted most hesitantly and after being watered down substantially.[138] The inability to face the problem frontally or place the issue in democratic perspective became more and more emphasised during the next half decade. It took the form of rebuffing repeated attempts by non-Brahmin sections within the Congress to have the issue of proportional representation for their castes clinched; bypassing a move at a party committee meeting in April 1922 to set up a committee to investigate and recommend ways to bring about a better understanding and relationship between Brahmins and non-Brahmins; and developing a quarrel in November 1922 at a Congress meeting in Tiruppur (near Coimbatore) over a resolution to allow Nadars entry into the temples.[139]

C Rajagopalachari, a prominent 'no-changer' and a close colleague of E V Ramasami's during this phase, appeared to embody all the conservative and compromising traits of the bourgeois Congress leadership and came under grave suspicion specifically for clinging on to Brahmanical social hierarchical institutions and values and for his trend of appointments to party posts.[140] The gap between the forces represented [illegible] Ramasami within the freedom movement widened rapidly through the 1920s. The latter's militant activities in the Vaikam protest against untouchability[141] — which earned for him the title of *Vaikam Veera* (Hero of Vaikam) from his admirers — had been far ahead, in terms of significance as well as tactics, of the line worked out, in person, by Gandhi. And the difference was only too glaring on the issue of separate dining at a traditional school in Kallidaikuruchi in Tirunelveli district run on behalf of the Congress by VVS Iyer, a former revolutionary terrorist. The fact that as late as in January 1925 the Congress leadership of the Presidency was vacillating and temporising on the issue of non-Brahmins being forced to eat apart from Brahmins, could not but be expected to embitter matters.[142] The final break came in the Kancheepuram conference of the Tamil Nad Congress Committee in November 1925, after two resolutions moved by E V Ramasami recommending that the Congress should recognise the principle of communal representation for non-Brahmins in public services and representative bodies were disallowed by the chairman.[143]

The conservative positions of Rajagopalachari and his close associates on the question of Hindu social hierarchy, *varnashramadharma*, and quite explicitly caste, and their frequently expressed conviction that Vedantic Hinduism was a guarantee of social discipline, have been emphasised in Copley's research into Rajagopalachari's political career.[144] The backward-looking attitude was expressed, decades later (in 1953), in the move to promote education according to traditional vocational background. This drew a barrage of justified accusations that it was based on Brahmanical and high-caste prejudices against the masses of the lower castes and it triggered off an inner-party revolt to replace Rajagopalachari as Chief Minister.[145]

Even more significantly, there is firm evidence today that E V Ramasami's highly subjective alienation from the freedom movement on account of differences with the top Congress leadership was provoked and fanned by a series of public positions adopted by Gandhi (especially during his visits to Madras) on social questions. For example, Irschick cites the instances of Gandhi telling a gathering in April 1921 that "in Madras I have not a shadow of doubt that Hinduism owes its all to the great traditions that the Brahmins have left for Hinduism..., the Brahmins

have [illegible]
ought [illegible]
purity of [illegible] life,[146] reiterating in March 1925 that "if you but follow Varnashrama Dharma in its spirit, we shall cease to be puny individuals and we shall walk in the fear of God",[147] and clarifying (in the wake of criticism of his positions in the Tamil districts) in 1927 that, being a non-Brahmin himself, all that he wanted to emphasise was that "Varnashrama Dharma is not an unmitigated evil but.. one of the foundations on which Hinduism is built (and) defines man's mission on earth".[148]

By no means confined to words and actually converging with the highly provocative *varnashramadhrama* movement being conducted in Tamil Nadu, the conservative stance adopted by the provincial and national leadership of the Congress on sensitive social issues bears a heavy responsibility, indeed for the separation of Self-Respect activists from the freedom ranks.

The lesson, therefore, is clear beyond dispute in the light of historical data available on modern political development in South India The compromising bourgeois leadership dared not champion the agrarian revolution and attack the basis of the old order and its institutions and values. It failed consistently to advocate democratic solutions to unite the masses and to work out tactics to promote their unfettered struggle to overthrow both the colonial structure and the old social order. It could not unite all the democratic currents in society. Only the working class, guided by Marxism-Leninism, could do that And, while the working class movement linked itself more and more assertively in the advanced phases of the freedom struggle, with various other democratic currents — including left tendencies in the Congress as well as from the ranks of the non-Brahmin movement, the State people's progressive aspirations, anti-caste agitations, and the peasant movements — its advance has, to this day, not been rapid enough or on such a scale as to wrest the political initiative in the land of the Tamils from the organisations of the Dravidian movement.

Notes

1 The hypothesis of the Dravidian movement as a political effect of the transformation of 'primordial sentiment' was put forward by Robert L Hardgrave, Jr, in "The Dravidian Movement", Popular Prakashan, Bombay, 1965; and various others have followed it up. The thesis of 'cultural nationalism' is basic to Eugene F Irschick's "Politics and Social Conflict in South India: The Non-[illegible] nalism, [illegible] University Press, [illegible], 1969, and has been [illegible] developed by Marguerite Ross Barnett in her detailed study, "The Politics of Cultural Nationalism in South India", Princeton University Press, Princenton, New Jersey, USA, 1976. For a detailed (and somewhat polemical) critique of Barnett's work, see N Ram, 'Prehistory and History of the DMK', pp 59-91 in *Social Scientist,* December 1977, No 65.

11 B T Ranadive makes this point in his review article 'Towards an Understanding of the Non-Brahman Movement', a critique of Gail Omvedt's study, "Cultural Revolution in Colonial Society — The Non-Brahman Movement in Western India, 1873-1930", Scientific Socialist Education Trust, Bombay, 1976, in *Social Scientist,* March 1978, No 68, p 78.

12 R Temple, "Men and Events of My Time", London, 1882, cited by Suntharalingam p 7.

13 These are dealt with, unevenly and with differring emphases, in Suntharalingam, Irschick, Barnett, [illegible] brook, South India: Political Institutions and Political Change 1880-1940", Macmillan (India) Delhi, 1974. Washbrook's attack on naive, mega-caste-based models and interpretations of South Indian society quickly demolishes the abstract theoretical foundation on which academics like Barnett build their case. Mega-lables like 'Non-Brahmin', or even 'Vanniya Kula Kshatriya', did not represent the essence of social reality, although they were certainly derived from a complex social reality. These lables were adopted for specific purposes which can be understood in the context of larger economic, social and political conditions. Washbrook and Baker criticise some of the superficialities and untested assumption inflicted on existing academic studies of South Indian society and political development, but their own standpoint is basically pro-imperialist and directed towards covering up the connection between the complex political development of a historical epoch and the principal contradiction — between British imperialism and the masses of the people of India.

[illegible] pmen[illegible] njavur

Kisan Movement

Interplay of Class and Caste Factors

Saraswathi Menon

Thanjavur district has been the area of the most advanced peasant movement in Tamil Nadu. In its struggle the peasantry faced a historically developed landlord class, powerful not merely by its land monopoly but further strengthened by caste — a structure of social relations which was closely adapted to the class structure and yet retained its own dimensions of oppression.

The manner in which the Thanjavur peasants and bonded labourers were historically bound by these structures and the experience of their struggle against them is significant for the development of the democratic movement in India.

FROM the days of their first contact with Thanjavur, British observers wrote of the prevailing monopoly in land exercised by a very small section of the population. A member of this privileged class would own thousands of acres of the most fertile land in the Cauvery delta area, often spanning several taluks.[1] In 1800, it was noted that a single landlord could decide the behaviour of the grain market in a single taluk.[2] Landlordism in Thanjavur has its roots in the past, in a form of landownership known traditionally as the *mirasi* system. The principle of communal ownership must have been strongly expressed during its early evolution.[3] Lands may have been cultivated in common, individual shares being apportioned when the produce was divided, after the State share was accounted for, and the village servants had received their annual 'keep' on behalf of the entire mirasdar community. Over time, waste and reclaimed lands alone appear to have been held in common, while arable land was either permanently distributed or redistributed after a fixed interval of years. As recently as in 1921, it was observed that there were villages in which land was periodically redistributed.[4] Even as late as in 1865, private sales of land by shares were recorded, "but these are quite exceptional areas and it may be said generally that the system of redistributing fields and with it most traces of the old communal ownership of village lands is dead throughout the district."[5]

This form of landownership was attended by an important social characteristic. Throughout India, landownership has usually been restricted to a few upper castes — in Thanjavur the mirasi system was linked to the sway of Brahmin landlordism. This provided for a peculiar influence of ideology over production relations, the caste system intervening in the division of labour and the organisation of production, and in this manner sharpening and rigidifying class oppression.

Under the feudal Cholas, groups of Brahmins were granted villages for their livelihood.[6] In time, this practice gave rise to the restriction of landownership to the Brahmin caste in such *brahmadeya* villages, to the exclusion of other castes. The ritual ban on Brahmins tilling the land, springing from the historical disdain of a privileged section of society for manual labour, encouraged the growth of multi-caste villages, where the Brahmins held land and the other castes were placed in a social and economic hierarchy of self-sustaining rights and services. The rigidity of this system sustained the Brahmins' ideological dominance over the lives of the people. Their caste assembly was unquestionably the decision-making body in the village. But in some villages, other upper castes also held land and in such cases early records note that two village assemblies would function — the Sabha (of Brahmins) and the Ur (of the other castes). The former decisively exerted more influence.[7]

In 1807, the Tanjore Committee had noted that "there is hardly a family of this colony which does not hold land on ordinary mirasi tenure in Tanjore".[8] Seventy years later, Brahmins, who formed little over six per cent of the district's total population, held over 25 per cent of the ryot pattas. Landownership by other castes, however, was not negligible. Many such landlord castes, such as the Moopanar, Vellalar, and Naidu, have held land granted to them by Maratha rulers. But, despite these trends, the overall dominance of the Brahmins is distinctive. Unlike the situation in other areas, "Brahminical Hinduism is here a living reality, and not the neglected cult shouldered out by the worship of aboriginal godlings... almost every village has a temple."[9]

Extensive landownership by more powerful temples, particularly in east Thanjavur, further strengthened the bond between ideological and economic dominance. Under the Cholas, temple land was subject both to State supervision as well as control by the village assembly, headed by the Brahmins. The difficulty of directly managing extensive temple lands was resolved by leasing first to Brahmins and then, since this caste was barred ritually from cultivating, subletting to other castes.[10] Temple landownership has thus served as one of the principal sources of subletting in Thanjavur. It further influenced the condition of the peasantry by its 'right' to vary rents widely.[11]

The early colonialists recognised the strength of communal ownership in land, and the first revenue settlements were made on the village as a whole and shares were allotted by village elders to individual mirasdars. The initial settlements aimed at establishing a close relationship with the traditional landlords. While the system retained certain aspects of the old revenue system, new features were incorporated. A fixed money rent was gradually sought to be introduced. Relations within the village community between the landlords and the working people had traditionally been in grain transactions. Only purchases of luxury commodities by the wealthy from towns had been made in cash. But the colonialists enforced a gradual monetisation of the rural economy.

The high assessments of the early Collectors deepened the misery of the cultivating peasantry and landless labour, who were squeezed of their meagre

share by the landlords. Under their "oppressive mode of taxation",[12] only the wealthiest mirasdars could meet the revenue assessment The ryotwari system of assessment was intended to ameliorate this condition, so that colonial revenue could be ensured In practice, however, the earlier rates of assessment were used as the basis for the new settlement, and an ever-increasing thirst for plunder, combined with the steady fall in prices of agricultural commodities, did little to improve the condition of the peasantry In a general survey of conditions in 1853-54, the distress of the peasantry in all districts of the Presidency was noted with the exception of Thanjavur However, as an early Collector had noted, here, "One inhabitant has all the enjoyments to be procured from a fertile country, while another cultivating the same soil obtains little more than he would were he the cultivator of a desert"[13]

The ryotwari system decisively undermined the dying village community Both the settlement and the assessment ran contrary to the traditional practices of the village community The former was now made on an individual basis, and the latter was fixed on land as against the produce Certain rights of the mirasdars were withdrawn — such as their right to waste land and extra emoluments for the upkeep of temples Landlordism itself was retained, however, in a different form In theory, ryot pattas were granted to cultivating landowners — the British arguing that private property had been developing within the earlier mirasi structure of land rights as reflected in cases of individual mirasdars owning a village However, the British had noted the growth of absentee landlordism even before the imposition of the ryotwari system, and the new settlement merely sanctified such holdings It is notable that, although the British spoke of protecting the interests of the cultivator, no laws relating to tenant protection were passed during the nineteenth century

During the first half of the nineteenth century, the mirasdars leased out their land to tenants (*pykaries*), who formed two categories — *porakudis* or tenants-at-will, with leases of an year, often immigrants from other villages and with no right of occupancy; and *ulkudis* who were more firmly based in the village community. Possibly residents of the village over generations, their right to continue the lease was hereditary. The British considered them quasi-proprietary, but also described them as semi-serfs[14] Their bond to the landlord was stronger and customary labour services were demanded of them.

Under the ryotwari system, indebtedness and alienation of the land of these small holders were intensified The breakdown of the customs of the village community was typified in the removal of the ban on outsiders cultivating village land As a result, the old-world distinctions between the different classes of tenants were erased and the ulkudis were reduced to tenants-at-will, losing their traditional security of tenure

The demolition of the village community had an important result — the growth of usurious power over the peasantry In the traditional system, land could not stand surety for a debt, and a debt was bound by customary practices Under colonial rule, a new comprehensive right was granted to the ryot to sell, gift and mortgage the whole or any part of his land The moneylender played an important role in the village He would intervene by buying the peasant's produce at special prices, wrenched by advancing seeds and implements on loan earlier, mediating in the extraction of rack-revenue As a market in land developed, the moneylender extended his grip to the land itself, and contributed in no little way to the growing tendency of alienating the peasant's land The conditions of the cultivators of small plots of land, whether they owned the land they cultivated or suffered further under different forms of tenancy, were miserable and steadily worsening As the relative security of the village community was shattered by colonial penetration, the excessive revenue demand swallowed their meagre surplus Traditionally, the large landlords had monopolised the market, as the cash nexus and market relations developed further during the nineteenth century, new market opportunities were annexed by the larger landlords The deepening crisis of the colonial economy was expressed in the drive of the peasantry off the land — to no alternative outlet in the warped pattern of development

On the larger mirasdars' estates, three methods of cultivation prevailed — *varam* or sharecropping, *kuthagai* or fixed rent, and the *pannayal* system. Varam was more widespread than kuthagai at the beginning of the nineteenth century. The share of produce granted to the tenant varied extensively between taluks. In many cases it was affected by the availability but at the beginning of this century it was said to average 20 per cent of the gross crop[15] The share often depended on the relative strength of the peasantry and the landlords and the more powerful landlords in the delta area of east Thanjavur wrested a larger share from the peasantry. A 1921 revenue settlement survey remarked on the persistence of the same customary share to the tenant, despite his worsening condition. "In only two villages out of nearly 200 did I find any recent change In one of these cases the porakudis had combined in a strike last year and successfully increased their share[16] Cultivation expenses were traditionally shouldered by the tenant, whose family also provided the principal labour on the land Advances taken from the landlord would form the core of a permanent debt which would only further deepen the tenant's dependence on the landlord

It is probable that a form of bondage containing historical elements of slavery developed over time, to contribute to the establishment of the pannayal system Instances of slavery have been noted during the Chola period, although it is clear that its practice was not on an extensive scale[17] But for a significant period of time mirasdars in Thanjavur have extracted labour on the basis of extra-economic pressure The pannayals are described thoughout the nineteenth century as living under extremely harsh condition, although they had won certain rights[18] Their main work was agricultural but there were no limits on the type and length of work extracted from them. The earlier village community headed by the mirasdars was traditionally obliged to provide labour to maintain local irrigation works and the pannayal's labour was deployed on such occasions Similarly, each mirasdar customarily had to provide labour to pull temple cars at festivals Pannayals would be despatched, a number of times during the year, often to a distant taluk Interestingly, for some time the British under the guise of respecting native customs not only condoned this odious practice but provided guards as escorts for the forced marches[19]

By the first half of the twentieth century, changes in the pannayal system — owing to colonial intervention — were clearly discernible. Cash wages

were gradually being introduced, but wages still varied markedly from one estate to another, and the variations contributed to keeping the pannayals submissive and separate. A new structure of debt slavery developed which intensified the vulnerability of the labourer. A labourer would by this system bind himself, his wife and unborn children to labour for a landlord from whom he might have borrowed Rs 25 or Rs 50 to get married.[20] The pannayal was entiled, in addition to a daily wage, to a tiny house-site and plot for backyard cultivation, but these perquisites could be withdrawn at the landlord's slightest whim and were used to maintain an extra-economic hold over the pannayal.

In the articulation of this system, the caste system has played a most pernicious historical role. The ideological constructs and the structure of social relations which the caste system imposes upon the people bear traces of features of a more ancient social formation. Concepts of consanguinity and commensality, seemingly totemic caste names and socially prescribed marriage alliances evoke tribal society. Yet, over time, the caste system — in response to more fundamental changes in society — adapted and even transformed itself Inextricably bound up with agrarian relations, it provided for the persistence of highly retrogressive features in the village community. Through its rigid divisions among the people, the caste system contained seeds of extra-economic oppression and, in fact, gave it a distinctive character

By rigidly separating a section of the people as 'untouchable', the caste system facilitated the creation of a tied labour force for the landlord class. The ritual ban on untouchables renting land further deepened the separation between the labouring caste and the land that they worked. The untouchables had to live in a hamlet distinctly set apart from the main village. Over and above their harsh conditions of work, they were branded with the mark of ritual pollution at birth. And, in addition to creating a labour force bound hand and foot, its function was further to emasculate them from struggle by attempting to make them fatalistic, servile, and a prey to ferocious exploitation and vicious punishment — "often meted out with a view to cow down and bring around the rebellious element."[21]

It was, however, this section of the working people who first began to protest, spontaneously and in sporadic actions, against their extreme economic and social vulnerability. During the late 1930s, Madras government files record the increase of petitions from mirasdars who complained of insubordination on their estates. In cases where the pannayals sustained their struggle, district officers had to intervene and arrive at a compromise wage agreement on a particular estate.[22]

The traditional assemblies of the untouchables, in addition to expressing certain internal features of caste, also provided the basis for militant collective action during the early years of struggle. Since all its members were wholly dependent on subsistence labour, segmentation and differentiation was much less within this caste than within any other village group. Moreover the landlords were used to dealing with them as a collectivity. Gough cites an instance during the late 19th century when Brahmin landlords in retaliation against the demand of a few Pallars for higher wages, expelled the entire caste from the village and replaced them by importing a new sub-caste.[23] The tendency, therefore, was for untouchables to speedily settle any internal differences lest the Brahmin should intervene. The existence of a regular forum was to be an indisputable source of collective strength. All the Harijan men would meet in their temple courtyard every new moon night, and as their militancy grew, the landlords learnt to fear these meetings.[24] There is evidence that such an occasion would be used to tyrannise and threaten the unguarded women left in the Harijan area.[25] In time, however, as the movement grew — and particularly as it sought to draw wider sections of the people into action — these traditional forms of collective organisation made way for the rise of broader mass organisations of the class- and caste-oppressed people.

It was in 1939 that the labourers of east Thanjavur were organised in independent labour unions on a sporadic basis. At the first meeting of the Agricultural Labourers Union (Vivasaya Thozhilalar Sangam), demands relating both to the economic and social vulnerability of the working people were raised. Higher wages, to be paid uniformly in all the taluks, were demanded; so also was abolition of compulsory labour service and of the traditional punishments inflicted on untouchables of whipping and being forced to to and drink cow dung and cow urine. From the beginning, amelioration of the economic condition of the labourers was linked to their social vulnerability as a caste.

The movement began to advance significantly after 1943, when the Communist Party of India planned to work actively in the area. To channel the spontaneous struggle of the labourers, Kisan Sabha offices were opened in many villages of east Thanjavur, particularly in Mannargudi Division, which was throughout this period a centre of inspiring struggle. The untouchables, who formed the bulk of the membership of the kisan sabhas, were encouraged to fight for higher wages, rights over the lands they cultivated, ownership over the service grants of land, and other rights. Between 1943 and 1946, the government was repeatedly forced to intervene and work out a compromise agreement between the mirasdars and the kisan sabhas. It is interesting that, at first, the mirasdars refused even to negotiate at a table with untouchable labourers.[27]

In the face of the rising peasant movement, the landlords began to hire labour from outside the area — not only to supplement local labour, as had been the practice earlier, but to replace the militant peasantry and starve them into submission. To co-ordinate their attack on the peasantry, the mirasdars had activised older associations formed in the 1920s to protest against a raise in the rates of revenue and formed new associations at the taluk and village level. In a new 'co-operative' system, imported labourers would work by rotation on all the big landlords' estates.[28]

The force of the mirasdars' retaliation was, in essence, a measure of the growing strength of peasant unity. By 1946, the struggle was no longer limited to Mannargudi Division. In addition to the demand for a higher wage to labourers and pannayals, the kisan sabhas protested effectively against the arbitrary control traditionally exerted by the landlord over the labourers and working tenants. A landlord was entitled to change his method of cultivation at any time: as a result, a pannayal would be forced to surrender his backyard plot and house-site and tenants would be evicted. The kisan sabhas during the high tide of the movement championed the cause of the sharecroppers too in order to strengthen the fight against landlordism.

The cruel condition of the innumerable sharecroppers in the region was comparable, in certain respects, to the oppressive existence of the pannayals. Often deeply indebted to the landlord, they were forced to perform labour services for him. They were traditionally expected to meet all the cultivation expenses but were allowed only 20 per cent of the crop. Drawn to struggle which had already reaped gains for the pannayals, by 1946 sharecroppers in villages in the taluks of Mayavaram, Kumbakonam and Nannilam, were demanding an increased share of the produce — from the traditional 20 per cent to 50 per cent. The convergent struggles of the labourers and sharecroppers, faced with the obduracy of the landlords in the area, left fallow nearly 30,000 acres of wet land with an average yield of 85,000 bags.[29] Kisan sabha leaders petitioned the government: "In several villages the varamdars have not been given their part of the share of the produce and the entire produce has been taken away by the mirasdars during harvest. Hence these people are made to starve Hired goondas are let loose on the peasants in several villages..."[30]

During the early stages of the movement, the participation in the struggle of new sections of the working people was a matter of alarm for bureaucrats A Magistrate involved in a dispute had noted "For the first time the padayachis [or hired labour] whose position is above that of the Harijans in the social scale but whose economic status is very similar to theirs seem to have made common cause with them, and it also appears that a type of labour leader has arisen in connection with the dispute."[31] The participation of the sharecroppers in the movement was significant since it challenged the structure of ideological and social barriers erected by caste between the caste Hindu peasantry and the untouchable labourers.

A later study describes the process by which a caste, predominantly of peasants, waited for their influential caste headman's decision before joining a newly formed labour union.[32] The caste assemblies of such castes firmly upheld the principles of hierarchy and separation by which the caste system and the practice of untouchability were justified. The participation of untouchables in a labour union was considered defiling and the caste Hindu peasantry was initially hesitant in joining the peasant movement. Traditionally, the headmen of their assembly had been appointed or at least approved by the landlords, and in the particular case mentioned above, the headman vetoed participation in the labour union. 'As the strength of the union grew, however, life made the caste Hindu peasantry more sympathetic to its struggles.'

The intensity of anti-untouchable sentiment among the caste Hindu peasantry of Thanjavur is essentially a reflection of the deep-rooted influence of ideology on agrarian relations — in a highly specific situation where landlordism has been linked (to a significant extent) historically with the Brahmin caste, the custodian of the ideological structure of varnashrama dharma.

It is this aspect of the caste system — varying with greater or less intensity in different parts of the country — which poses a challenge to the development of the democratic peasant movement. On the other hand, it would be interesting to explore the role certain caste organisations or assemblies have traditionally played in defending their members from the excessive oppression of the landlords. For instance, artisans who formed a special category by virtue of their role in the village community and their extensive contacts with their caste members in other villages would negotiate with the landlords to establish regions of work for different groups of artisans. Customarily, the Brahmin landlords could not evict a member of the artisan community without informing the entire community. In contrast, assemblies of castes which were made up predominantly of the peasants might not have been in a position to exert as much independence from the village community, headed by the landlords, to whom they were tied.

The attempts made by the kisan sabhas to widen the base of the movement and to draw the working tenants into struggle was regarded by the popular Congress ministry formed after the war with serious disfavour. Its initial inclination was that it was sufficient to allow the mirasdars to settle the problem without government intervention "The landlords will be able to cultivate the lands with labour imported ... this new experiment on co-operative lines is an experiment worth trying in the present circumstances in view of the attitude of the kisans. Of course the government cannot look on with equanimity the number of cultivators thrown out of employment."[33] But arguing that "the impression that land belongs to the cultivators must be erased from the minds of the people",[34] the Ministry soon came to regard the democratic struggle of the peasantry as a law and order problem to be quelled directly with violence. On the other hand, members of the Congress party clearly felt that it was losing control among a sizeable section of the rural people. In 1947, it attempted to build an organisation of Congress sabhas (particularly in Mayavaram taluk) to wean the working people away from the Communists. According to Collector's reports, they were successful only among the caste Hindu peasantry, while the untouchable labourers continued to support the Communists. The Congress negotiated an agreement on wages with the taluk administration, but the militant labourers refused to accept the landlords' interpretation of the agreement and forced the Congress kisan sabha to launch a strike although the leadership had throughout pleaded for 'non-violent' methods of agitation.[35]

In 1948, the challenge of the Left movement in different parts of the country was met with fierce police force and brutality. That year, the police and armed forces entered Telangana to crush the most advanced agrarian movement in the country. In 1949, the Communist party and many Left trade union and peasant organisations were banned in Madras Province. Notably, the use of force was restricted to areas where the Left movement was strong or influential, among them the eastern part of Thanjavur. The police were still present and kisan sabhas were still banned in Thanjavur when the Tanjore Tenants and Pannayals Protection Ordinance — a gain of the militant struggle — was promulgated in August 1952.

Although the kisan sabhas were able openly to function again only in 1953, Gough portrays the mood of the fighting untouchable labourers, during the period of repression. When police entered to survey the situation in a village, the high caste headman wishing to display his newly re-established control over the village summoned the elected headman of the untouchable landless labourers. "On hearing summons all the landless labourers of the village downed tools and marched to the landlords' street with the communist flag, fearing that their leader might be intimidated or beaten. When they saw

by police trucks, they angrily climbed into them, shouting that their lives were wretched and that they wished all to be taken to prison. In the ensuing melee the police drove off with 80 of them. They were sent to jail in Trichinopoly and held without trial for four months. A deputation of local landlords eventually went to plead for their release so that the harvest work could go on."[36]

The deep roots struck by the Communist-led kisan sabhas among the untouchable labourers during the period of struggle endured through the period of repression and in struggles of the post-independence era. The extreme vulnerability of this section of the people, which drove them to spontaneous struggle against a predatory landlordism, also hardened their unity and made their organisation firm. The loyal and dedicated work of the Communist organisers in this area impressed deeply upon this section of the labouring people the need for organisation and coherent struggle. Over time, this identification has been recognised in the popular title 'Pallar Katchi' or 'Parayar Katchi' (Harijan Party). Problems of the weakening of political organisation, and concentration, reformism, and other related problems which affected the kisan movement throughout India during the post-independence period, inhibited the rapid extension of the movement to other sections of the labouring people and, in fact, even to the western part of the district. Alien ideological influences — particularly those of the political organisations of the 'Dravidian Movement', the DMK and the AIADMK — have posed an active and complex challenge which remains to be effectively met.

In Thanjavur, among other factors, the caste barrier continues to be employed by the rural gentry to divide the agrarian masses. However, it would be highly misleading to assume that caste forms any kind of absolute barrier in the way of the developing agrarian [illegible]. And, meanwhile, this struggle based among a long-oppressed section of the people goes on, an inspiring contribution to the democratic and revolutionary movement in India, seeking to overcome the problems imposed by a complex of historical, political and ideological circumstances and expand its field of activity to the rest of the agrarian masses without whose organised involvement the kisan movement cannot develop further in this region.

Economic Development Corporation

ECONOMIC DEVELOPMENT CORPORATION OF GOA, DAMAN AND DIU (EDC) has been providing to entrepreneurs a package of incentives and services and offering infrastructural assistance to speed up industrial development in the territory. It has adopted a catalytic role to help the units right from conception to the post-production stage. Total number of units set up with the assistance of EDC rose to 251 during the year ended March 1978, as against 194 a year before. The corporation took up Bicholim as a new growth centre with the setting up of an industrial estate by Goa, Daman and Diu Industrial Development Corporation. Through the efforts of business development division 106 commitment were made to the territory during the year. The investment catalysed through this year's commitments was Rs 5.07 crores with employment potential of 3,900 jobs. A project investigation division has been set up with the objective of identifying industrial projects viable in the territory. This division completed 10 pre-feasibility studies out of which five projects were chosen by entrepreneurs for implementation. As at the end of March 1978, total financial assistance rendered by the corporation in the form of share capital contribution and term loans — directly and in joint participation with MSE — reached Rs 3.30 crore-mark. Some 33 units were assisted and a total amount of Rs 67 lakhs was disbursed during the year, bringing the cumulative total of disbursement to Rs 1.16 crores. The industrial service division rendered assistance to different units in matters like obtaining water and power connections, telecommunication facility, housing assistance, etc. An electronic cell has been formed within the Corporation to make efforts in establishing electronics industry in Goa.

in Colonial Period

Gail Omvedt

This paper attempts to survey the history of dalit struggles in relation to the national movement and the communist movement, and to bring to the fore the important role the dalit movement has played in the democratic movement of the country and is going to play in the new democratic struggles in the future.

Communists have to think seriously about the theoretical basis for an immediate practical solution to the problem of caste oppression. This issue is emerging on a national scale today and is taking new forms, where the masses of caste Hindu poor peasants and even agricultural labourers are participating in attacks on dalits under the leadership of rich farmers.

The problem is one of posing a real programme for agrarian revolution; for, what the rich farmers are proposing today (and what constitutes an important basis of their appeal to poor and middle peasants) is their own solution to the agrarian problem and unemployment — a capitalist solution of giving land to the (landed) tiller and employing the rest as agricultural labourers and in small industries.

A concrete alternative has, therefore, to be put forward — a programme which does more than simply ameliorate the condition of dalits as proletarianised agricultural labourers or give them 'waste' surplus land which keeps in view the specific nature of caste relations in the rural area and the need for building a revolutionary unity between dalits and caste Hindu toilers, between agricultural labourers and poor and middle peasants.

THIS article attempts to survey the history of dalit struggles in relation to the national movement and the communist movement, and to bring to the fore the important role the dalit movement has played in the democratic movement of the country and is going to play in the new democratic struggles in the future. Communists have therefore to think seriously about the theoretical basis for an immediate practical solution to the problem of caste oppression. This issue is emerging on a national scale today and is taking new forms, in part heralded by Kanjhawala and Marathwada, where the masses of caste Hindu poor peasants and even agricultural labourers are participating in attacks on dalits under the leadership of kulaks. The problem is one of posing a real programme for agrarian revolution, for, what the kulaks are proposing today (and what constitutes an important basis of their appeal to poor and middle peasants) is their own solution to the agrarian problem and unemployment — a capitalist solution of giving land to the (landed) tiller and employing the rest as agricultural labourers and in small industries. A concrete alternative has therefore to be put forward — a programme which does more than simply ameliorate the condition of dalits as proletarianised agricultural labourers or give them 'waste' surplus land and which keeps in view the specific nature of caste relations in the rural area and the need for building a revolutionary unity between dalits and caste Hindu toilers, between agricultural labourers and poor and middle peasants.

We examine here the dalit movement before Independence, keeping these questions in mind. We attempt to analyse developments in India as a whole, but there is a bias towards Maharashtra partly because of our limitations and partly because the dalit movement under Ambedkar has been the most thoroughly documented.[1]

Dalits in Indian Caste Feudalism

A central feature of the relations of production in the Indian feudal system was that they did not simply bind peasants and other producers to land controlled by feudal lords and to the service of feudal lords. Rather, they bound all toilers to specifically defined occupations and duties according to the kinship group of their birth. Thus, while in feudal societies in general peasants and artisans were such from birth and were considered by blood and birth to be capable only of performing manual work, in Indian feudalism a person born in (for example) a *sutar* family was held to the performance of specifically *sutar* work and was bound to marry only into another *sutar* family. As a result, two hierarchies developed in the traditional feudal system. One was a hierarchy of groups defined in terms of their position *in relation to the land* — ranging from landlords to nominally independent peasants to tenant cultivators in varying stages of semi-serfdom to field servants in varying positions of semi-slavery. The other was a *hierarchy of artisans and service workers* — ranging from certain priests etc at the top down the scale through goldsmiths, barbers, etc, down to weavers, washermen, leatherworkers and others at the bottom, and related to the controllers of the land through the *jajmani* or *balutedari* systems which defined their duties.

Overlaying this, was *the ideology of caste* based on notions of purity and pollution, hereditary transmission of qualities, and ultimately sanctioned by religious notions of service to and exchange with the gods.[2] In terms of this ideology, the bottom level of artisan and service workers were seen as *untouchable* due to the polluting nature of their particular work, such as handling leather, removing dead cattle from village grounds, roles in death and funeral ceremonies, etc. Thus the kinship groups which performed these tasks were defined as untouchable or impure castes and were generally forced to live in hutment settlements that were close to but officially outside the 'village' proper as seen by its other inhabitants. While all castes, except Brahmins, were polluting to those above them, the untouchable castes, in performing the essential tasks of removing the most

polluting elements of the entire society, represented a kind of absolute impurity or pollution that was the polar opposite of the Brahmin's absolute purity.

This, however, is not sufficient to define the structural position of dalits (let alone explain it), and the problem with so many usual analyses of caste is that in limiting their approach to the issues of service work and caste ideology they not only fall into an essential idealism but fail to see the *specific* position of the various dalit castes. To do this we have to further examine the relations of production on the land.

Generally speaking, traditional Indian villages varied between two basic types.[3] In the peasant cultivator or *ryotwari* village, usually found in less fertile and hillier areas, the majority of the popultion were toiling peasants, usually of one caste, who handed over a share of the poduce to representatives of the feudal State — deshmukhs, desais, deshpandes, jagirdars, taluqdars, etc. The State 'administration' was represented within these villages by officials, such as the headman (usually from the main peasant caste) and the accountant (a Brahmin) who had specific rights along with the right to hold rent-free land (*watans* or *inams*). This often allowed the officials to share in the feudal exploitation of the village. In addition, growing economic prospects in ryotwari areas made it possible for landlord estate to penetrate the villages further, as big families bought up *watan* rights as well as land.[4]

In the more fertile plains and river valley areas, *landlord* or *zamindari* villages were generally found. Such villages were controlled by a class of locally-based non-cultivating landlords, often derived from original conquerors of an area or from an earlier family group who had been given the village as a grant. These could be Brahmin or Rajput or high-caste non-Brahmins, and they subordinated the existing peasants as tenant cultivators. Such a class of local lords generally acted as a 'brotherhood', controlling the village and the labour of tenants and agricultural workers collectively, and the village officials of the ryotwari village did not have much importance.[5]

However, in both cases, besides the peasant cultivators, tenants, landlords, and feudal lords, a class of *untouchable field servants* also developed from one of the untouchable service castes. This caste may have had its traditional artisan duty, such as shoe-making or weaving or carrying away dead cattle: these varied, but at the same time its *balute* or *jajmani* responsibilities almost always included performing general menial labour for the village headman and higher State officials (that is, they were the main group bound to feudal labour, or *veth-begar* as it was known in India). Along with this, they performed field labour for the peasant cultivators and landlords and were often bound in a semi-slave status to particular families of cultivators or to the landlord brotherhood as a whole. The field servants were always drawn from *one* particular untouchable caste which was then the largest one in a particular region; such castes included the Mahars in Maharashtra, Malas and Madigas in Andhra, Holeyas in Karnataka, Pallars and Paraiyans in Tamil Nadu, Chamars in western north India, and so forth. Thus, while Chambhars in Maharashtra and elsewhere in south India were *only* leather-workers, Chamars in north India were also and more importantly field servants — their structural position was similar to that of Mahars in Maharashtra, not to the Maharashtrian Chambhars. These field servant castes were not considered by the general feudal ideology to have any rights at all to the land. Yet their own traditions often described them as ancient 'sons of the soil' subjugated by invaders and very frequently their caste duties included a power of decision-making on boundary disputes that implied some sort of primordial connection with the land.

It was the castes of untouchable field servants who were and continue to be the most rebellious of all the untouchable castes. They have provided the basis for most of the militant dalit movements discussed here. In almost all village studies of the contemporary period, there is a report of some attempt by the local untouchable field servants to resist their oppression and reject their degraded position — though such attempts were often failures. In contrast, the other untouchable artisan castes were more traditional, more accepting of the hierarchical order and very often used by the village exploiting classes against the rebellious field servants. The reason is not simply the numerical significance of the untouchable field servants, it is also that their work on the land — even in a position that was often one of semi-slave bound labour — gave them a crucial role in agricultural production that put them in a position which gave them a consciousness to mount at least some rebellion. In contrast, the untouchable, merely artisan castes (rope makers, leather workers, weavers, washermen, sweepers) performed services that could be more easily dispensed with if the peasants and landlords so desired.

In other words, it is the traditional relationship to the land in the feudal system that explains such things as the long-standing differences between Mahars and Matangs or Chambhars in Maharashtra, it also explains why Buddhism and the Republican Party have found a base among Chamars in north India, but not among Chambhars in Maharashtra, why some groups and not others start calling themselves 'Adi-Dravida', etc. An understanding of 'untouchability' *only* in terms of servitude to the land without looking at caste neglects the specificity of the Indian situation. on the other hand, an understanding of 'untouchability' that *only* looks at caste ideology and purity-pollution also faills to analyse the specific features of different groups and, in particular, the basis for the revolt of the exploited which has played the major role in transforming the system.

Finally, a crucial characteristic of Indian caste feudalism was the degree to which it institutionalised *hierarchy and inequality among the exploited* sections.

Within the system, broadly, the *exploiting classes* consisted of the feudal lords (representatives of the State and whatever local officials claimed the State's share of the produce as well as rising feudal families who took advantage of watans etc to build private estates), village landlords where they existed, merchants, and priests. In varna terms, these were roughly the *Brahmans*, *Ksatriyas* (or *Sat-Shudras* in the south where no true Ksatriyas were thought to exist) and *Vaisyas*. Utilising the varna system, however, is a complicated matter since feudal lords and village landlords sometimes had a caste kin relation with other groups of village cultivators. However, if people from 'low' — i e, peasant — background rose to feudal status they generally claimed a Ksatriya status and sought to break off relations with their former lower, kin.

The *exploited classes* included the 'independent' or tenant peasant cultivators, the untouchable field servants and the artisans and other service workers. Among these the peasant cultivators and most of the artisans were defined as *Shudras* in terms of the varna system, while the fields servants and the lowest, or polluting artisan-

service workers defined as impure or *untouchable*. It is the latter — untouchable service castes and untouchable field servants — that we define as dalits in this article. It should be noted that dalits, then, are not exactly equivalent to the category of 'Scheduled Caste' as defined by the government today. For one thing, Neo-Buddhists are still not counted as Scheduled Castes (whereas they are clearly dalits); on the other hand, it seems that in some areas the Scheduled Castes category includes lower level, semi-tribal groups (e g the Rajbanshis of Bengal) who were not dalits as defined here.[6]

It also has to be stressed that, while this traditional system of caste feudalism has left its stamp on the emerging rural class system of today, it is by no means equivalent to it. For instance, modern exploiting classes include rich peasants or kulak farmers who are often drawn from a stratum or section of the middle peasant (Shudra) castes who were among the traditionally exploited classes. Similarly, the term 'untouchable field servants' has been deliberately used because they were not at all the same as the agricultural labourers of today. Modern 'agricultural labourers' include most of the dalits but also include proletarianised members of other untouchable castes (and on this basis radicalism among these castes may proceed fast in the contemporary period) and of some of the peasant cultivators. The dalits in this class are, in most cases, no longer the traditional, bound, field servants and contemporary contract labour or year-labour (*saldar*) arrangements are not equivalent to the traditional bondage.

Colonial Rule and the Maintenance of Feudalism

The important question that emerges then is, what was the impact of British colonial rule on this system? Here it seems clear that, at least until the 1920s, when the struggle of the exploited classes began to make some impact, the main effect of the British Raj was to strengthen Indian caste feudalism.

First, the *political alliance* that British imperialism made with the rural landlords and feudal classes meant by and large a strengthening of their position. Even when new men and new groups gained control of the land (through buying up land or purchasing zamindaris) as a result of commercialisation, they maintained the traditional system of subordinating the exploited classes within the village. Participation in the modern market economy was limited to rural landlords and merchants; tenants from middle peasant castes simply turned over a share of their produce while the dalit field labourers continued to toil as before. Frequently, their traditional servitude became mediated through a relationship of debt-bondage, but the debt did not operate through any modern 'contract' system and particular families of dalits were, as before, considered the traditional servants of particular families of landlords and peasant cultivators. (To take one example, in Thanjavur, in spite of a century and a half of involvement in a commercial economy, it was only after Independence and the struggles of unionised dalit labourers that the traditional system of pannaiyal bondage came to an end, and was replaced by wage-labour forms of exploitation.) Generally, the *jajmani-balutedari* systems continued to operate without much change up until Independence.

British law helped to reinforce this system. For, though it formally discarded caste as a criterion for judgment in general criminal, civil, and commercial law, and formally gave the lowest castes equal access to the law, the policy of non-interference in 'social and religious customs' of the people — a policy stressed in the first statement of the Queen after India formally came under British rule in 1858 — made this relatively meaningless. Religious and ritual restrictions (e g, the exclusion of lower castes from temples) were enforced by the courts, defilement of religious restrictions was treated as a criminal offence and so punished, and courts refused to take action against upper castes who acted on their own to 'discipline' — i e, terrorise and punish — low castes who tried to rebel. Thus, while 'formally' dalits were supposed to have equal access to such public facilities as schools, wells, and roads, they almost always had no economic ability to take their case to court; if they did so, the court was generally not likely to direct effective police action to help them even if it decided in their favour; and if they rebelled on their own and the upper castes exerted social and economic boycott against them, the courts took no action to protect them. Exclusion of low castes from temples and the rights of conservative caste elders to descipline rebellious upper-caste 'reformers' were generally upheld by the courts on the grounds that these were 'private' religious matters. Thus the position of non-interference taken by the British officials and the law amounted in practice to upholding caste hierarchy.[7] Another major example of British working through the criterion of caste was that, when laws were passed in the Punjab to prevent alienation of land to 'non-agriculturalists', this category included not only merchants but also the dalit field labourers! Occasional judgments in support of untouchables were eclipsed by this general tendency, and it is clearly erroneous to see colonialism as imposing a 'bourgeois legal system' on India in terms of abstract enforcement of property rights in land.

What of the *economic* effects of colonial rule? It is often thought that colonialism had a 'dissolving' effect on the traditional village feudal order, that by opening up new avenues of employment and education to people of all castes it provided an opportunity for advance and for breaking traditional restrictions. In reality, the situation was much more complex, and the general effect was to maintain the feudal hierarchy.

It is well known by now that the new professions and occupations dependent on modern Western education were filled overwhelmingly by members of the upper castes — Brahmins in particular but also (depending on the area) by Kayasthas, Parsis, and other groups. It is not so well known — because historians and social scientists have relatively neglected to study the working class — that the same systematic discrimination was true of new industrial jobs. Recruitment to the new factories, plantations, and mines, did not take place as a result of a mass of 'semi-proletarianised' displaced and mobile village peasantry flooding into the cities and being randomly selected for employment. Rather, it was most often structured, through a system of labour contractors (jobbers, sardars, mistris, kanganis). These frequently controlled a gang of workers through debt bondage and recruited them in ways which were geared to the village feudal economy (i e, they both depended on and reinforced village hierarchies). Even where these did not exist, it was often the nature of caste feudalism that determined which groups could have access to certain jobs or which would be willing to take the most arduous employment. As a result, there was stratification among the working

class along caste lines. The most exploited and lowest paid plantation labour was provided overwhelmingly by Adivasis (from Chhota Nagpur to the Assam tea plantations) and dalits (from the Tamil Nadu Kaveri delta to the tea, coffee, and rubber plantations of Sri Lanka. Malaysia and other parts of outh India). Dalits, particularly the field servant castes, such as the Mahars of Maharashtra, also provided labour for such dangerous and low-paid jobs as military service (where this was open to them), the mines, and unskilled labour (gangmen) on the railways. In contrast, the more skilled positions in the new jute and textile factories were filled by middle-caste peasants and tenants (Marathas and Kunbis in the textile mills of Bombay, north Bihar peasants in Calcutta jute mills) as were more skilled positions and more organised positions (even coolies) on the railroads and elsewhere.

Thus from the very beginning, not only was the 'educated elite' composed of higher castes, but *the emerging Indian working class was divided along caste lines*. The old feudal order left its stamp on the emerging capitalist relations of production. In industry as well as agriculture, dalits came to occupy the lowest, most degraded, and most low-paid positions in the working class. The fact that at least some jobs were available outside the village (particularly those on railways, military, etc) gave them a position from which to organise and fight, but the division of the working class posed tremendous problems about the form in which this fight would be carried on.

Finally, in the realm of *ideology*, on the one hand British rule confronted Indians with new ideas of science, equality, and freedom, while on the other it presented them with the sophisticated forms of modern racism which proliferated in Europe with the need to justify colonial rule over third world peoples. In the 'Aryan theory of race', the upper castes (Brahmins, Ksatriyas and Vaishyas) were thought to be descendents of early Aryan invaders while dalits and adivasis were described as descendents of conquered non-Aryan peoples (Dravidians, Mongoloid, etc) and the middle-caste Shudras were considered to be of mixed race in the north and of Dravidian origin in the south. With this went the idea of the cultural superiority of the Aryans and their dominant, if not exclusive, role in defining 'Indian culture'. This theory, originated by Europeans and forming the basis of the way British writers of censuses, gazetteers, etc, understood caste, was picked up by the Indian educated elite who used it on the one hand to justify their own claim to equality with the British (as equally 'Aryan') and on the other to justify their class rights to exploit the 'inferior' lower castes. Thus, traditional, religious-based, notions of the hereditary distinctions between castes were strengthened, if transformed, and were given the backing of 'science' in this modern form of racism.

It is thus not really surprising that it was Ambedkar, of all the delegates to the first Round Table Conference who most fiercely condemned the British government: "Our wrongs have remained as open sores and they have not been righted, although 150 years of British rule have rolled away. Of what good is such a government to anybody? It was a government which did realise that the capitalists were denying the workers a living wage and decent conditions of work and which did realise that the landlords were squeezing the masses dry, and yet it did not remove social evils that blighted the lives of the down-trodden classes for several years".[8] And as he told a dalit conference prior to this, "It is only in a Swaraj constitution that you stand any chance of getting political power in your hands without which you cannot bring salvation to our people".[9] Yet, for dalits more than for any other section of the Indian population, the issue of how the national movement was to be united with the anti-feudal movement and how thoroughly the anti-feudal movement itself would be carried through, was of life and death importance.

Anti-Feudal Tasks of the Indian Revolution

The *specific* characteristics of Indian caste feudalism and the way it was transformed and yet essentially maintained by British colonial rule defined the *specific* anti-feudal tasks of the Indian revolution. We will outline these here as the basis for evaluation and analysis of the movements that took place in twentieth century India.

(1) The most basic anti-feudal task, *the land question*, took on extremely complex features as a result of the Indian caste feudalism. Because of the way in which hierarchical relations were maintained within the village and among the exploited classes themselves, and because of the way in which productive work for the land was institutionalised through the *jajmani/balutedari* system, it was insufficient to look at the land question simply in terms of abolition of landlordism (zamindari, talukdari, khote, inamdari, or whatever). Similarly, the slogan of 'land to the tiller' was abstract and insufficient in the Indian context — and even erroneous, if it was taken to imply that revolutionary land reform could be achieved through giving a cultivating tenant the right to the land. For the fact was that much of the land had *two tillers* — the cultivating middle-caste peasant, whether tenant or ryot, and the dalit field servant, whose connection to the land (if not recognised 'right' in it) was equally long-standing. The very inequality among the exploited institutionalised through the feudal caste hierarchy meant that the need for creating unity in the context of resolving the land question was crucial. It is hard to see how this could be done without a specific programme of constituting poor peasant committees (including dalits as well as caste Hindu toilers) who would have the responsibility of seizing and distributing the village lands and instituting necessary programmes of co-operative and collective agriculture. Otherwise, 'abolition of landlordism', and even the most radical version of 'land ceilings', would simply leave the land in the hands of middle caste peasants at the cost of fully proletarianising the dalit field labourers.

(2) Feudal forced labour in India took the specific form of *veth-begar* which was institutionalised, again, through the caste system, with various duties falling on specific artisan castes but the most arduous manual labour duties falling upon the dalits. Here, again, particular caste-defined responsibilities within the village were connected with the requirements of performing forced labour for higher level landlords and state officials. In practice, the full-fledged abolition of *begar* required the abolition of the *jajmani/balutedari* system.

(3) The creation of a new democratic culture is a crucial anti-feudal task which, in India, required a specific fight against the Brahmanic Hinduism which upheld caste feudalism and against the modern forms of racist ideology which served to back it up and an effort to create the unity of the exploited in the process of this fight.

(4) Finally, because of the way in which the new working class was

formed from within the feudal system, it not only had to lead the central agrarian tasks of the fight against feudalism but also had to fight against the adapted feudal relationships within its own ranks — the caste division of labourers and the Brahmanic culture.

The Rise of Dalit Movements

Though attempts were begun by the dalit castes from the late 19th century to organise themselves, the various sections of the dalit liberation movement really began to take off from the 1920s, in the context of the strong social reform and anti-caste movements which were penetrating the middle-caste peasantry and the national movement which was beginning to develop a genuine mass base. The most important of the early dalit movements were the Ad-Dharm movement in the Punjab (organised 1926); the movement under Ambedkar in Maharashtra mainly based among Mahars which had its organisational beginnings in 1924; the Namashudra movement in Bengal; the Adi-Dravida movement in Tamil Nadu; the Adi-Andhra movement in Andhra which had its first conference in 1917; the Adi-Karnataka movement; the Adi-Hindu movement mainly centered around Kanpur in UP; and the organising of the Pulayas and Cherumans in Kerala.[10]

In most of the cases the Montagu-Chelmsford reforms provided a spark for the organisation of dalits but the crucial background was the massive economic and political upheavals of the post-war period. The movements had a linguistic-national organisational base and varied according to the specific social characteristics in different areas, but there was considerable all-India exchange of ideas and, by the 1930s, this was beginning to take the shape of all-India conferences with Ambedkar emerging as the clear national leader of the movement. The founding of the Scheduled Castes Federation in 1942, and its later conversion into the Republican Party, gave dalits a genuine all-India political organisation — though this remained weak except in certain specific localities and did not by any means constitute the entire dalit movement.

The social reform and anti-caste movements played an important nurturing and facilitating — though often an ambivalent — role in relation to the dalits. Thus the movements in Maharashtra and Madras to a significant extent came out of, and were influenced by the non-Brahmin movements in those areas, especially their radical sections — the Satyashodhak Samaj and Self-Respect movements. The Punjabi Ad-Dharm leaders had nearly all been previously in the Arya Samaj. Brahmo Samaj upper-caste reformers helped to instigate and aid the Namashudra movement and the Adi-Andhras. Dalits in Kerala were influenced and helped by the Ezhava-based movement under Sri Narayana Guru.

In nearly all these cases, the ambivalence in the relationship and the reason why dalits in the end found it necessary to organise on their own, came from the fact that the caste-Hindu-based movements failed to create a really radical anti-caste unity among dalits and lower-middle caste Hindus. The Arya Samaj and non-Brahmin movements in particular aspired to create such a unity and did succeed to an extent in establishing a basis for radical action among sections of the middle-caste peasants. But this proved insufficient. Even here, there was an important difference: the northern-based Arya Samaj never really challenged the 'Aryan' notion or '*chaturvarnya*' as such; rather, it sought to 'purify' the lower castes, whereas the non-Brahmin movements mounted a thorough-going ideological challenge to the whole notion of caste hierarchy as such and sought to create a mass unity on the basis not only of modern secularism and scientific thinking but also in terms of being once-united original inhabitants of the country (the 'Aryan theory' turned upside down).

Thus, whereas the Punjabi Ad-Dharm movement broke with the Arya Samaj both organisationally and ideologically (though the Arya Samaj itself continued to foster some anti-untouchability activities), the dalit movements of the south and west accepted and even carried forward the general ideology of the broader non-Brahmin movements but criticised the middle-caste non-Brahmins for betraying this ideology and falling prey to Brahmanic culture as well as to pure self-interest in gaining government jobs and posts. And this criticism was not wrong. For, the middle position of the non-Brahmins — in particular those whose claims to land and access to higher education gave them the potential of becoming the privileged classes in the developing capitalist society — made their opposition to feudalism an ambivalent one. Thus they became 'anti-Brahmin' more than 'anti-caste'. And, in the important case of Maharashtra, by the time the non-Brahmin peasant movement joined the national movement it did so by almost surrendering to the upper-caste and bourgeois leadership of the National Congress, not by maintaining its own social radicalism or any separate peasant organisation. The isolation and 'separatism' of the dalit movements was thus forced on them.

Thus, in Maharashtra, Ambedkar's movement developed with support from leaders such as Shahu Maharaj and with many activists coming from the Satyashodhak movement and out of schools founded by non-Brahmin leaders. Ambedkar frequently referred to himself as a 'non-Brahmin' (not simply as 'untouchable') scholar, and became a spokesman in the legislative assembly for all the non-Brahmin ('backward' and 'depressed classes' in British terminology) groups. His Marathi speeches often used the *shetji-bhatji* terminology of the Satyashodhak movement. Yet he consistently criticised the opportunism of non-Brahmin leaders and, in the end, after the non-Brahmin movement was absorbed into the Congress party under Gandhi's leadership and its radical elements forgotten, the separatism in Ambedkar's movement came to dominate.

In Madras, educated dalits were part of the Justice Party; but a rift grew after the party won power, partly stimulated by disputes in a textile mill strike and partly due to charges that the Justice Party was not giving sufficient representation to them but was monopolising posts for higher caste non-Brahmins. M C Rajah, the most prominant untouchable leader, withdrew with his followers, though after this many participated in E V Ramasami's Self-Respect movement which represented the more radical thrust of the non-Brahmin movement.

In Punjab, the young educated Chamars who founded the Ad-Dharm movement had first been in the Arya Samaj, attracted by some of its ideals which held open the promise of purification (*shuddhi*) to the low castes, then became disillusioned by the control of upper castes in the movement and rejected completely the paternalistic implication of *shuddhi* that untouchables *needed* to be 'purified'. The pattern of these regional configurations needs to be more thoroughly studied.

But, in contrast to the *ambivalence* of the dalits' relations with caste-Hindu-based anti-caste movements, their relationship to the national movement was, even worse, an *antagonistic* one. The

fact was that, with the notable exception of Kerala where the Congress leaders themselves undertook anti-caste campaigns, almost everywhere the Congress leadership was in the hands of upper-caste social conservatives who were often not simply indifferent to dalit demands but actively resisted them. Thus dalit spokesmen were inclined to argue that "British rule was preferable to Brahmin rule" and to look for any means — special representation, separate electorates, alliance with Muslims — that might prevent them from being swamped by caste Hindu nationalists. It has to be stressed that this alienation from the organised national movement (the Congress) was not just the result of the self-interest of a few leaders but was a widespread opinion wherever dalits were organised on militant lines, and that the Congress leadership up through the time of Independence did almost nothing to heal the split and build up dalit confidence and unity. Though dalits under Ambedkar did take a nationalist position, it was as a result of their own conviction that Independence was necessary.

Ideologically, in spite of their very diverse origins, it is remarkable how many themes the dalit movements shared in common. Central to their thinking was the *adi* theme, a definition of themselves as the original inhabitants of the country, a claim that their own inherent traditions were those of equality and unity, and a total rejection of caste (*chaturvarnya, varnashrama dharma*) as the imposition of the conquering Aryans who used this to subjugate and divide the natives. Very often, this went with a rejection of Hinduism as the religion of the invaders and the main support of caste society. Ambedkar's movement was the most important one that did not stress such an *adi* identity, yet the theme was still a strong one among Mahars. Ambedkar himself, in initiating the later conversion to Buddhism was in a way doing the same thing — rejecting Hinduism and attempting a return to an 'original' and equalitarian Indian religion. Along with this went a strong secular and rationalist stress on equality, the necessity of modern education, the rejection of traditional superstition and traditional ritual subordination.

These movements then organised struggles in various ways over the rejection of all the forms of feudal bondage imposed on dalits. The most spectacular mass campaigns in the 1920s were efforts at the ritual level, i e, to break down the restrictions barring dalits from use of common temples and water tanks. The biggest, and very carefully planned, campaigns took place in Maharashtra (the Mahad tank satyagraha of 1927 which culminated in the burning of the *Manusmriti*, the Parvati temple satyagraha of 1928, and the Kalaram temple satyagraha in Nasik of 1930-35) and in Kerala (the Vaikom temple road satyagraha of 1924-25 and the Guruvayoor satyagraha of 1930-32). (The differences here are crucial too: the Kerala satyagrahas were planned by radical Congressmen of varying castes and met with some success with the Travancore temple entry declaration of 1936; the Maharashtra satyagrahas were planned primarily by dalits though with some caste Hindu support, met with no success, and were finally halted by Ambedkar on the grounds that he had no wish to integrate into Hinduism anyway.) But it seems that, wherever dalits organised militantly, there was always some direct action or threat of it after Ad-Dharm rallies "people would swarm into the village bathing tank and use it in defiance of upper caste prohibitions"[11] and, during early Adi-Andhra conferences caste Hindus closed temples completely for fear of entry attempts.[12] Also at a symbolic level was the adoption of particular forms of dress in defiance of feudal 'consumptuary' rules in which the upper castes tried to prohibit untouchables from wearing fine clothes: the followers of the Ad-Dharm wore red turbans and sashes which, up to then, had been only a high-caste colour; low castes in Tamil Nadu and Kerala claimed the right to cover their breasts which they had not been allowed to do previously, and so forth.

In terms of economic relations, the movements and struggles centered around two themes. On the one hand was the growing refusal to perform the traditional caste duties, carrying away dead animals, playing music at funeral ceremonies, performing forced labour for village headmen and government officials, a battle that was fought in countless ways under varying auspices in countless villages and never totally won. Ambedkar's long struggle to abolish the Mahar *watan* was an expression of this.

This was the direct fight against feudal forms of bondage within the village. Related to it was the struggle for education and employment; for, by and large, dalits saw their opportunity, the positive alternative to the negative fight against feudal bondage, in escaping from the village to 'modern' industrial and service employment. (*Why* this was true is usually understood in terms of the middle-class nature of dalit leadership, but just as true was the weakness of the general peasant movement and its inability to pose the land question in such a way that dalits could see a real possibility of gaining within the village.) Thus the movements were highly involved in founding schools, hostels, and other educational associations; and they consistently demanded fellowships, positions in existing educational institutions and reserved government jobs. The final outcome of this was the system of 'concessions' which has become so controversial today. It is important to note that such concessions were necessary, because existing caste discrimination (caste and kin-based recruitment pattern and the cultural as well as economic disabilities of the low castes) had resulted in a heavily divided working class. Breaking down this division, fighting the feudal relations that had stamped themselves on the emerging classes of the capitalist system, was necessary to *build* the unity of the working class and of the Indian people in the fight against colonial rule. But the nationalist leaders and the working class leaders (the communists) rarely saw it this way. As a result, rather than the class itself fighting to build its unity, or the people organised under national leadership taking up consciously the fight against feudal relations, the dalit movement was isolated and, instead of becoming a vanguard part of the anti-feudal and anti-imperialist movement, fell into the position of asking for concessions from the nationalists as well as from the British.

This, then, brings us to the relation of the dalits to the national and communist movements, and the related question of how the issues of *power* and *land* were posed in colonial India.

Dalits and the National Movement: The Issue of Power

"We want to become a ruling community", was a saying of Ambedkar, and in fact the drive to achieve power or a share in power was seen by him and by many not simply as the negation of the extreme feudal subjugation of dalits but as the basis for achieving any other kind of gain. But, because the

national movement did not consciously organise to build alternative revolutionary systems of power in which dalits would find a place, this demand for a share in power became expressed in the demand for special, separate representation within the bourgeois parliamentary forms being institutionalised in India. An additional motivating fact was the strong feeling among dalits that they must represent themselves, that caste Hindus could not be trusted to represent them (nor for that matter could the British government), that the nature of caste and class conflict was so great that no caste Hindus could speak for their interests.

The conflict took specific form in the dalit demand for *separate electorates* (constituencies only of dalits choosing dalit representatives to the parliament) *versus* the original nationalist unwillingness to concede anything until finally a 'compromise' of *reserved seats* (dalit representatives chosen by general, i e, caste Hindu plus dalit, constituencies) was forced on them. The issue here was different from that of separate electorates for Muslims because there was at no point a dalit demand, or the possibility of a demand, for a separate homeland. Rather, the question was one of *how* to achieve the unity of the Indian nation. Gandhi's firm opposition to separate electorates, too, had nothing to do with the threat to Indian unity but rather the threat to *Hindu* unity and came from his religiously motivated insistence that dalits were part of the Hindu community. It might also be added that the idea of separate electorates, or 'functional' representation of specific social groups or classes, was one that went beyond bourgeois democratic forms entirely and in a sense could be seen as an aspect of proletarian democracy, whereas reserved seats not only allowed caste Hindu control of dalit political representation (as Ambedkar so bitterly and effffectively established in "What Congress and Gandhi Have Done to the Untouchables") but also proved an ideal method for the bourgeois State to absorb and negate the dalit movement, giving dalits some semblance of power within the bourgeois framework but at the cost of giving up militancy. The issue, however, was very rarely seen in this way. Instead, considerations of power prevailed (the upper class/caste drive to control the legislatures through control of Congress, and the fact dalits did not simply have the same political clout as Muslims); the demand for separate electorates was seen by most non-dalits as one leading to separatism and disunity.

Since the conflict between dalits and the Congress nationalists was embodied in the relation between Ambedkar and Gandhi, especially over the issue of separate electorates climaxing in the 'epic fast' of 1932, it is worth examining this in some detail. Ambedkar, unlike most dalit spokesmen, was not throughout a proponent of separate electorates. Though, along with nearly everyone else, he called for them in 1919 in testifying before the Southborough Committee, during the 1920s he turned away from them. Apparently believing they would lead to disunity, he argued against them before the Simon Commission. The 1920s, it should be noted, was not only the decade of the real upsurge of dalit movements as mass movements; it was also the greatest period of co-operation between Ambedkar and caste Hindu social radicals (i e, the non-Brahmin movement). This may well have given Ambedkar some confidence that separate electorates were not necessary. The Nagpur Conference of Depressed Classes in 1930, just before Ambedkar left for the first Round Table Conference, was in a sense a landmark: Here Ambedkar became the first major dalit leader to state forcefully the need for Independence as the minimal basis for solving dalit problems, and he stated publicly that he would be satisfied with reserved seats as long as there was adult suffrage.

Then, at London, he completely reversed his position and asked for separate electorates (at this conference too, it should be added, with the Congress absent he was the most forceful spokesman for Indian Independence). By the time of the second Round Table Conference this attitude had hardened to produce the major confrontation with Gandhi. Why?

Two reasons that have been suggested are that the unanimous dalit opinion, aside from Ambedkar, was in favour of separate electorates, and that Ambedkar felt bound to represent this; and Ambedkar's personal experience of Gandhi's hardline and even arrogant attitude[13] which rejected not only separate electorates but even reserved seats. To this it may be added that, by 1930-31, the mass of the Maharashtrian non-Brahmins were moving into Congress in a form that meant an essential abandonment of their own independently based social radicalism and a (temporary) acceptance of upper-class, upper-caste Congress leadership.

What then of Gandhi? Here it is worth noting that, when Ambedkar and Gandhi met for the first time in 1930, Ambedkar not only felt he had been treated rudely, but Gandhi himself admitted that he had not known that Ambedkar himself was a dalit but thought rather that he was a Brahmin social reformer aiding the untouchables! In other words, Gandhi had not only done substantially nothing himself on the issue of untouchability up to this time, but he betrayed a crucial ignorance of the movement which had been going on for over a decade and of its leadership. Indeed he unwittingly betrayed his assumption that dalits themselves were incapable of doing much on their own or of producing their own leadership.

Ambedkar, therefore, insisted on separate electorates. Gandhi insisted equally adamantly that dalits were Hindus and must be represented by Hindus as a whole (and was met on his return from London by a black-flag demonstration of 8,000 Bombay dalits).[14] The British Communal Award gave Ambedkar his separate electorates; and Gandhi undertook his fast-to-death in protest. Here again it has to be stressed that this first fast over the 'issue' of untouchability was not a fast against the British for nationalist causes or against the oppressive caste system, but was a fast against dalits themselves to force them to give up their demands. Ambedkar conceded — knowing that if Gandhi died there would be massive reprisals on his people throughout India — and the result was the Poona Pact of September 25, 1932, which as a compromise gave dalits the reserved seats that Ambedkar had demanded in the first place. For dalits and for Ambedkar, the lesson was clear: not a faith in the ability of satyagraha to 'change the hearts' of caste Hindus, rather that only by fighting for their rights would dalits win anything at all.

After 1932, Gandhi made 'untouchability work' a major programme of the Congress and for many a crucial moral part of the Indian national movement. And yet Gandhi's essential paternalism and insistence that above all dalits were Hindus remained in the choice of the term 'Harijan', in the insistence that caste Hindus and not dalits should control the Harijan Sevak Sangh. However 'radical' Gandhi's own views on caste became (in approving of inter-dining and inter-marriage, for example), he never dropped the belief in *chaturvarnya* or the idea that children should follow their fathers'

professions, themes that stood in direct contradiction to the anti-feudal principles of the dalit movement. Even worse, anti-untouchability became identified with the Gandhian, that is the conservative, wing of the Congress and remained a distraction and diversion to the radicals within Congress (and for that matter the communist Left) who never developed a programme of their own on the issue of caste.

It seems fair to say that, essentially, the British raj did nothing to transform caste feudalism or to alleviate the worst aspects of untouchability. Whatever steps were taken came in the transition period between the wars when concessions were being given to Indian nationalists. And whatever steps the Indian nationalist leadership took came as a response to dalit struggles. In 1917 — after the first 'depressed classes' conferences were organised in Bombay, and dalits as well as non-Brahmins made prosposals for separate electorates — the Congress reversed its policy of excluding 'social reform' and passed a resolution urging upon "the people of India the necessity, justice and righteousness of removing all disabilities imposed by custom upon the Depressed Classes". In the 1920s, the *governments* of Madras and Bombay (controlled or influenced by non-Brahmin organisations) passed resolutions confirming the rights of dalits to equal use of government facilities, schools, and wells; so did several progressive princely states. These did little, however, to provide reinforcement, and remained almost totally ineffective. In 1931, the Karachi Congress session propounded a programme of fundamental rights which called for equal access for all to public employment etc, regardless of caste, and equal right to use of public roads, wells, schools, and other facilities. Temple entry bills were introduced between 1932-36 in the Central Assembly, Madras and Bombay legislatures and generally met with opposition from both the government and conservatives in Congress. Baroda and Travancore states proclaimed temple entry in 1933 and 1936. In 1938, after Congress legislatures were elected, temple entry bills were passed in Madras and Bombay.[15]

But the full and formal 'abolition of untouchability' had to wait until Independence. In 1946, the Scheduled Caste Federation fought for the reserved seats but lost heavily to 'Congress Harijans' in strongly nationalist and caste-Hindu-dominated constituencies. As a result, the movement suffered a blow and dalit demands were ignored in the final settlements and in the traumas of the Hindu-Muslim holocaust. The Scheduled Caste Federation then launched satyagrahas in Bombay, Pune, Lucknow, Kanpur, and Wardha, demanding that the Congress make known their proposals for giving rights to dalits; the satyagraha forced the abrogation of the Pune session of the Bombay legislative assembly and a compromise meeting with Ambedkar in July.

Against this background, the Constituent Assembly met. Its resolution that "Untouchability in any form is abolished and the imposition of any disability on that account shall be an offence" was in line with the development of the Congress movement in the last 25 years.[16] But the system of 'protective discrimination' — i e, reserved positions for Scheduled Castes and Scheduled Tribes in government service and educational institutions — was not at all in line with Congress (or Gandhian) thinking and so was, even more clearly than the nationalist response to dalit struggles, a result of the dalit movement itself.

Dalits and the Left: The Issue of Land

The relation between the dalit movement and the emerging communist and Left movement was, unfortunately, little better than that with the national movement. The Left evolved no programme of its own, regarding the abolition of caste. And, in regard to working class organising, a history of antagonism was built up. The major exception was in fighting feudalism in agrarian relations where the All India Kisan Sabha (AIKS) programme did make an important contribution. This, however, remained partial and isolated from the organised dalit movement.

In terms of the working class, the position of dalits as unskilled workers in the most dangerous and difficult to organise jobs put them in the position of potential antagonism to other working class organising — in the sense that they were often ready to act as strike-breakers in the hope of getting higher-level jobs (the same phenomenon could be seen elsewhere where groups were excluded and so given no opportunity to develop working class solidarity, e g, among US blacks prior to World War I), and in the sense that they were inclined to form separate unions.

Thus dalit willingness to return to work first in a dalit-caste Hindu 1921 mill strike in Madras provoked violence and a conflict with the Justice Party. Dalits were part of the major 192 Bombay textile strike which brought communists to the leadership of the working class movement. But when a second strike was called in 1929, Ambedkar not only opposed it but attempted to actively organise dalit strike-breakers. His reasons were the special hardships imposed on the economically weaker dalits by the earlier strike and the fact that the working class leaders had taken no stand regarding the barring of dalits from the better-paid weaving department.[17] On the other side of what proved to be an enduring hostility between Ambedkar and the communists, it has to be emphasised that the communists concentrated their attempts on militant economic gains, on organising the working class in its fight for survival, rather than attempting to put it in the leadership of the anti-imperialist and anti-feudal struggles. The latter, as we have emphasised, meant not simply that workers should give leadership to a peasant movement but that the working class itself should fight to break down the feudal *within* it that held dalits down. Yet nothing was done by AITUC on the caste issue and in the Bombay textile industry, where "the red flag was planted in the Indian working class" 50 years ago, dalits remain barred up to the present from (non-automated) weaving departments.

The most central aspect of the anti-feudal struggle for dalits and for other toiling peasants was, however, the land issue and village economic relations. Here, the work of the Kisan Sabha becomes crucial. By the late 1930s and 1940s, the AIKS had become a force in several areas — most especially Bihar, Andhra, Kerala, UP (in a sense, for, Kisan Sabhas here remained outside the AIKS for a long time) — and made a conscious and revolutionary effort to evolve an all-round anti-feudal programme that would be in the interests of poor as well as middle and rich peasants.

But the gaps were crucial. The top AIKS leadership was almost entirely of non-peasant origin; even though peasants came to be crucial as cadres these were overwhelmingly drawn from caste Hindu middle-rich peasants even at a time when the AIKS was attracting more and more poor and low-caste peasants; partly perhaps because of

this and partly because of the strenuous pace of organising, there was little formulation of the Indian problem in Indian terms and abstract class categories were simply borrowed, usually from European thinking. The AIKS did not pass a resolution on untouchability until 1945,[18] and never really considered cultural level struggles of importance (this applied also to the role of women). Opposing feudal 'forced labour' was a major element of Kisan Sabha programmes but this was never analysed in its specific expression through caste bondage.

This, in itself, may not have been of overwhelming significance. After all, the fact that forced labour was actively opposed was of crucial significance to the dalit toilers who took part — and were apparently a major part of the Telengana rebellion. This may be one of the reasons for the enthusiastic mobilisation of dalits, who reportedly provided the major element of the armed squads.[19] The most important failure of the AIKS was at a different level: It lay in the way it formulated the land question itself.

For the AIKS, 'land to the tiller' was the central anti-feudal demand, and it was expressed mainly in terms of *abolition of landlordship* (zamindari, taluqdari, khoti, jenmi, malguzari, etc). Along with this, ryotwari peasants were to be freed from indebtedness to money-lenders and from government over-assessments. Lower-level feudal relations within the village seemed to be invisible to the AIKS. A category of 'agricultural labourers' was identified and this presumably included almost all dalit toilers, but they were seen in European terms as peasants dispossessed of the land. The Kisan Sabha leadership was ambiguous about their inclusion, but where they argued for unity of interest between 'kisans' and 'agricultural labourers' it was in terms of the fact that middle-poor peasants were rapidly becoming impoverished, losing lands, and becoming landless labourers. The special, traditional, position of dalit field servants with their hereditary connection to the land was simply not taken note of.

A 1947 AIKS resolution on the abolition of landlordism stated: "All agricultural labourers must have a minimum wage. All other tillers of the soil must get proprietary rights in it under their direct cultivation, and cultivable waste land must be distributed among poor peasants and agricultural labourers".[20] Thus, while dalits here were somewhat ambiguously seen as 'tillers' they were *not* considered to have any rights in the land at all; only their wage interests were to be protected and their land hunger satisfied by leftover — i e, 'waste' — land. Thus, in spite of the participation of poor peasants and landless toilers in Kisan Sabha agitation, it is *not surprising* — because only middle-caste cultivating peasants were seen as having rights in the land — that the end result was land reforms which even in their most radical version (e g Kerala) have benefited rich peasants. 'Land to the tiller', then, systematically excluded dalits.

On the other side, the dalit movement itself also took up the issue of land, but in an equally partial way. Campaigns against *veth-begar* and specific menial and degrading caste duties (carrying away dead cattle, serving officials) were, as noted above, an important part of the movement and were, of course, equivalent to the AIKS opposition to 'feudal forced labour'. But generally these were undertaken by the dalit movement in such a way that the alternative was seen, not as revolutionary land reform in the villages or transformation of the villages, but rather as moving from the villages altogether to new jobs in industry and service. The inability to see any real opportunity for advance within the village was, of course, realistic in the absence of a revolutionary movement.

No direct struggles for land for dalits were apparently taken up before Independence, but as far as Ambedkar at least was concerned it seems the issue of land was always present. Again, though it was a question of looking beyond the village, in one of his earlier meetings he argued that dalits should look for land for colonisation. In later meetings, he considered the possibility of settlements in Sind.[21] The climax of this, however, came in 1942 at the conference which founded the Scheduled Caste Federation when a resolution was passed on separate *village settlements*. This was a demand that dalits from all the villages in one area (later sometimes specified as a taluka) should be given land (to be provided both from unoccupied government land and from land bought up by the government for the purpose) so that they could form independent settlements of their own.[22] This has come to be known as the 'dalitstan' demand. But the term is something of a misnomer for it is not really a demand for a dalit *homeland* but rather a way of *posing the land question* for dalits. In contrast to the Kisan Sabha, here it is implicit that dalits *do* have rights to land, and not only to 'waste'. But the emphasis is still on moving away from the villages; and, because this land demand was not linked to a proposal for agrarian revolution, it served instead to pose the interests of dalits against those of all caste Hindus and appeared as a totally utopian proposal around which it was impossible to organise struggles. Yet the continual survival of the idea undoubtedly lies both in the land hunger of dalits and their continued feeling of insecurity as a village minority.

Ambedkar's final thoughts on the land question, however, were on very different lines. Urging State Socialism, he argued that "Neither consolidation [of land holdings] nor tenancy legislation can be of any help to the 60 millions of untouchables who are just landless labourers. Only collective farms can help them. ... Agriculture shall be a state industry. Land will belong to the State and shall be let out to villagers without distinction of caste or creed and in such a manner that there will be no landlord, no tenant, and no landless labourer."[23] For an avowed anti-communist and a stern critic of Indian 'socialism' it was an impressive programme. What was lacking, of course, was an idea of how it might be achieved.

In the end it seems that, however anti-communist or anti-nationalist dalit leadership might be, the dalit movement remained consistently radical on the land question. It was Ambedkar who proposed a bill and led a march in 1936 for the abolition of the *khoti* system in the Konkan, and attempted to arouse Mahars in opposition. In Bengal, the Namashudras allied with Muslims against the Hindu *bhadralok* nationalists — not simply on opportunist grounds but on a programme of which the central feature was abolition of zamindari, and the Scheduled Castes withdrew their support when this programme was reneged upon.[24] The organised dalit movement was inevitably a radical force for agrarian revolution and not just for the abolition of 'cultural' aspects of caste bondage. But, in the absence of integration into an all-round peasant movement, this force could have little impact in the rural areas before Independence.

Conclusion

One of the most striking features of the anti-feudal movement in colonial India was its fragmentation — a fragmentation which reflected the divisions among the exploited sections that were so characteristic of Indian caste feudalism.

While social reform and anti-caste movements arose throughout India, and all provided some kind of ground for dalits to begin to move ahead, the non-Brahmin movements of south and west India posed a genuine possibility of a radical movement against caste traditions that could unify both caste Hindu toilers and dalits. Their ideology itself and the principles of their most radical organisations — the Satyashodhak Samaj and the Self-Respect movement — posed a thorough challenge to caste hierarchy and in fact provided the central ideological themes for the dalit movements. But such unity did not materialise as the more conservative wing of these movements gained strength among caste Hindu peasants and educated sections.

It might have been expected that a national movement, dominated by bourgeois and upper-caste forces would prove resistant to dalit demands and respond only in a nominal and co-opting way. Most serious really was the failure of the Left to provide a radical and unifying anti-feudal alternative The communists organised the working class in its struggle for survival and at points this organisation aided the lowest sections of that class, but they failed really to put the working class politically in the leadership of the anti-feudal movement and as a result the class remains divided and the organisation benefited mainly its skilled and more upper-caste sections.

Kisan Sabha organising, in its areas of strength, benefited dalits more directly The fight against feudal forced-labour struck at bondage within the village, the organisation of agricultural labourers, which had its beginnings in the 1940s, also involved a challenge to feudal servitude: as a Kerala landlord put it, "His body and his father's body are my property and he dares to ask for wages Is it rights?[25] The demand for giving cultivable waste land to agricultural labourers and poor peasants, though a partial one, proved to be the main form around which dalit struggles for land took place, particularly after Independence. And yet this was insufficient. In failing to pose the land issue in a July revolutionary and thoroughgoing way, the Kisan Sabha gave no defence against the real alternative programme to what became an essentially bourgeois land reform and offered no way to prevent its most militant agricultural labourer unions from being caught in the trap of economism in the post-Independence period. The connection between agrarian revolution and the wage-based organising of labourers remains problematical.

Indian communists thus failed to formulate a programme for a revolutionary anti-feudal movement which could unify the exploited, which could take up cultural and political as well as economic issues, and which could pose a real *alternative* to bourgeois land reform ('abolition of zamindari'), bourgeois notions of 'uplift' of depressed groups, bourgeois separation of 'cultural' and 'economic' factors, and bourgeois strategies of creating and absorbing an educated elite among the downtrodden sections.

This was not simply a case of being relatively weak, or of being unable to take *leadership* of the national movement away from bourgeois upper-caste nationalists. It may well have been impossible to organise a struggle for a full-scale agrarian revolution or do more than fight on partial demands linked to it. The problem was that the agrarian revolution was never really posed. The Left was unable to appear before the people as anything more than devoted organisers of the working class on economic demands and (with the exception of 1942) more militant anti-imperialists.

It was in this context that the dalit movement developed before Independence as an isolated revolt of the weakest and most oppressed sections of the population. The isolation had serious consequences; for it meant that, instead of organising as the most revolutionary section of a unified movement, dalits developed a separatism in which they 'made demands of' nationalists as well as the British. A hostility developed to communism and class analysis (which was put forward in such a way as to appear to dalits to exclude considerations of 'caste' as such), which continues to have serious consequences today.

Still the achievements of the dalit movement are impressive, and are too often overlooked. They have given birth to a tradition of struggle in many areas, not only on cultural and ritual issues but on breaking feudal bonds. They have mounted powerful pressure on the national movement resulting in constitutional provisions for reservations and laws making untouchability an offence; unsatisfactory as these have been, they have still provided weapons in the hands of low-caste organisers. They have created a deep-seated conviction of equality and self-confidence which is inevitably making itself heard. If this has not yet achieved a revolutionary transformation in the life of the most exploited sections of society, it is because of the incompleteness of the revolutionary and democratic movement itself. If this is to go forward, the dalit movement will inevitably be a part of it.

Notes

[We would like to thank those who have contributed to this initial formulation in particular Datta Chakre.]

1 There are still limited studies of the existing dalit movements and some existing works have been unavailable to us. But among important sources are the 'tribes and caste' studies of the British period (Thurston, Blunt, Enthoven etc) which give some ethnographic data on the various castes. Contemporary village studies which give detailed data about social relations in the villages studied are also very useful, whatever may be the theoretical bias of the authors. The most useful collection on dalits, though somewhat dated, is J Michael Mahar, *ed*, "The Untouchables in Contemporary India" Tucson, Arizona: The University of Arizona Press, 1972. Among these, in terms of the dalit castes studied, can be included: J Michael Mahar, 'Agents of Dharma in a North Indian Village', in Mahar, "The Untouchables ..."; Oscar Lewis, "Village Life in Northern India", Vintage Books, 1975 M C Pradhan, "The Political System of the Jats of Northern India", Oxford University Press, 1966. (all on the Chamars); Andre Beteille, "Caste, Class and Power", Bombay: Oxford University Press, 1969; Kathleen Gough, 'Harijans in Thanjavur' in Gough and Sharma, *ed*, "Imperialism and Revolution in South Asia", New York: Monthly Review Press, 1973, and 'Colonial Economics in Southeast India', *EPW* March 26, 1977 (both on the Pallas in Tamil Nadu); Joan Mencher, 'Continuity and Change in an ex-Untouchable Community of South India' in Mahar, "The Untouchables", and 'The Caste System Upside Down, or The Not-So-Mysterious East' in *Current Anthropology* December 1974; and Marguerite and Stephen Barnett, 'Contemporary Peasant and Post-Peasant Alternative in South India: The Ideas of a Militant Untouchable' in *Annals of New York Academy of Sciences*, 1978, (on the Paraiyans in Chingleput district,

Tamil Nadu); T Scarlett Epstein, "Economic Development and Social Change in South India", India: Manchester University Press, 1962 (*on the Holeyas or Adi-Karnatakas*), F G Bailey, "Caste and the Economic Frontier", Manchester University Press, 1957 (the Pans of the Kondmal Hills, Orissa); and Jan Breman, "Patronage and Exploitation", University of California Press, 1974, and 'Mobilisation of Landless Labourers Halpatis of South Gujarat' in *EPW*, March 23, 1974 (on the Dublas or Halpatis of Gujarat).

Studies of specific dalit movements are still rare, but *include* Eleanor Zelliott's many works on the Mahars; a forthcoming book by Mark Juergensmeier on the Ad-Dharm movement in the Punjab and Owen Lynch, "The Politics of Untouchability", Vintage Books, 1966, on the Chamars/Jatavs in Agra.

2 See Louis Dumont "Homo Hierarchicus", *1970*, and McKim Marriott and Ronald Inden, 'Caste Systems', "Encyclopedia Britannica", 1974

3 For a useful discussion, see Eric Stokes, "The Peasant and the Raj" (Cambridge University Press, 1978), Introduction and Chapter 2.

4 These types were often modified however, for instance, as Frank Perlin shows for 17th century Maharashtra, feudal states were *often organised* by big families buying up various types of watan and inam rights, it is thus crucial to look beyond the purely formal definition of rights for any complete analysis

5 For an excellent description of such a system see Gough, 'Colonial Economics in Southeast India'.

6 See e g Swami Mitra, who records over 100 villages where two-thirds of the population were Rajbanshi and Pods who were not only sharecroppers but also jotedars, this, of course, is not a 'dalit' type of situation, 'Sonarpur A Peasant's View of the Class War' in *South Asian Review* October 1975. The situation in Bengal in many ways seems anomalous and needs closer study.

Trade Unionists in Tunisian Prisons

SOME of Tunisia's most distinguished trade union leaders are now languishing in the Civil Prison in Tunis, according to Amnesty International. Among them is Ismail Sabhani who, until the time of his arrest in January 1978, was the Secretary General of the Tunisian Federation of Metalworkers. He is now serving a sentence of five years' imprisonment with hard labour, after being tried with other trade union leaders by the State Security Court in Tunis in October 1978. (Altogether, 30 members of the Executive and Administrative Committees of the General Union of Tunisian Workers — UGTT — faced charges of conspiracy against the internal security of the State.) Sabhani was arrested after the UGTT had called a one-day strike on January 26, 1978.

The one-day general strike, which led to the arrests of the trade union leadership and thousands of their members, was the culmination of union criticism of the Tunisian government's economic policies. In January 1977, a social pact had been agreed to by the unions and the government. The government would improve working conditions and guarantee fair wages; the unions undertook to encourage increased productivity and not to strike. But by the end of the year, prices of basic commodities, including food, rose while wages failed to keep pace Dissension within the government of prime minister Hedi Nouira led to the formation of a new cabinet in December 1977 which adopted a harsh line in dealing with trade union opposition to government policy.

At the State Security Court trial, the state prosecutor demanded the death penalty for all the 30 defendants The original 76 lawyers for the defence withdrew from the court in protest against the conduct of the trial, 24 of the defendants were convicted, and the sentences ranged from 10 years imprisonment with hard labour to a six months' suspended sentence At least 12 other trade unionists are still awaiting trial before the State Security Court.

Caste and Class in Maharashtra

Nalini Pandit

Classes in Marxist theory are not mere economic categories. They are living social groups whose attitudes and responses are determined by historical and cultural factors. The materialistic interpretation of history does not imply an exclusive emphasis on the economic factor to the comparative neglect of others. The purpose of formulating a social theory is to understand the attitudes and responses of different social groups to particular programmes.

Any simplistic all-India generalisations about the mode of production and the nature of social classes, though essential, are bound to be inadequate. For them to be realistic and purposeful, they have to be based on detailed studies of the specific social structure in the different regions of India.

This paper attempts to analyse the changing nature of caste relations and their significance for class conflict and social change in Maharashtra over the last 150 years.

AN insight into the dynamics of social change is a pre-condition for conducting a revolutionary struggle in any region. The basic framework for such an understanding was laid down by Marx through his materialistic interpretation of history and the theory of class struggle. This basic framework, however, has to be applied to the historical experience of each individual society to arrive at an understanding of its specific laws of social change. In recent years, Marxist theorists have conducted a debate over what is the mode of production and socio-economic formation in our country. But India in its territory and population can be compared to Europe minus the Soviet Union. Each region in this subcontinent has a subnational identity which was shaped by regional, cultural, and political forces over a period of many centuries. A sense of unity amongst the people of a region and a feeling of its distinctiveness from other regions was fostered by pride in the regional language, by the regional literature created by the various religious sects, and by the social rituals peculiar to that particular territory. These regions could not develop into nations in the European sense of the term, owing to the absence of economic change. That economic transformation started in India as a result of British rule. The British, by the nineteenth century, brought India under one political rule for the first time in its history. One common market encompassing the whole of India was established through the suppression of highway robbers, the development of transport and communications, the abolition of all internal trade barriers, and the institution of one common currency. The economic unification of the country prepared the ground for the growth of capitalism in India. However, owing to the different historical and cultural factors, the development of capitalism in the different regions remained extremely uneven. This gave rise to different classes in India which individually, had no homogeneity. Each of these classes comprises different regional and communal groups formed on the basis of caste distinctions, co-operating and competing with each other. Caste has been a basic constituent of our social structure since ancient times and it has continued to influence the attitudes, behaviour, and inter-relations of different groups upto the present. The class structure of each region reflects the influence of caste hierarchy in that region. This fact has to be given due consideration in the discussion by Marxists on socio-economic formations in India.

It should be acknowledged that classes in Marxist theory are not mere economic categories. They are living social groups whose attitudes and responses are determined by historical and cultural factors. The materialistic interpretation of history does not imply an exclusive emphasis on the economic factor to the comparative neglect of others. The purpose of formulating a social theory is to understand the attitudes and responses of different social groups to particular programmes. Any simplistic all-India generalisations about the mode of production and the nature of social classes, though essential, are bound to be inadequate. For them to be realistic and purposeful, they have to be based on detailed studies of the specific social structure in the different regions of India. This paper attempts to analyse the changing nature of caste relations and their significance for class conflict and social change in Maharashtra over the last 150 years.

Cast-Structure or Superstructure

Is caste a part of the class-structure or is it a superstructure? The answer to this question depends on how we define the terms 'class' and the 'superstructure'. It is erroneous to identify caste with class. For example, Morris Ginsberg in the Encyclopaedia of Social Sciences (old series) defines classes in the following manner. "Classes in modern societies may be described as groups of individuals who through common descent, similarity of occupation, wealth and education have come to have a similar stock of ideas, feelings, attitudes and forms of behaviour and who, on any or all these grounds meet one another on equal terms and regard themselves, although with varying degrees of explicitness as belonging to one group".[1] If this definition of class is accepted, all distinction between class and caste will be blurred and there will be as many classes as castes in Indian society. People belonging to one caste have necessarily a common descent as caste is based essentially on birth. The occupation, the pattern of consumption, and even the language and social mores being defined by caste, it is but natural that the people of one caste should have a similar stock of ideas, feelings, attitudes and norms of behaviour. Marxists, however, cannot subscribe to this definition of class. For them, class is defined by its relationship to the means of production. There are basically two classes in any community, those who own the means of production and those who work on them, the exploiters and the exploited. Caste, therefore, will have to be distinguished from class and the relationship between the two independently ascertained.

On the other hand, there are people, who look upon caste merely as a part

— the superstructure which will eventually disappear with a change in the base itself. This view of structure and superstructure is rather unscientific. Superstructure, according to Marx, does not imply a mere apparel or hood which can be tied or untied at will. It is dialectically related to the structure as cause and effect. The economic system and the class structure might determine the nature of social and political institutions and ideologies in any epoch in history; but once these institutions arise and the associated ideas imprint themselves on the masses they become as 'real' as the economic system itself. They have their own independent existence alongside of the economic system, and both act and react upon each other. Secondly, a new economic order does not arise after effacing entirely the vestiges of the old order. The new economic order is born from the womb of the old society and inherits many of its peculiar features. The study of the socio-economic formation in any country, therefore, is the study of these peculiar features associated with the class structure of that society.

Also, there is no empirical evidence to show that the influence of caste is really declining. There is a greater freedom nowadays in food habits and clothing. Education has ceased to be a monopoly of the few and is now widespread, covering all classes. Customary restrictions on freedom of occupation have been removed, and inter-caste marriages though still extremely rare do not provoke the same antipathy and resentment as they did in the past. Nevertheless, it is wrong to assert that caste is no longer an effective force. The chances of a person attaining a higher status and income still depend on his caste. Caste is still a matter for consideration when appointments are made to important posts in the private and the public [illegible] Though love marriages between [illegible] belonging to different castes [illegible] tolerated, a large majority of men and women marry within the confines of their own caste. Because of the growth of democratic politics, caste has emerged as an important instrument in the business of vote collection. Caste consciousness is essentially in-group feeling and, though the [illegible] of expression in rituals, dress, and behaviour as well as the religious sanction supporting it are on the wane, the consciousness of a large majority of our people is still determined by their caste. The basic ingredients of this consciousness and their influence on the outlook of different social groups should, therefore, invite the attention of social scientists.

Social Structure in Maharashtra in Pre-British Period

The origin of caste in ancient India is still shrouded in mystery. The confrontation of different ethnic groups, the clash between patriarchal and matriarchal societies, the hereditary occupation and guild restrictions, the ideas of magic and pollution, and the policies followed by different rulers, must have contributed to the growth of the caste system in this country. Hindu society, which developed over a period of more than 2,000 years, although spread over different regions of India had many common features — such as the supremacy of the Brahmins, the segregation of the lowest castes, hereditary occupation, caste solidarity, and lack of social intercourse among the different castes; yet the specific nature of political power, systems of revenue collection, and ideology of the dominant religious sects in each territory, influenced caste relations.

Maharashtra consists of four different regions; the coastal strip of Konkan, Western Maharashtra, Vidarbha and Marathwada. Among these there is some regional variation. Until the reorganisation of states in the Indian Union, Vidarbha was attached to Madhya Pradesh and Marathwada formed a part of the erstwhile state of Hyderabad under the Nizam. Economically and socially, these two regions have remained backward compared to Western Maharashtra which came under British rule much earlier. Even so, there exists considerable homogeneity in Maharashtra as a whole.

The Marathas are the largest peasant caste of Maharashtra. They form a sizeable majority in every region. Unlike the peasants in Karnataka or Andhra Pradesh, the peasants here are not divided into two or three major castes. Amongst the different regional religious sects in Maharashtra the Varkari sect was the most influential and it continued to be popular till the seventeenth century. The morality and tolerance which this sect preached, the religious equality and brotherhood it fostered and the pride in Marathi language and culture which it generated are supposed to have reduced caste barriers and created something similar to a national consciousness in the Marathi speaking people. In this way it prepared the background for the rise of Maratha power in the seventeenth century. Unlike the Jains or the Lingayats, the Varkari sect never turned into a caste. That explains why, despite religious differences and political conflicts, the unity of the Maratha caste was never endangered. The dominance of one big peasant caste provides the basis for the enduring political stability in Maharashtra in the days of democratic politics.

At the lower end of the social scale, there were three main untouchable castes, of which the Mahars formed the largest single group. It is said that the boundary of Maharashtra is coterminus with the spread of the Mahar caste. The Mahar in the past usually was a balutedar and a petty government servant in the village. Due to the absence of any traditional occupation, the Mahars were ready to go in search of employment wherever it was available. Many of them were recruited in the armies of the Peshwas and later into those of the East India Company. The Company, in its effort to build a modern army, made education compulsory for its recruits and thus opened an avenue for the Mahars to enter the modern age. The superannuated Mahar officers and their children — living in separate settlements and liberated from the shackles of the village economy — were the pioneers of the movement for the emancipation of untouchables in Maharashtra.

One important feature of Maharashtra's caste structure is the absence of an indigenous trading caste of any significance except a small Vani caste in some parts of Konkan. The traders and money-lenders in this region were migrants from the neighbouring territories. In the eighteenth century, with expansion of trade and finance as a result of Maratha conquests, the Maratha rulers invited traders from other areas to come and settle in important towns. To this day, the bourgeosie in Maharashtra belong to the same trading communities that control the economic life of other states of India.

The elites in medieval Maharashtra were mainly from the Maratha, Brahmin, and Kayastha Prabhu castes. The Deshmukhs or the Zamindars in this part of the country were largely from the high-status Maratha families. Under the Adilshahi and Nizamshai kingdoms, many Deshmukhs rose to the

position of court noblemen and commanders. Some of those who distinguished themselves rose to be Jahgirdars and a few such as Shahaji or Jadhavrao could even be king-makers. The Brahmins, in addition to being priests, were appointed as diplomats and administrative officers. The Kayasthas were commanders of forts. Their formal training enabled them to act both as civilian and military officers.

In the reign of Shivaji, a balance of power was maintained amongst the different castes at the court and in the administration. But after Balaji Wishvanath was appointed Peshwa or Prime Minister by Shahu, grandson of Shivaji, this balance of power was disturbed. Within a few years, the Peshwas usurped all political power, and used it for caste aggrandisement. The Peshwas brought young Chitpavan Brahmin boys from Ratnagiri to Poona, offered them educational facilities at State cost and absorbed them in the administration. Brahmins were now appointed army commanders. Jahgirs and inams were bestowed upon them. The revenue on land owned by Brahmins and the customs duties on goods they imported were reduced. Considerable sums of money were distributed among learned and not-so-learned Brahmins as *dakshina* from the State treasury[2] This concentration of religious, political and economic power in the hands of one small caste was bound to arouse the jealously and resentment of other castes. The Maratha army commanders such as the Scindias, Gaikwads, and others, carved out independent States for themselves on the periphery of the Peshwa's kingdom. The Deshastha and Saraswat Brahmins and Kayastha Prabhus migrated to these kingdoms which offered them opportunities for employment and promotion. The suspicion and antagonism bred by this narrow sectarian policy led to conflict between Brahmins and non-Brahmins in Maharashtra.

Caste and Class under British Rule

A modern capitalist sector gradually emerged from the womb of the old economic order under the impact of the British rule. The rate of growth of this sector remained extemely low due to British imperialist domination. Different provinces in India were conquered by the British at different times, and this fact determined the nature of their economic development. Within each province, the opportunities for each individual for entering the modern sector were determined mainly by his caste. The old social order was characterised by the uneven economic and cultural development and unequal life chances for different groups within the community. This inequality continued in the new system. The disarmament of India and suppression of local armies by the new rulers led to the decline of the old ruling classes. The Brahmin diplomats and administrators attached to different local princes lost their means of livelihood when the princes were subjugated by the British. But their long well-established tradition of learning helped the Brahmins to avail themselves of the facilities afforded by new educational institutions set up by the British rulers. Within a few years, they could monopolise the avenues of employment opened out by government departments, educational institutions and commercial establishments. A few of them entered the new professions of lawyers, physicians, and journalists. With the spread of education, many persons of the non-Brahmin castes also obtained the requisite qualifications to enter these occupations. But they could not compete successfully with the Brahmins who were firmly entrenched in these fields for some decades before their entry. Even to this day, most of the posts at higher level of administration in the public and private sectors are held by Brahmins. The Brahmins also continue to dominate the intellectual and cultural life of Maharashtra.

Unlike in Northern India, the British introduced the ryotwari system of land revenue in Maharashtra and recognised the rights of the old cultivating classes in land. But the class relations in agriculture were bound to change under the rule of the new colonial State. With the introduction of private property in land, the growth of the money economy and the development of the means of communications, the beginnings of the process of transfer of land, from the hands of the cultivating classes to the hands of the traders and money-lenders, could be observed by about 1870. It was through this process that the money-lenders slowly turned into landlords. A very large percentage of these absentee landlords and traders came from the marwari trading communities; but the Brahmins were also conspicuous in their ranks. The setting up of the British courts of law, and the principle of 'sanctity of contract' which they were supposed to uphold, helped to inflate considerably the importance of village land records. The suppression of territorial armies had reduced the power of the village headman who was generally one from amongst the Maratha peasants. On the other hand, the Brahmin village accountant, being a keeper for land records and the only literate person in the village community, found himself in a position of power that would enable him to grab the land of the cultivator. When disputes came to be settled in a court of law, the Brahmin lawyer, the Brahmin sub-judge and the Brahmin mamlatdar often ranged themselves on the side of the Brahmin money-lender much to the detriment of the cultivator's interest. Tris concentration of power at the lower rungs of the bureancratic ladder, and its use for ignoble selfish ends, evoked resentment and anguish among the cultivator. If it did not assume the form of collective fury against the Brahmins, it was because the Brahmin's person was protected by religious sanction.

Caste Interests and Ideology of Different Groups

The educated middle class of Brahmins was extremely small in size but was united by caste bonds, economic interests, and a keen nostalgia for lost political power. In the power vacuum created by the decline of the old ruling classes and the weakness of the indigenous bourgeosie struggle for survival under the pressures of foreign competition, the educated middle class gained an importance out of all proportion to its size and economic strength. The social and political life of Maharashtra in the nineteenth century bears the imprint of the aspirations and achievements, the limitations and weaknesses of this Brahmin middle class. The dominating position of this class was undermined only by the rise of the industrial bourgeoisie after the First World War.

English education threw open for the upper caste intellectuals in Maharashtra a window on the outer world. Their study of English constitutional history, classical political economy, the social philosophy of Bentham, Mill and Spencer, and the religious teachings of the rebel Protestant sects, developed in them an awareness of modern social values. They began to examine their society through Western eyes. The achievements of the Europeans in modern science, their

religious tolerance and the freedom of the individual in social and economic affairs, struck them as impressive enough to make them want to emulate them. The development of democratic political institutions and the superior techniques of production and economic organisations in the European countries made a strong appeal to them. Slowly, they came to realise that, unless feudal fetters were broken and new social values assimilated, no social progress was possible. M G Ranade — a judge — was the chief spokesman of this group of liberal social reformers. He defined social reform as "a change from constraint to freedom, from credulity to faith, from status to contract, from authority to reason, from unorganised to organised life, from bigotry to toleration, from blind fatalism to a sense of human dignity". With this end in view, he encouraged the establishment of different associations such as the 'Society for the Propagation of Widow Remarriage', a school for women, the Sarvajan'ka Sabha, the social conference, etc. The programme which the social reformers advocated covered such modest reforms as the prohibition of the tonsure of widows and of child marriage. They demanded that the age of consent for intercourse within or without marriage be increased, that widow remarriage be allowed, and female education encouraged. This programme amounted to a reform of the family system and better treatment of women rather than total social reform as such. But the educated middle class, and the commercial bourgeoisie from which these social reformers arose, could not accept even such limited reforms because their own status and privileges, as Brahmins, were based on the hoary traditions of the past. Abolition of caste inequality could not even be put on the agenda of social reforms. By the end of the nineteenth century, the issue of social reform receded into the background, and the educated classes turned their attention to obtaining more political concessions from the British.

Revivalistic Nationalism

Tilak was the leader of the anti-social-reform group of middle class Brahmins, most of whom had received modern education. He largely succeeded in convincing his followers that social progress was not a practical proposition under the alien rulers and that political reform should get precedence over social reform. He appealed to his followers to concentrate their energies on political propaganda and agitation. The British could be persuaded to give political concessions, Tilak believed, only if the Indians persistently and unitedly pressed for them. He felt that social reform being a domestic matter was bound to antagonise certain social groups and would divide the Indian public opinion which he was so assiduously trying to build up. Moreover, Tilak thought that there was nothing basically wrong with the Indian social system. It did help India to survive the onslaught of alien political rules and cultures, whereas the civilisations of ancient Greece and Rome crumbled under the blows of foreign invasion. The main cause of India's defeat was not its social and cultural backwardness but the lack of technical knowledge and the disunity which helped the British play one local ruler against another. National unity was the need of the hour. Social reform could well wait till India had achieved its political independence.

Tilak was the first political leader in Maharashtra who realised the importance of articulate public opinion as a weapon to pressurise the British in the granting of political concessions. Through his speeches and writings, he continuously roused the people to combat the British. But since he represented a class which was not willing to share its privileges and power with the masses, he tried to mould national unity through evolving national symbols and ceremonies. He initiated the public Ganapati and Shivaji festivals. In the second half of the nineteenth century, Maharashtra had witnessed a renaissance of classical Sanskrit learning.

After the establishment of the University of Bombay in 1857, Indian students were introduced for the first time to the researches made by Western scholars in Eastern philosophy, Sanskrit literature, and ancient Indian history. A large number of Sanskrit works on different subjects were translated into Marathi. Native scholars embarked upon their independent studies of medieval Marathi literature and history. The eulogies showered on ancient Indian learning by Western philosophers ad Indologists helped to remove the inferiority complex created among the first generation of educated Indians by the initial influence of Western civilisation. This was now replaced by an excessive pride in India's heritage and civilisation, a development that was extremely congenial to the mental make-up of the educated middle-class Brahmins who were longing for a return to past privileges and power. Tilak based his nationalism on a deep respect for the universalistic Hindu Philosophy, the cultural heritage of ancient Aryans, the regional identity of Marathi-speaking people, and their sense of pride in the military exploits of the Maratha armies under the Peshwas. Despite the indomitable courage and idealism of Tilak and the self-sacrifice he willingly made for the national cause, this sentimental nationalism did not muster many adherents to the extremist party from the non-Brahmin masses of Maharashtra. The party remained essentially confined to middle-class Brahmins. The revivalistic nationalism of Tilak has continued to be the mainstay of the ideology of the Brahmin middle class of Maharashtra to the present day.

Phule and the Satyashodhak Movement

The last quarter of the nineteenth century witnessed the emergence of an educated middle class and a petty bourgeoisie from the the ranks of the non-Brahmin castes in Maharashtra. Through English education, they also learnt the liberal social values and, having imbibed them, they proceeded to challenge the old social order. Many of the non-Brahmin intellectuals who came forward in this period were educated in the English schools opened by the Protestant missionaries of the Free Church Society. Unlike the Jesuits and other Catholic missionaries who had come to India with the Portuguese and who compromised with the medieval caste system, the Protestant missionaries commenced their effort at conversion with an attack on Hindu religion and the traditional social order. The special targets of their attack were the customs of sati and infanticide, the cruel treatment meted out to upper caste widows, the ideas of religious pollution, and untouchability. The Puritans had revolted against the religious bigotry and the church hierarchy in their own country. Their insistence on the right of each individual to have direct communion with the Almighty was a typical feature of that sect. It is no wonder, therefore, that the Indians who were deeply impressed by such a philosophy should express serious objections to the caste hierarchy and to Brahmin privileges.

Note the changes 14 years of Food Corporation have made in the life of the Nation...

and in yours.

Our Nation—over a decade ago

A systematic foodgrain procurement and distribution system was yet to be born. Threats of shortages always loomed large. FCI entered the scene in 1965. In a small way. In four states. Procured 11 lakh tonnes of foodgrains.

14 years later—reaching foodgrains to the millions

The country has the largest public foodgrain distribution system in the world. The FCI now covers every state, every union territory. Procures over 100 lakh tonnes in a year. Moves foodgrains over a 12 lakh kms. road-and-rail transport network. Offers indirect employment to lakhs of people. Holds a stock of over 130 lakh tonnes valued at approximately 1,800 crores of rupees. And, ensures that foodgrains reach the vast majority of India's millions.

Fertilisers for the farm sector—before FCI

Imports had to keep pace with increasing demand. For its proper channelling, a streamlined handling machinery was needed.

And today, ushering in a new era

The FCI handles 75% of imported non-pottasic fertilisers—about 30 lakh tonnes. Handles them at ports, stores them, distributes them. And so ensures that they reach the farmer at the right time, at the right price.

The farmer—14 years ago

He had his produce. Rarely, the right price. Lived in constant fear of distress sales and exploitation by middle-men.

The farmer today—reaping the fruits of his labour

He has his produce. And, always, the support price. So, the poorest of them gets the price the richest of them can expect. No more fear of exploitation, of distress sales. Instead, better prices to serve as incentives to grow more.

The common man then—at the mercy of men and nature

Exposed to foodgrain shortages. Uncertain of where his next supply of foodgrains would come from. At the mercy of price fluctuations.

The common man today—assured of his needs

Assured a steady foodgrain supply. At fixed prices that are lower than the actual costs—thanks to a Government Subsidy that absorbs a part of the overhead costs. FCI's supplies reach him through almost 2½ lakh retail 'fair-price' shops. And ensures that foodgrains reach every man, woman and child at any given time.

FOOD CORPORATION OF INDIA

14 years in the service of the nation

Phule opened a frontal attack on the caste system. He asserted that the Vedas, Puranas, and other religious books of the Hindus, did not represent divine relations but were simply products of upper-caste intellectuals interested in upholding their caste privileges and in the exploitation of the common people. He tried to show, however crudely, that the history of India is a history of the Brahmin upper castes trying to dominate by means fair and foul the common people, the shudras, and the ati-shudras — i e, the untouchables. The shudras, he said, for the first time in Indian history now had an opportunity to overthrow the hated yoke of Brahmin domination. Divine dispensation had, as it were, bestowed on them the rulers who were sympathetic to their cause. They should now liberate themselves from the age-old traditions and superstitions and unitedly fight for their religious and social rights.

With this end in view, in 1873, he established the Satyashodhak Samaj and raised the banner of revolt. The Satyashodhak Samaj encouraged the non-Brahmin castes to perform different religious rituals without the intervention of Brahmin priests. His supporters were mainly the urban non-Brahmin traders and contractors of which Telugu Malis formed a significant proportion. Phule sympathised with the misery of the agriculturists and urged the British government to ameliorate their lot through the introduction of compulsory primary education, provision of credit, and other facilities. Lokhande, the editor of *Deenbandhu* and the father of the Indian trade union movement, was a leader of the Satyashodhak movement in Bombay. However, in Phule's time the Satyashodhak movement was confined to a few urban centres and had little impact on the non-Brahmin peasantry in Maharashtra.

A new chapter opened in the history of the non-Brahmin movement in the first decade of the twentieth century when Shahu Chhatrapati, the ruler of Kolhapur and a descendent of Shivaji, became its acknowledged leader. Shahu's interest in social reform originated in a personal experience of the time when the Brahmin priest in the royal household had refused to perform the religious rituals according to Vedic rites on the ground that the ruler was not a Kshatriya. A heated dispute ensued between the Maratha landed gentry claiming Kshatriya status and the Brahmins who opposed them on the ground that after the annihilation of Kshatriyas by Lord Parshuram no Kshatriyas were left in Maharashtra. The 'extremist' nationalists sided with the conservative Brahmins and fanned the flames of caste antagonism.

Shahu was sympathetic to the aspirations of the untouchables and worked in his own way for the eradication of untouchability and the advancement of the scheduled castes. However, the main thrust of his effort was to encourage the formation of a modern elite from among the non-Brahmin peasant castes. He assisted students to get higher education, encouraged the educated people to settle in the higher professions, supported non-Brahmin journalists and encouraged promising candidates to participate in the politics of the then Bombay Presidency. Though sympathetic to social reform, he was personally more inclined towards the Arya Samaj, which believed in the sanctity of the Vedas and in the continuity of tradition, than towards the heretical teachings of the Satyashodhak Samaj. The non-Brahmin elite under Shahu defied the supermacy of the Brahmins in the religious and social fields.

However, both when Phule and Shahu Chhatrapati were prominent on the political scene the non-Brahmin leaders remained loyal to the British government. They contended that only the Brahmins stood to benefit from political rights and political reforms. The acquisition of power by the Brahmin politicians would help perpetuate caste domination. The non-Brahmins, they said, should concentrate their energies on social reform where the foreign rulers would assist them. These conflicting attitudes to the problems of social and political reform reflect the caste and class interests of the Brahmin and non-Brahmin elite in this period.

Non-Brahmins in Politics

The First World War helped to rouse political awareness among the wider strata of the Indian population. The British government had declared the progressive realisation of responsible government, as the aim of their policy in India. The growth of democratic institutions create new aspirations in the non-Brahmin elite that could envisage its majority in any elected legislative body. A non-Brahmin political party was formed. Satyashodhak propagandists went from village to village arousing the peasants to resist actively the Brahmin domination. Despite the Congress call for non-co-operation with the British Raj, the non-Brahmin party contested the elections to the provincial legislative assemblies and a few of its leaders even held ministerial posts under diarchy. With political power in sight, however, the enthusiasm for social reforms diminished. Phule's dream of a united revolutionary movement of the Shudras and the untouchables proved to be ephemeral and the non-Brahmin party gradually disassociated itself from the movement for emancipation of the nutouchables which was taking shape under the leadership of Ambedkar.

With the emergence of Gandhi as a national leader, all-India politics was taking a new turn. Gandhi tried to form a united front of different classes and castes under the leadership of the bourgeoisie against the British imperialist power. His satyagraha proved to be more efficient technique for mobilising public opinion and for pressurising the British. His constant reference to the welfare of the downtrodden as the only justification for the demand for Swaraj endeared him to millions of his countrymen. He openly opposed caste inequality and untouchability. Upholding the dignity of labour, he induced scores of his devoted followers to work in the villages for constructive programmes. The new generation of non-Brahmin elites, therefore, realised that their long-term interests lay in joining the Indian National Congress and, under the leadership of Keshavrao Jedhe, they took the plunge in 1930 by responding to the call of civil disobedience.

Brahmins and the Hindu Mahasabha

Gandhi's non-co-operation movement, however, was anathema to a large section of the Brahmin educated middle class of Maharashtra. The boycott of legislatures, government posts, educational institutions and courts of law could deprive them of their means of livelihood. They ridiculed Gandhi's ideas as irrational and impracticable. The growth of democratic politics was disturbing to them as it would lead to their subordination to the non-Brahmin majority. Gandhi's advocacy of social reform was too bitter a pill to swallow and so, at the time the non-Brahmins joined the Indian National Congress, the Brahmin educated classes in Maharashtra left it to join the Hindu Mahasabha. The rise of Fascist parties in Europe in the 1930s was a beacon light which

they were only too eager to follow, and the Rashtriya Swayamsevak Sangh was formed with the brown shirt as uniform. After his release from detention, Savarkar became leader of the Hindu Mahasabha and he pursued with vigour the policy of opposing the Congress, on the ground that it was pro-Muslim. The gulf between the non-Brahmin majority in the Congress and the Brahmin-dominated Hindu Mahasabha kept widening, producing great bitterness. When Gandhi was assassinated in 1948 by a Brahmin, this bitterness erupted into anti-Brahmin riots. To this day, the Brahmin middle class and petty-bourgeoisie have retained their fidelity to the Hindu communal forces in Maharashtra.

Not all Brahmins, of course, supported the communal parties A sizeable minority with a liberal background continued their association with the Indian National Congress, and provided Gandhi with constructive workers devoted to work in the villages. They won for Congress the spontaneous support of the poor. The success of the Russian revolution fascinated the intellectuals in the undeveloped colonial countries and introduced socialist ideas. The Communist and the Congress Socialist parties came into existence. The leadership of these Leftist parties was drawn mainly from the upper-caste intellectuals and the party's following was drawn from the industrial proletariat. After Independence, the intellectuals of the non-Brahmin castes also established a socialist party — namely, the Peasants and Workers party But when the Indian National Congress accepted socialism as its credo, there was little to distinguish the other democratic parties from the Congress. The Leftist political parties have been functioning only in a few big towns and cities, with hardly any foothold in the rural areas. The Congress, since Independence, has been essentially in Maharashtra, a party of Maratha peasants, united by strong caste bonds. Under the leadership of Y B Chavan, it remained more or less liberal in outlook. It accommodated promising young men from other non-Brahmin castes who could show some caste following. No opposition party was able to make any inroads into this Congress stronghold till the general election of 1977.

After the establishment of adult franchise, the Brahmins who formed an insignificant minority in the whole population were thrown out of the political field. The decline of Brahmin power has reduced the severity of the Brahmin *versus* non-Brahmin conflict. The implementation of land reform drove out from the village the absentee landlord, many of whom were Brahmins. Owing to the growth of industry and the Indianisation of bureaucracy, many opportunities were opened for technicians and administrators most of which were seized by the Brahmins who invariably possessed the requisite technical qualifications Some have even started their own business firms and have become entrepreneurs All Brahmins, however, do not belong to the bourgeoisie. A large proportion of them belong to the lower middle classes, working as clerks or primary and secondary teachers

Caste influences are still very deep-rooted, and educated Brahmins suffer from the complex that job reservation for the scheduled castes and the political leverage of the Marathas keep them away from those posts which they deserve to occupy on the basis of their qualifications This feeling comes to the surface in times of crisis, such as the recent Marathwada riots. However, the Brahmins are not much of a political force today The Jan Sangh could not win in Maharashtra any parliamentary seat in the general elections The Hindu communal forces, however, have secured a new lease of life after the victory of the Janata party in the elections of 1977 and 1978 Yet, the fact that the Janata party could form a ministry in Maharashtra only after the defection of Sharad Pawar bears testimony to its own feeble rural support

Scheduled Castes and the Struggle for Independence

After Independence, the main battle lines have been drawn between the caste Hindus on the one hand and the scheduled caste Mahars or Buddhists on the other. Unlike the Marathas, there was no landed gentry nor any tradition of political power for the scheduled castes. They belong to the lowest strata of the rural population, being poor farmers and agricultural labourers. But the ryotwari system has saved them for the abject servility from which their brethren suffered in the North, In medieval times, the Mahars were recruited to the Maratha armies and that tradition continued under the East India Company and the Crown. The modern army gave the Mahars the opportunity to enter the modern age When Lord Kitchner became the Commander-in-Chief of the Indian army in the last decade of the nineteenth century, he discontinued the Mahar recruitment on the plea that the Mahars did not belong to the martial races of India The Mahars reacted by sending a memorandum to the government requesting it to reconsider its view. Thus began a political movement which served as a precursor to the movement for the emancipation of the untouchables, which took a keen edge after the First World War.

The scheduled caste struggle for their religious and social rights started in 1923, when Ambedkar returned after completing his higher studies in England and the US and established the Bahishkrita Hitakarini Sabha. In the first phases of the movement, the programme consisted of assertion of the rights to public places and entry into Hindu temples. A satyagraha was organised in 1927 for drawing water from a public tank at Mahad in Kolaba District, followed by satyagrahas for entry into temples in Pune and Nasik The invitation given by the British government to Ambedkar and Rao Bahadur Raja to participate in the Round Table Conference in 1930 as representatives of the scheduled castes served to promote in them a consciousness of their political power and to bring the issue of scheduled castes to prominence in the political field

Unlike non-Brahmin leaders who gave precedence to social reform over political reform, the scheduled castes now decided to discontinue their movement for religious and social equality and concentrate on the demand for political rights The consideration which weighed with them was that a struggle for social and religious rights was bound to rouse the indignation of the caste Hindus and provoke them to hostile action The scheduled caste people were too small in numbers and too weak and unorganised to withstand such an offensive Secondly, the strategy that the caste Hindus adopted in the face of scheduled caste satyagraha was the obtaining of a stay order from the Court on the ground that the said places were private property and that the scheduled castes did not even have the customary right to their use The untouchables in such cases could achieve their end by resorting to civil disobedience which would create a law and order problem and antagonise the British authorities. The scheduled caste leaders. therefore, turned their

attention to the political field. However, they refused to make common cause with the Indian National Congress Instead, they relied on the British Government to provide them the safeguards which they thought essential for protecting their interests from caste Hindu majority in the emerging political set-up.

At the Round Table Conference, Ambedkar made a demand for separate electorates for the untouchables. The 'Communal Award', which followed, provoked Gandhi to declare a fast unto death and a compromise was reached on the basis of reserved seats and joint electorates. This failed to satisfy the scheduled caste leaders, and they continued to press for additional safeguards. The constant pressure from the scheduled castes worked as a counterweight to the conservative and revivalist forces in the Congress and helped the Congress leaders to take a secular and democratic stand. However, the reliance of the scheduled castes on the British government and their opposition to the Indian National Congress opened a gulf between them and the anti-imperialist progressive forces, which is difficult to bridge even 30 years after Independence. The Mahar leaders indicted the Congress for being indifferent to the distressing conditions of the scheduled castes and advised their followers to beware of Gandhi The Congress, in its turn, supported the Chamars to capture the reserved seats and caused an estrangement between the two scheduled caste communities

Buddhism vs Marxism

Ambedkar was educated in British and American universities in the heyday of Liberalism. Freedom of speech and expression, of faith and religion, equality before law, and democracy, remained the basis of his social philosophy to the end of his life. Historically, Liberalism has evolved as the philosophy of the rising bourgeoisie. It cannot be a tool for the most downtrodden sections of society in their struggle against exploitation The invisible hand of perfect competition cannot maximise the welfare of agricultural and industrial labourers, who need not the formal equality before law but the actual equality of opportunity. Socialism is the natural creed for the exploited classes of the community, and Ambedkar slowly veered to some form of democratic socialism in the last years of his life In his book "States and Minorities" published in 1947, he advocated nationalisation of land and of basic industries as solutions to the problem of economic inequality. He also maintained that nationalisation of land and basic industries should be made an integral part of the democratic constitution.[3]

However, despite his secular outlook, he could not sever all his moorings in religion. In his search for an alternative to Hinduism based on inequality by birth and untouchability, he turned to Buddhism as an ideal religion. He embraced Buddhism in 1956, and encouraged thousands of his followers to do the same. His interpretation of Buddhist religious texts in his book "Buddh and his Dhamma" is on the lines of his liberal philosophy. Yet, it is no substitute for a radical ideology.

Ambedkar was a staunch believer in democratic values and practices. Yet he feared that, in the Indian society characterised by discrimination based on caste, democracy would in actual practice turn out to be domination of the scheduled castes by the caste Hindu majority. Socialism is nothing but the extension of the democratic principle to the social and economic fields. It is defined as a government by the workers and the peasants. But, unless caste distinctions disappear, a government of the workers would also mean a rule of caste Hindu workers. The scheduled castes might not be allowed to participate in it. This view was strengthened by the indifference shown by Indian Marxists to the eradication of the evils of the caste system. It was further supported by the actual experience of the trade unions which not only tolerated but often insisted on discrimination in employment and division of work in the factories on the basis of untouchability. Similarly Marxism, to Ambedkar, it appeared, was inconsistent with the tenets of democracy. It was based on violence. Ambedkar's writings do not display any close familiarity with Marxist classics. Nevertheless, after his conversion to Buddhism, he proclaimed that Buddhism was Marxism purged of violence.[4] Such juxtaposition of Buddhism and Marxism has produced a lot of confusion among Buddhist intellectual circles. And vested interests find in it a handy tool to check the spread of Marxist thinking among the Buddhists. The conversion to Buddhism has assisted the Mahars to liberate themselves mentally from the shackles of the old hated religion. It has, however, placed a wedge between the Buddhists and the other scheduled castes in Maharashtra.

Caste or Class Organisation?

The practical problem having a bearing on ideology continues to be of the kind of organisation that is more suited to the struggle of the scheduled castes against their oppression. Economically the poorest, educationally backward, and with a strong feeling of social inferiority generated by the ideas of *karma* and rebirth, the scheduled castes are rather too weak and unorganised to have direct confrontation with the caste Hindu majority on their own. They need support from the other progressive forces. The only possible support to them can be drawn from other exploited classes in the community and the Leftist parties representing their cause. Ambedkar was aware of this. But, in the peculiar political situation in India in the two decades before Independence, he could not decide between building up a caste-based and a class-based party. The British government in its efforts to halt the advance of the nationalist forces claimed to be the champion of the minorities in their struggle for safeguards in the future constitution of India. A caste-based party was, therefore, under Indian conditions not only easy to organise but also likely to carry some weight with the government. On the other hand, in domestic politics based on elected legislatures and responsible governments, a party of a small minority like the scheduled castes would be swept off in the polls and so fail to produce any impact on the government of the country.

Ambedkar thus adjusted his tactics to the situation. At the Round Table Conference and the negotiations over the Poona pact he acted as a spokesman for the scheduled castes. Within a few years, when elections were declared to the provincial legislative assemblies in 1937, Ambedkar took the help of a few Leftist intellectuals and formed a broadbased Independent Labour Party with a socialist platform. Despite the Congress opposition the party could secure 18 seats in the Bombay legislative assembly. But the Congress ministries resigned in 1939, and all power was again vested in the hands of the governor. During the period of the Second World War, Ambedkar was invited by the governor general to be a member of his executive council; the Independent Labour Party met a natural demise When again negotiations started between the Congress and the British government over the transfer of power, Ambedkar established

the Scheduled Caste Federation and demanded safeguards for their protection. The Federation even organised satyagraha in some important towns to attract attention to their demands.

In the first general elections in the Republic of India held in 1952 the Scheduled Caste Federation fared badly, failing even to secure the reserved seats, and Ambedkar himself who contested the reserved seat form the double-member constituency of Central Bombay suffered a crushing defeat. A few days before his death in 1956, he advised his followers to dissolve the Scheduled Caste Federation and establish the Republican Party of India on liberal democratic lines. But in the absence of a towering personality like Ambedkar, the party failed to attract members from other castes and remained confined to the Buddhist followers of Ambedkar. The fear of submersion by a caste-Hindu majority in a class-based party still haunts the different radical political groups among the Buddhists and acts as a barrier to their entry. At the same time, the inherent weakness of their position leads the Dalit Panthers to assume pseudo-radical postures and make symbolic demands which provoke rather than attract the sympathetic or neutral elements from even the poorest strata of the caste Hindu population.

Caste and Class after Independence

With increasing commercialisation, a differentiation in peasantry slowly came about in Indian agriculture. A class of Kulaks has arisen in the irrigated sugarcane and cotton areas of the state. Though the Green Revolution could not spread owing to lack of irrigation facilities, capitalist values have made inroads in the rural areas. The economic and political power of the rural rich has increased in the 30 years after Independence. After the Rural Credit Survey of 1954, the Reserve Bank of India injected vast funds in the co-operative movement, Maharashtra, having a more developed co-operative credit structure than other states, was in a position to benefit from this policy. These funds have gone into the hands of the rich farmers who dominate the co-operative societies. With assistance from the state government the co-operative sugar factories have proliferated in Western Maharashtra. The Panchayati Raj institutions established after 1960 offered the dominant classes in the rural areas an opportunity to control the administrative apparatus too. They also dominate the educational institutions whose number rapidly increased with the increase in the popular demand for education. This increasing concentration of power in the hands of the rural rich belonging to the major peasant castes is an important feature of rural life in Maharashtra, today.

The other side of the picture is the increasing consciousness about civil and political rights amongst the scheduled castes particularly the Buddhists. The long tradition of political movement and the social consciousness it created have helped the Mahars to avail themselves of the concessions offered by the government in the educational field. The educated scheduled caste men are now competing with the caste Hindus for administrative posts and other jobs in industry. This increasing competition from the scheduled castes combined with large-scale unemployment is the main cause of the widespread social tensions in the underdeveloped regions of Maharashtra such as Marathwada.

With the growth of education in the towns, new ideas and moral values spread gradually to the rural areas. The social life of an Indian village is still centered round the village temple. The conversion to Buddhism induced the Mahars to sever the bond which bound them to the feudal order. They have given up the flaying of dead cattle and other such degrading tasks allotted to them by the traditional division of labour in the village economy. They now depend for their earning mostly on wage-labour. The emancipation of the Mahars from the feudal yoke, their rejection of Hindu religion, their desire to improve their economic lot, and the resistance which they show to social oppression, have enraged the dominant caste and class groups and has exacerbated the class conflict in the village.

Caste Conflict and Marxist Parties

The caste background of different social groups has created many problems for the Marxist political parties. A large number of Marxist party leaders are recruited from middle class Brahmin families as the Brahmins were in the forefront of the political struggle. But a Brahmin, though a Marxist intellectual, finds it more difficult to overcome the caste barriers than those of class. Marx expected Socialists to be declassed and every middle class intellectual is made aware of his class bias from the time he joins the Communist party. But there is no mention of caste in the classical Marxist textbooks as they were written against the background of Western historical experience. Caste is not, however, a group which one can join by acquiring income or wealth. It is hereditary and right from birth a Hindu inherits a whole cultural tradition. A person's physique, his likes and dislikes in food, his language, the manner of speech, and his whole bearing, show the impress of his caste heritage. Except for those who are completely Westernised and thus alienated from Indian society, no individual can efface the influence of his caste upbringing. Amongst the Brahmin Marxists, caste influence might take various forms. On the intellectual plane it is expressed in a greater affinity towards Tilak's revivalist nationalism than towards Gandhi's liberal humanism. The revivalists argued that political reform should get priority over social reforms and all problems created by religious orthodoxy and social inequality could be postponed till political independence. The implicit belief of the Marxist, that a proletarian revolution would solve the problem of untouchability and caste inequality, is equally unrelated to the realities of the Indian situation. All Marxist theory and practice, even though avowedly revolutionary, is strictly confined to the economic sphere. The social, religious and even the cultural aspects of social life are generally ignored. Communism is not looked upon as an all-round movement for the fundamental reconstruction of the whole social order on the basis of new moral values but is taken to mean only a reformation of the economic system and the relations of production. This total indifference towards the problems created by social inequality is one reason why Communists have failed to attract the lower castes towards them.

A typical upper-caste intellectual or trade union leader is unable to overcome easily the overbearing superiority and exclusiveness, veiled though it is, fostered by his caste background. Its outward form is intellectual snobbishness and the inability to move with others on a footing of equality. The mode of his behaviour and intellectual powers being far different from the labourers, he cannot act as one amongst equals. The wide gap between leaders and followers impedes the evolution of leadership from below.

On the level of the individual village, caste and class many a time completely coincide. The upper class of traders, moneylenders or kulaks generally belong to some higher or middle level caste cluster and the landless labourers are either untouchables or tribals. Marxist movements in the rural areas of Maharashtra have been confined to the tribal pockets. As the landlords belong to a different caste than the labourers, tribal loyalty, cohesion, and organisation can be used to wage a class struggle. This is amply illustrated by the Warli revolt in the Thana district under the guidance of CPM leader Godavari Parulekar. But the consciousness of the labourers remains essentially tribal and comes in the way of spreading the movement to other areas. For the same reason, the organisations of the agricultural labourers cannot be co-ordinated with other organisations of the proletariat at the state level. The tribals who have not yet lost their independence of spirit and who have not imbibed the Hindu philosophy of fatalism can perhaps be more roused to revolt than the depressed classes in Hindu society. But they cannot form the vanguard of revolution. For, they are too backward culturally and too much isolated from others to give effective leadership to other classes.

The Brahmins generally belong to the bourgeoisie and the scheduled castes on the whole to the most exploited sections of society. It is, however, the caste loyalties of social groups which have arisen from the middle-level peasant castes that create real obstacles to the growth of revolutionary consciousness. Marx characterised the industrial proletariat as the vanguard of the revolution, since, according to him, it had nothing to lose but chains and a world to win. This characterisation is wholly true of no class in the Indian Society. Each caste, however low it might be in the caste hierarchy has [illegible] group which it believes to be [illegible] than itself in rank and prestige [illegible] therefore, unwilling to give up its [illegible] to superiority on that count. [illegible] industrial labourer joins his fellow [illegible] belonging to diverse communal [illegible] the factory in fighting for [illegible] and bonus against his [illegible]ers. Yet, he does not wish to [illegible]d the privileges of caste. The [illegible] who insists on the workers [illegible] the old practices is afraid of being unpopular and of rousing the antagonism of the majority. So, even in factories with Leftist trade unions, caste injustices continue. And let the city worker go back to his village for rest or worship of family idols, he will use all his energies to fight against his caste enemies and to show the untouchable 'his proper place'. His caste loyalty can be easily roused at the time of elections and he would vote for his caste fellow irrespective of the political party. The narrow economism of the trade unions has deep roots in the caste affinity of the worker.

The peasants in any country are by nature averse to social change. But in the caste of India their conservatism is further strengthened by their feeling of caste loyalty to the Kulak. The institutions which have naturally sprung up or been deliberately fostered by the States in rural India, such as the Panchayati Raj political institutions, the co-operative organisations, and the educational bodies, have helped the kulaks to mobilise the caste loyalties of the middle and small peasants. It is, therefore, becoming extremely difficult to mobilise them on a class basis. The willing co-operation given by the small peasants, the natural allies of the landless agricultural labourers to the dominant class groups in the atrocities against Buddhists is the most disturbing feature of the recent riots in Marathwada.

Caste is too restrictive a social group and caste feeling is closely associated with mixed feelings of superiority and inferiority. As such, it should have no place in future Indian society. Yet it has been exploited in a most opportunistic manner by all political parties in their competition for votes in the context of parliamentary democracy. Marxist realism is essentially different from this opportunism. It bases itself on the knowledge of the real factors in the existing situation, making at the same time an attempt to dialectically overcome them. Theoretically, this implies that the Marxists should give up their narrow economism and work on all fronts for a basic transformation of Indian society. The problems created by religious bigotry, sway of tradition, and social inequality, were tackled in Western Europe in the renaissance, the reformation, and the social struggles associated with the industrial revolution. Indian society is yet to take such a leap. In India, social inequality is extremely deep-rooted, much more so than the economic inequality and unless a party devotes its energies and exerts simultaneously for a social and cultural revolution, its success on the political and economic front would help only a few upper caste groups amongst the peasants and workers, leaving out the more depressed other social groups. This fear itself has kept the depressed classes away from the Marxist parties.

In the words of Ambedkar, "Men will not join in a revolution for the equalisation of property unless they know that after the revolution is achieved they will be treated equally and that there will be no discrimination of caste and creed. The assurance of a socialist leading the revolution that he does not believe in caste, I am sure, will not suffice. The assurance must be the assurance proceeding from much deeper foundation, namely the mental attitude of the compatriots towards one another in their spirit of personal equality and fraternity. That the social order prevalent in India is a matter which a socialist must deal with, that unless he does so, he cannot achieve his revolution and that if he does achieve it as a result of good fortune, he will have to grapple with it, if he wishes to realise his ideal, is a proposition which in my opinion is incontrovertible."[5] Marxists can ignore this warning only at their own peril.

Glass-Lined Equipment

GLASS - LINED EQUIPMENT has shown better results for the year ended June 1978. Sales have increased from Rs 35 lakhs to Rs 55 lakhs and gross-profit is up from Rs 8 lakhs to Rs 9 lakhs, reflecting contraction of margins. After making provision for depreciation and investment allowance, net profit is lower at Rs 4 lakhs (Rs 5 lakhs). This has been utilised to wipe off the loss of Rs 1,70,260 brought forward from the previous year and to write off preliminary expenses to the extent of Rs 66,976 and provide Rs 1.50 lakhs for preference share redemption reserve. This year's target of sales is Rs 75 lakhs.

Representation

A Preliminary Assessment of India's Thirty-Year Experience with Reserved Seats in Legislatures

Marc Galanter

Although Indian Intellectuals, including some eminent social scientists, have passed severe judgments on compensatory discrimination policies, it is only in the last few years that systematic research on their effects has been undertaken. And unfortunately very little of it has touched on the subject of reserved seats in legislatures.

For purposes of deciding whether reserved seats should be extended or terminated, the collection and analysis of data about their performance is only a first (though essential) step. The policy decision involves at least three major sorts of questions beyond the estimation of costs and benefits up-till now.

First, once a pattern of costs and benefits is ascertained, there is the question of whether it can be expected to continue in the future.

Second, since the goals and dangers of the compensatory discrimination policy are multiple, an evaluation of costs and benefits requires that some kind of weights and priorities be assigned to these goals or dangers. These can be supplied only by a vision of a future society that unites the desirable with the possible.

Third, evaluation must be comparative. Acceptance or rejection of the package of benefits and costs believed to be associated with reserved seats must be compared with the costs as well as the benefits anticipated to arise from any alternative that is believed to be preferable.

THE Indian effort to secure equality by means of preferential treatment or compensatory discrimination is unique in scope and extent. As Lelah Dushkin observes, "nowhere else is so large an underprivileged minority granted so much special treatment . . ."[1] Preferences are of three basic types: first, reservations, which provide easier access to valued positions within important social institutions. The most important preferences of this type are reserved seats in legislatures, reservation of posts in government service, and reservation of places in academic institutions (especially coveted higher technical and professional colleges). To a lesser extent, the reservation device is also used in the distribution of land allotments, housing and other scarce resources. Second, there are expenditures of government resources in behalf of the beneficiaries — i e, scholarships, grants, loans, land allotments and provision of other special facilities such as legal aid. Third, there are special protections, such as measures designed to protect "untouchables" from discriminatory treatment and exemption from liability to having one's land subject to execution

The benefits of "compensatory discrimination" are extended to three major classes of beneficiaries.[2] First, there are those castes designated as Scheduled Castes on the basis of their historic connection with "untouchability". They numbered nearly 80 million (14.6 per cent of the population) according to the 1971 Census. Second, there are the Scheduled Tribes who are distinguished by their tribal culture and physical isolation and many of whom are residents of specially-protected Scheduled Areas. They numbered more than 38 million (6.9 per cent of the population) in 1971. Third, there are the "Backward Classes" (or, as they are sometimes called, "Other Backward Classes"), a heterogeneous category, varying greatly from state to state, comprised for the most part of castes (and some non-Hindu communities) low in the traditional social hierarchy, but not so low as the Scheduled Castes.[3]

For the most part, these preferences have been distributed on a communal basis. Members of specified communities are the beneficiaries of a given scheme and all members of the community, however prosperous, are entitled to the benefits. However, some schemes use a means test to supplement the communal one — only members of the listed communities with incomes below the specified ceiling are eligible. In a few instances, the communal test has been replaced by an economic one — income or occupation or a combination of the two — and a few schemes use tests neither communal nor economic.

I

Legislative Reservations

The Constitution specifically provides reserved seats for the Scheduled Castes and the Scheduled Tribes in the Lok Sabha (lower house of Parliament)[4] and the Vidhan Sabhas (lower houses of the state legislatures).[5] No seats are reserved in the upper houses, central or state. There are no reservations in legislatures for the Other Backward Classes or for any minority groups.[6]

All of the other Constitutional provisions for preferences are merely authorisations empowering the state to make special provision for disadvantaged groups. But legislative reservations are specifically provided in the Constitution itself.[7] Seats are reserved in proportion to the population of Scheduled Castes and Scheduled Tribes to the total population of each state. Thus in 1976, 78 (14.4 per cent) of the 542 seats in the Lok Sabha were reserved for Scheduled Castes and 38 seats (7 per cent) for Scheduled Tribes. Of the 3,997 seats in the Vidhan Sabhas, 540 (13.5 per cent) were reserved for Scheduled Castes and 282 (7 per cent) for Scheduled Tribes.[8]

These reservations do not involve "separate electorates", i e, the representation of a particular group by legislators chosen by an electorate composed solely of members of that group.[9] The

...are "reserved" in the sense that ...ates who stand for them must ... to the specified groups, but the ... electorate participates in choosing among candidates so qualified. Separate electorates for Parliament and the State legislatures are specifically out...ed by Article 325, which provides ... person shall be excluded from ...oral roll on grounds of religion, ... or caste.[10]

The Constitutional provision of reserved seats is complemented by statutory provision to enhance political participation by Scheduled Castes and Tribes Smaller election deposits are required from members of these groups and candidates for reserved seats enjoy more permissive residence requirements [11]

Unlike the general authorisation of special treatment and the provision for reserved posts in government service, the reserved seats in legislatures are subject to a constitutional time limit It was originally provided that such reservations should expire ten years after the commencement of the Constitution.[12] In 1959 these provisions were extended for another ten years,[13] and in 1969 for yet another ten [14]

Ten years ago, during the debate on the last extension, M R Masani regretted the absence of "a scientific study of the effects of [reservations] for the past twenty years. . ."[15] As it becomes thirty years there is still no comprehensive study of these effects This article attempts to assemble some of the information that is available, to identify the problems of drawing conclusions from that information, and to formulate a tentative assessment of the working of the reserved seats.

RESERVED CONSTITUENCIES

During the 1950s, most of the reserved seats were in double-member constituencies, in which one of the seats could be filled only by a member of the "privileged" group and the other was open to general competition.[16] Double-member constituencies were abolished in 1961.[17] This abolition seems to have been inspired principally by the concern of politicians with the greater difficulty and expense of campaigning in a double-sized district [18] This was compounded by some resentment of the infrequent but well publicised instances in which the unreserved "general" seat as well as the reserved seat was won by Scheduled Caste or Scheduled Tribe candidates,[19] who were able to compete for both seats while their opponents could compete only for the unreserved seat [20] New single-member constituencies were designated for the 1962 elections [21]

The demarcation of constituencies and designation of those reserved for Scheduled Castes and Tribes are entrusted to a Delimitation Commission, which consists of a retired Supreme Court Judge, a sitting High Court Judge and the Chief Election Commissioner.[22] In each state, the Commission is assisted by ten non-voting associate members (5 Members of Parliament and 5 Members of the Legislative Assembly) nominated by their respective Speakers [23] The Courts are constitutionally barred from intervening in the process of delimitation or allotment of seats.[24]

Generally, constituencies are formed on the basis of contiguity, communications, absence of natural barriers, cultural and ethnic homogeneity. After they are formed, certain constituencies are selected as reserved. In the case of the Scheduled Tribes seats there is a single standard for selection — concentration of the Scheduled Tribe population [25] Since typically the tribal population lives in areas of concentration the constituencies reserved for them contain a high proportion of Scheduled Tribes.[26] In 1962, the Scheduled Tribes comprised more than 50 per cent of the population in 18 of the 31 Lok Sabha constituencies reserved for them.[27] Conversely, most of the major concentrations of Scheduled Tribes population are located in reserved constituencies. Of the 29 constituencies in which Scheduled Tribes comprise over 40 per cent of the population, 23 are reserved. Thus the reserved seats encompass the bulk of the Scheduled Tribes population — perhaps close to 70 per cent. These constituen-

cies are, not surprisingly, more isolated and much less urban than are the general constituencies.

In the case of seats reserved for Scheduled Castes, the Commission is instructed to apply two standards — concentration of Scheduled Caste population and dispersal of reservations. The Delimitation Act instructs the Commission to locate seats reserved for Scheduled Castes "in different parts of the State and . . . as far as practicable, in those areas where the proportion of their population to the total is comparatively large".[28] The Delimitation Commission achieves this by first reserving the constituencies with the highest concentration of Scheduled Castes — usually not much more than 20 per cent — and then selecting the others by the dispersal criterion. Since the Scheduled Caste population, unlike the Tribes, is rather evenly dispersed, the constituencies reserved for them contain far fewer Scheduled Caste members. Among the 76 Lok Sabha constituencies reserved for Scheduled Castes in the 1962 elections, there was none in which they comprised a majority of the population and only 13 in which they comprised as much as thirty per cent.[29] The bulk of Scheduled Castes constituencies contain between 10 and 30 per cent of Scheduled Castes. Thus, the vast majority of Scheduled Castes — perhaps 75 per cent — live outside the constituencies reserved for Scheduled Castes. Of the 111 Lok Sabha constituencies where Scheduled Castes comprised more than 20 per cent of the population, in 1961 only 46 are reserved, while 29 constituencies with less than 20 per cent are reserved.

Like the Scheduled Tribes constituencies, those reserved for Scheduled Castes tend to be political backwaters — slightly less urban, with less newspaper circulation and a slightly greater percentage of agricultural labourers.

The same pattern of concentration of Scheduled Tribes and dispersion of Scheduled Castes reappears in the reserved seats in the state legislatures. In Andhra Pradesh for example, Scheduled Castes make up only 21 per cent of the population of the constituencies reserved for them (and 13 per cent of the population of the general constituencies). But Scheduled Tribes comprise 43 per cent of the population of the constituencies reserved for Scheduled Tribes and only 2 per cent of the general constituencies.[30]

Designation of a constituency as reserved usually encounters opposition.

> While everyone expressed anxiety that the Scheduled Castes and the Scheduled Tribes should get their full quota of reserved seats, very rarely indeed would anybody (unless he himself belonged to any of these castes or tribes) agree to any seat being reserved for them in a constituency in which he was personally interested.[31]

The selection of reserved constituencies gives rise to the bulk of the objections to the proposed delimitation. As the Election Commissioner reports,

> generally speaking the vocal sections of the public objected to their own areas becoming part of a reserved constituency and put forward ingenious suggestions for reshaping two or more constituencies so that some particular constituency would be a general constituency.[32]

However, these objections rarely bring about a change. The courts will not provide any relief so long as the Delimitation Commission has taken into account the factors specified by the Delimitation Act.[33] Proposals for rotation of reserved constituencies have been rejected and their location has remained relatively stable.[34]

NON-RESERVED SEATS

Of course, Scheduled Caste and Tribe candidates may stand for non-reserved seats. However, they have been notably unsuccessful in winning elections to them. In the first six Lok Sabhas, only

the extent to which [illegible] have been implemented or their effectiveness.

* According to RCSCST the House discontinued the keeping of records of SC and ST members. No subsequent information available except as noted.

** As reported by the Minister of State for Home Affairs. Noted as partial information including members from major parties only.

† Figures on total seats are taken from Ministry of Information and Broadcasting, "India : A Reference Annual" as shown in brackets.

†† Noted in sources as previous years' figures.

a handful of candidates from Scheduled Castes or Tribes filled unreserved seats.[35] In the lower houses of the State legislatures, the record is no more heartening, even though the smaller constituencies mean that local concentrations of population and resources should offer more opportunities for political success. An approximate count of Scheduled Caste and Tribe victories in unreserved seats is given by Table 5.

There is no reservation of seats in the indirectly-elected upper houses at both Centre and states. The Rajya Sabha at the Centre is elected by proportional representation by the members [illegible] the State Legislative Assemblies.[36] [illegible] number of Scheduled Caste and Scheduled Tribe members in the Rajya Sabha is shown in Table 6.

The upper houses (Vidhan Parishads) [illegible] state legislatures that have [illegible] are chosen by a more complicated [illegible], combining election by the [illegible] house, special qualified constituencies and governmental nomination.[37] [illegible] too, the number of Scheduled [illegible] and Tribes has remained fairly [illegible] shown in Table 7.

[illegible] is no constitutional require[illegible] statutory provision for reser[illegible] of political appointments within [illegible] legislatures [illegible] the government, such [illegible] ministerships[38] or member[illegible] on [illegible] committees. However, [illegible] early become a convention to have [illegible] least one Scheduled Caste cabinet minister at the Centre and in each of the states. The number of Scheduled Caste ministers at the Centre and the number of Scheduled Tribe ministers in the states has slowly risen, as indicated in Table 8.

Reservation of seats on elective bodies at the local level is not specifically provided by the Constitution, but such arrangements are allowed by Article 15(4) and nearly all the states provide such reservations by election, co-optation or nomination in various local bodies and in panchayats. In 1963, seats in local bodies were reserved for Scheduled Castes on the basis of population in Assam, Gujarat, Kerala, Maharashtra, Mysore, Punjab, Rajasthan and Uttar Pradesh. All of the other states except for West Bengal provided for some other form of representation in these bodies.[39] There is little data available on the extent to which these reservations have been implemented, much less on how effective they are.

Similarly, most of the states have made some provision for representation of Scheduled Castes and Tribes in panchayat bodies. In 1966 all the states except Bihar, Jammu and Kashmir, Orissa and West Bengal reserved seats in gram panchayats and most states provided for reservation or co-optation of members of these groups in the higher tiers of panchayat institutions.[40] But again there is no information about

II

Assessing the Benefits and Costs

There is no lack of assertions about the beneficial or detrimental effects of the reserved seats, and of the whole policy of compensatory discrimination. Yet any attempt to evaluate the working of reserved seats quickly founders for lack of evidence. Reliable data on the effects of these measures are sparse and spotty. But if the evidence is insufficient for a definitive evaluation, it does permit us to make a tentative assessment of the working of reservations in the legislatures.

I propose to begin this assessment by sketching the main arguments for and against legislative reservations. By sensitising us to the full range of issues at stake, this listing permits us to sort out the available evidence and helps us to formulate the questions that would inform a more conclusive account. Table 9 presents an illustrative array of the full range of claims that are made as to the various ways in which the reserved seats allegedly help or hurt the protected groups, others, and India as a whole. This list may be thought of as a specification of more general assertions about the costs and benefits of the whole policy of compensatory discrimination. (An attempt to sketch a more general list may be found in the Appendix.)

Rough and redundant as it is, this anthology of claims will provide us with a checklist that will help in devising appropriate standards for evaluating specific schemes. For convenience each claimed benefit is paired with the opposite claim of cost. It would simplify matters if each of these pairs represented points on a single dimension that could be unambiguously measured. Unfortunately, the most [illegible] can be claimed for them is that each is a composite of sometimes reinforcing but occasionally conflicting qualities that may conveniently be grouped together. Since the lines between the claimed effects are not always distinct, some overlap and redundancy is unavoidable. It was necessary, for convenience in labelling, to devise some rubrics that are not found in ordinary talk of these matters, imparting a somewhat stilted quality to the list. These claims are listed here in an order that proceeds roughly from the most focused and immediate to the most capacious and remote, from those which speak of impacts primarily on

the beneficiary groups to those which concern the shape and career of the whole society.

Recitation of this catalogue raises questions both of its status and of the author's stance. As to the first, it is clearly not a set of explanations of why these policies were adopted, although such goals undoubtedly played a part. It is a set of standards for judging these policies. But whose standards? Obviously they are the author's, but I would claim that they are more than the author's — a claim supported by their provenance, for they are refinements and generalisations of arguments found in current Indian discourse about these policies. I would claim further that the list encompasses most of the standards that would occur to a disinterested policy-maker. (By this mean a policy-maker concerned with these policies *per se* rather than with their implications for his political fortunes.) In this accounting of costs and benefits I have put to one side those benefits (and costs) that accrue to individual actors from supporting or opposing a particular programme (apart from some that enter incidentally under the heading of diversion). This is not because I suppose that policy-makers omit consideration of the personal and political gains and losses that such positions entail. The course that policy takes is very much shaped by this second level of costs and benefits. But although any given actor may have his own schedule of priorities and his own admixture of second-level objectives, almost all would share at least some part of the goals implied by these standards. That actors differ in their priorities and goals as well as in their estimates of fact does not reduce the usefulness of exposing and articulating standards for judging these policies.

The remainder of this article is an attempt to assemble information relevant to these arguments. The heavy emphasis on representation is not meant to attribute an overwhelming primacy to that factor. Nor is it implied that all of these dimensions are to be accorded equal weight in evaluating legislative reservations in themselves or the overall working of compensatory discrimination policies. Presumably specific schemes in different fields (education, housing, etc) or for different groups (Scheduled Castes, Scheduled Tribes, Other Backward Classes) have a different mix of intended effects. And, presumably, the relative weight to be assigned to those effects (and to unintended by-products) will vary among various participants and observers. These standards may help us to identify divergent goals as well as common ones.

REPRESENTATION OR MISREPRESENTATION

We may safely conclude that the presence of the Scheduled Castes and Tribes in legislative bodies is accounted for largely by the provisions for reserved seats. Very few members of these groups have been successful in open competition. (Tables 4 and 5) Even their presence in bodies where there is no reservation (upper houses, cabinets) is due largely to the political base provided by reservations. Thus reservations do provide for a substantial quantitative presence that would otherwise be lacking.

We cannot infer that without reservations, representation would be reduced to the present level of success in non-reserved seats. Their geographical concentration would assure the Scheduled Tribes at least a modicum of representation even in the absence of reservations. The more dispersed Scheduled Castes would undoubtedly obtain far fewer seats than they now enjoy, but we should not conclude that they would have none at all. If there were no reservations, some of the political talent among the Scheduled Castes now competing for reserved seats would compete for non-reserved seats. Parties would then need appealing candidates in areas with heavy concentrations of Scheduled Castes; perhaps slate-makers would be less moved by the sense of "they already have their share" that now seems to affect the giving of tickets. (And of course, some representation would be provided by legislators from other groups who would be accountable to constituencies with sizeable numbers of Scheduled Caste voters.)

Perhaps the best indication of the scale of representation that might be expected in the absence of reserved seats is provided by some data on elections to local bodies where no reservations were in force. In the early 1960s local bodies in West Bengal with a total of 1,081 members contained only 41 Scheduled Caste members (3.8 per cent) and 16 Scheduled Tribe members (1.5 per cent).[41] Among the 66 Presidents and Chairmen there were 3 Scheduled Caste members and 1 Scheduled Tribe. (According to the 1960 Census, 19.84 per cent of the population of West Bengal were Scheduled Castes and 5.91 per cent were Scheduled Tribes.)[42] A similar picture is presented by some fragmentary data from Gujarat where only 35 (0.5 per cent) of 6863 Sarpanches were from the Scheduled Castes.[43] The electoral experience of India's other large and (mostly) low status minority, the Muslims, does not offer additional reassurance.[44]

The effect of reservation of seats on

the quality of representation is even more difficult to assess. How well served are the residents of the reserved constituencies? And, apart from them how well served are the members of Scheduled Castes and Scheduled Tribes — a great majority of the former — who reside outside the reserved constituencies? In what sense do the reserved seat legislators represent them? Does the presence of their fellows in reserved seats assure that they are better served by their own representatives? Finally, is the nation as a whole well served by these legislators? What effect do they have on the working of the legislatures?

In assessing the quality of representation afforded by these representatives, we must recall the structural constraints imposed by the arrangements for reserved seats. Reserved seats were provided on the ground that the nation as a whole has an interest in affording these groups more representation than they would gain spontaneously in the political process. Presumably this implies a recognition that in the short run there will be some divergence of interests and outlook — at the least on questions of priorities — between these groups and the rest of the population. (Where no major divergence of interest and outlook anticipated, the reserved seats might be supported on some other grounds than representation. While other goals — notably integration, acceptance, redistribution and incubation do play a part — it is generally assumed that representation is the basic argument for reserved seats.) Presumably separate electorates would accomplish this more directly and forcefully. But separate electorates were decisively rejected in favour of joint electorates with reserved seats.[45] Thus in order to promote integration and acceptance, the reservations are designed in a way which filters and muffles the representation of the interests of the Scheduled Castes and Tribes in so far as they diverge from the interests of other groups. The reserved seat legislator — especially from the Scheduled Castes — is responsible to and dependent upon a constituency made up overwhelmingly of non-members of his group. Thus the reservations insure representation to distinctive community interests only to the extent that it can be secured by communal loyalty against the pull of political motivations. Representatives who occupy reserved seats can be expected to elevate the interests of Scheduled Castes, etc, over those of their constituents only to the extent that one assumes the Scheduled Caste representatives will be more responsive to the pull of ascriptive ties than to the expediencies of gaining and holding office. But to the extent that these reserved seat legislators are assumed to be responsible and prudent politicians, this arrangement serves as a filter to keep the divergent interests of these groups from being expressed too directly or forcefully. This is especially the case with the Scheduled Caste representatives, whose constituencies are populated overwhelmingly by others.

Assessment of the quality and effectiveness of the representation afforded by the reservations would entail examination of the reserved seat legislators' voting behaviour, their sponsorship of legislation, their role in party affairs, in cabinets and committees, their participation in questioning and debate, and their activities "behind the scenes". No investigator has undertaken such an assessment. Hence we have to attempt to piece together a tentative picture from the fragmentary evidence that is available.

From a handful of studies we may draw a composite portrait of the Members of Parliament who occupy reserved seats.[46] They are younger and more rural in residence than their fellow legislators; fewer have professions (other than landholding) and they have less formal education. The median age of reserved seat MPs is in the early forties; that of their fellows in general seats is in the early fifties. The disparity in age has remained constant over successive Lok Sabhas, but the gap in educational attainments has narrowed appreciably. In the Third Lok Sabha, for example, roughly 60 per cent of occupants of general seats held bachelor's or higher degrees, compared to 30 per cent of Scheduled Caste MPs and 35 per cent of Scheduled Tribe MPs. In the Fifth Lok Sabha, 53 per cent of Scheduled Caste and 37 per cent of Scheduled Tribe MPs were degree holders, while the general seat MPs remained at about 60 per cent.[47] Similarly the occupational and residen-

tial profile of reserved seat legislators seems to be becoming more like that of the MPs in general seats. But those in reserved seats continue to be younger. They are younger when they are first elected to Parliament and, unsurprisingly, come there with less legislative experience at the state level.[48] From a single study we may surmise that similar disparities might be found in state legislatures.[49]

It is widely believed that reserved seat legislators are less articulate, less assertive and less independent than their fellows. From data on the Third Lok Sabha collected by Henry Hart, we may distill a tentative picture of the parliamentary activity of reserved seat Members of Parliament. Even apart from the limitations of the present analysis,[50] it would of course be illegitimate to take this picture as reflective of current conditions. And it should also be emphasised that we would be on shaky ground generalising from data on Parliament to conclusions about the working of reserved seats in the state legislatures. Nevertheless the data does enable us to see the legislative reservation device in action, and it may provide a useful baseline for comparison with later or state data.

The Hart data supplies some evidence for the view that reserved seat holders were as a group less active parliamentarians than those elected to general seats. Lok Sabha members in reserved seats were less likely to hold party office (Table 10) or to serve on select or standing committees (Tables 11-12) or to hold ministerships. During any one of these years, an average of 12.5 per cent of the general seat legislators were ministers, compared to 8.9 per cent of the holders of Scheduled Caste seats and 2.2 per cent of holders of Scheduled Tribe seats.

The reserved seat legislators participated less in debate — indeed almost half were silent, compared to a quarter of the general seat holders (Table 13). On Hart's index of overall parliamentary activeness, the Scheduled Tribe reserved seat holders were somewhat less active and the Scheduled Caste reserved seat holders far less active than the occupants of general seats (Table 14). Together the Scheduled Caste and Tribe representatives occupied over 21 per cent of the seats, but they made up only 10.1 per cent of the most active stratum of the Lok Sabha — and 35.3 per cent of the least active stratum.

However, these forms of participation do not offer a full measure of the way in which legislators work to shape

TABLE 9 : ASSERTED BENEFITS AND COSTS OF RESERVATION OF LEGISLATIVE SEATS FOR SCHEDULED CASTES AND SCHEDULED TRIBES

	Benefit		Cost
(1)	**RE-DISTRIBUTION** Reservation of seats effects a direct channelling of valuable resources to SC and ST. Good jobs, patronage, personal influence, access to high places, prestige and all the benefits that go with being a legislator are provided to the SC and ST in a much greater measure than they would otherwise enjoy.	*vs*	**DIVERSION** The resources provided directly by reservations do not spread to the benefit of the SC and ST, but are confined to a small privileged group within them, narrowing and distorting the representative character of the reserved seat holders.
(2)	**RE-RESENTATION** Reserved seats cause the presence of those who effectively represent the interests of the SC and ST, interests that would otherwise be underrepresented and neglected. Especially, the presence of the reserved seat legislators helps to insure that resources and attention are deployed to attend to the special needs of SC and ST.	*vs*	**MISREPRESENTATION** Reserved seat legislators do not represent the interests of the SC and ST accurately or effectively. New narrower interests which diverge from those of the SC and ST are created by legislative reservations.
(3)	**INTEGRATION** Reservation of seats affords a level of participation in political life that engenders among the SC and ST feelings of belonging and of having a stake in the system, thus promoting their political and social integration into Indian society.	*vs*	**ALIENATION** By emphasising their sparateness, reserved seats school SC and ST to regard themselves as outside Indian society and reduce their feelings of (and opportunities for) common participation.
(4)	**ACCEPTANCE** Reserved seats induce in others an awareness that SC and ST are significant actors in Indian public life, who are capable of acting in responsible roles and whose interests must be taken into account.	*vs*	**REJECTION** Frustrated and alienated by what they regard as unwarranted preference, others are educated to regard the SC and ST as separate and distinct sections of the population who enjoy their own facilities and have no claim on general public facilities and opportunities.
(5)	**INTEGRITY** Reserved seats promote pride, self-respect and a sense of self-sufficiency that will enable SC and ST to participate fully in public life as willing partners.	*vs*	**MANIPULATION** Reserved seats subject the SC and ST to manipulation by others aggravating their sense of dependence. By singling them out for special treatment, reserved seats undermine their sense of dignity, self-sufficiency and political efficacy.
(6)	**INCUBATION** By providing an arena protected from outside competition, temporary reservations stimulate the acquisition of political skill, experience, confidence, ties and other resources. Reservations thus help to promote the kind of vigorous and skilled leadership needed by the SC and ST leadership capable of flourishing in open competition.	*vs*	**OVER-PROTECTION** The artificially protected sanctuary of reserved seats blunts the development of political resources by protecting politicians from vigorous competition.
(7)	**MOBILISATION** Reserved seats provide an institutional base for organised action, enhancing the capacity of the SC and ST to engage in concerted efforts to address their common problems.	*vs*	**ENERVATION** The artificial protection of reserved seats and the relations of dependence they foster reduce initiative, blunt the development of skills and reduce capacity for sustained, organised effort by the SC and ST
(8)	**STIMULATION** The presence of reserved seat legislators promotes awareness of and creates political incentives for responsiveness to the needs of the SC and ST.	*vs*	**SEDATION** The presence of reserved seat holder encourages others to disavow direct responsibility for the well-being of the SC and ST.

(Continued)

TABLE 9 CONTINUED

	SELF-LIQUIDATION These benefits may be viewed as mutually reinforcing. Their cumulative effect will be to render unnecessary any special provision for reserved seats. In this view, representation (assisted by redistribution) by amplifying mobilisation and stimulation will promote the advancement of these groups to the point that their interests converge with those of the wider public; incubation will promote a vigorous political leadership capable of representing them without special insulation from competition; as they become politically self-sufficient and more integrated, they will gain acceptance and enjoy integrity that will make it possible for them to function without reservation.	vs	SELF-PERPETUATION Alternatively, reserved seats may be viewed as producing a set of mutually reinforcing negative effects. In this view, misrepresentation and diversion create new narrow vested interests; over protection and enervation blunt the development of political leadership that could supply effective representation; these arrangements promote divisiveness, preventing integration, promoting rejection by others and undermining the integrity of the SC and ST.
(10)	FAIRNESS Reserved seats redistribute opportunities for participation on a scale that would be unimaginable in their absence, offsetting a maldistribution of such opportunities stemming from accumulated and unjust past disadvantages.	vs	UNFAIRNESS Reserved seats bestow and restrict opportunities for participation in ways that are arbitrary and unconnected with desert or culpability.
(11)	SECULARISM By reducing invidious disparities between communal groups, reserved seats lead over the long run to the reduction of the salience of communal identity in public life.	vs	COMMUNALISM Reserved seats by recognising and stimulating claims based on communal identity, increase the salience of communal identity in public life.
(12)	DEVELOPMENT Reserved seats contribute to national development by promoting the incorporation of excluded groups into national life.	vs	STAGNATION Reserved seats impede development by skewing legislative priorities from developmental tasks to ineffectual redistributive measures.

government action. It appears that the reserved seat holders had as much contact with constituents, both by touring and (except for Scheduled Tribe legislators) by letter. There is no indication, though, that they had a particularly large amount of contact with Scheduled Castes or Scheduled Tribes outside their constituencies. Reserved seat holders were themselves oriented to issues of Scheduled [illegible] and Scheduled Tribes. The de[illegible] of their constituents, as reserv[illegible] legislators reported them, were [illegible] intensely "communal" than those [illegible] by other members of Parlia[illegible] But the pattern, as Table 15 [illegible] a very mixed one, for a siz[illegible] of Scheduled Caste [illegible] "communal" de[illegible]

[illegible] that they were less [illegible] these demands in [illegible] or [illegible] work. [illegible] with mini[illegible] [illegible] did transmit [illegible] extent than legislators, they dealt almost exclusively with constituency matters rather than with general issues, as shown in Table 17.

We may conclude that the occupants of reserved seats were probably less influential than other legislators in shaping policy. This is confirmed by their own subjective impression — far fewer of them felt that they were effective advocates of their views (Table 18).

Obviously one must be extremely cautious in extrapolating from this data about the Third Lok Sabha to more recent performance under changed conditions, much less to conditions that might prevail in the future. Since the reserved seat legislators have come to resemble their fellows in terms of education, occupation and urban residence, there may also be a convergence in legislative behaviour. Or it may be that changes in political alignments have accorded reserved seat legislators a greater voice and elicited new patterns of participation. And one may, of course, wonder whether the most important sorts of representation are accurately depicted in terms of the measures of participation that we have employed.[51]

Low rates of participation do not imply a proportionate absence of effective representation of the interests of Scheduled Castes and Tribes. Presumably the activities of reserved seat legislators are concentrated on matters which affect these groups,[52] and their effectiveness in representing the interests of these groups should be most evident in dealing with matters which contribute directly to their welfare; (1) establishing programmes of which they are the beneficiaries; (2) insuring deployment of resources to these programmes; (3) pressing for better administration of these programmes; (4) resisting cut-backs and premature termination of such programmes. Although I have no systematic data, there is impressionistic evidence to suggest that, in the Lok Sabha at least, reserved seat legislators have been prominent and influential in matters concerning the working of the preference policy. Expenditures for Scheduled Caste and Tribe schemes have continued to rise — in contrast to those for the Other Backward Classes. The reserved seat legislators demonstrated their political prowess by killing the 1965 Lokur Committee report which called for the de-scheduling of some tribes and castes. The dissatisfaction of the reserved seat members was instrumental in bringing about the government's first defeat in the Lok Sabha in 20 years, a stunning snap vote on a 1967 motion that the constitutional safeguards for Scheduled Castes and Tribes were not being fully implemented.[53]

This new assertiveness was followed by government's repudiation of the Lokur recommendations, appointment of new deputy ministers from among the Scheduled Castes, liberalisation of the rules for reservations in promotions in government services, increasing the reservations in direct recruitment, and (after years of promises) making converts to Buddhism and Christianity eligible for post-matriculation scholarships and increasing the reservations in direct recruitment.[54]

The presence of the reserved seat legislators, if not in itself likely to raise the level of benefits, does seem to serve as a warrant of the continuation of these programmes at their existing levels. Furthermore, their presence in such numbers provides a quantitative basis for Scheduled Caste and Tribe participation in leadership at the cabinet level; it is unlikely that there would be many persons from these groups in cabinets were it not for the reserved seats. It appears that the

initiation and expansion of programmes for these groups is associated with the presence of group members in cabinet posts. The first reservations in government service were established by the efforts of the first Scheduled Caste member of the Viceroy's cabinet. Job reservations were first extended from initial appointments to the promotion stage under the auspices of the next Scheduled Caste politician became minister. Similarly, at the state level : the first extension of reservations to the promotion stage occurred when a Scheduled Caste politician became chief minister of Andhra; the ascension of a Scheduled Caste Home Minister in Madras was followed by a dramatic increase in the vigour of prosecution under the Untouchability (Offences) Act.[55]

The potential leverage enjoyed by the occupants of reserved seats varies with the balance of party power in the legislatures. The more evenly balanced the party alignment, the greater the potential impact of the reserved seats.[56] The erosion of single party dominance and the trend toward more evenly balanced legislatures seems to portend an increase in the potential of the reserved seat legislators to influence public policy.

INCUBATION vs OVER-PROTECTION

While available data do not allow us to draw any conclusions about the degree of successful incubation, they suggest there is little over-protection. Reserved seat legislators, as we noted before, are younger and less educated. They have proved able to retain their seats in successive elections; this may reflect not only increased political skill but the still limited supply of political resources to challenge them — an explanation which accords with the fact that there are fewer candidates in reserved seat contests There has been no increase in the success of Scheduled Castes and Tribes in competition for non-reserved seats (which reflects rejection by others as well as the fact that to those eligible to stand for them, reserved seats represent an attractive return for limited political resources). If incubation is taking place — and there is some indication that there has been a great growth in political skills, experience, ties etc — it is very doubtful that it has reached a point where many could successfully compete without the reservations.

REDISTRIBUTION vs DIVERSION

Reserved seats clearly have a substantial redistributive effect. Not only through their law-making activities, but through their ability as legislators to intercede, obtain contracts and distribute patronage, reserved seats produce a substantial flow of resources to *these groups.*[57] *Not least among* these resources is official attention. As one of the respondents in Aggarwal and Ashraf's Haryana study expressed it,

> If reservation in elections is withdrawn Harijans will lose influence. Today if I have any serious problem I can go to a Harijan MLA or MP. He understands our problems fully. Officers listen to our problems only when they know that our MLA or MP is a Harijan.[58]

If one doubts that the effects are consistently so dramatic it is certainly plausible that they are significant.

I have no basis for estimating how widely these benefits are spread or whether they are, as often alleged, confined to a narrow segment within the more numerous and politically dominant Scheduled Castes and Tribes.[59] The demands put forward by Scheduled Caste legislators are disproportionately attentive to those of their fellows who already have something[60] (e g. the great attention to higher government posts) and are in a position to make demands on them, but there is no evidence that this is more the case with them than with their fellow legislators.

STIMULATION vs SEDATION

In the 1969 debate on extension of the Constitutional provisions for reserved seats, M R Masani made the interesting observation that "this reservation . . has put the conscience of the upper class and the upper castes to sleep ".[61] Reserved seats, as the most visible component of the policy of compensatory discrimination, may indeed be responsible for some diminution of non-governmental concern for the Scheduled Castes and Tribes. Thus Lelah Dushkin reports a general tendency to assign responsibility for these groups to government, absolving other elites of any responsibility for their betterment.[62] The educated public vastly overestimates the amount and effectiveness of preferential treatment and the viability of legislators in reserved seats may reinforce this perception of indiscriminate indulgence and erode the support that compensatory discrimination formerly enjoyed.[63] While it is plausible that there would be more non-governmental action in the absence of institutionalised compensatory discrimination, it seems highly unlikely that the total resources diverted to these groups would be as great. (The mix might be less favourable to the upper end of the scale, though, and it is arguable, but unproven, that such 'voluntary' aid would be more effective than that afforded by the government.) And if reserved seats erode public support for preferential treatment, they must be credited with

one massive accomplishment : the presence of Scheduled Castes and Tribes in every legislative setting in sufficient numbers so that issues of concern to them cannot be dismissed or ignored indefinitely.

INTEGRATION *vs* ALIENATION

Reserved seats are clearly integrative in several ways. The holders of reserved seats tend to be members of national political parties. Those who aspire to fill them are constrained to campaign for the votes of those outside their group — this is especially the case with Scheduled Castes. Satish Saberwal observes that reserved seats do not promote separatism since they require candidates to aggregate broad multi-caste support. (Separatist sentiment, he finds associated with despair of gaining acceptance.)[64]

Rank and file members of the Scheduled Castes and Scheduled Tribes, it is sometimes asserted, are alienated by being treated separately in the administration of compensatory preferences. There is undoubtedly some distress associated with identifying oneself as recipient, although it is not clear whether it is because of the existence of separate facilities or from the personal rejection that is expected to follow upon such identification. This is probably less so with reserved seats in legislatures than with educational and job benefits. Whatever sense of alienation is conveyed by reserved seats surely pales into insignificance beside such manifestations of hostile feeling as the much publicised assaults and atrocities perpetrated on Scheduled Castes. All systematic evidence suggests that the recipient groups welcome the extensive symbolic participation that reserved seats afford and regard them as a useful safeguard of their interests.[65]

ACCEPTANCE *vs* REJECTION

Reserved seats are more offensive to non-members of the Scheduled Castes and Tribes than to members of these groups.[66] This is evidenced by resistance to the placement of reserved seats and by massive withdrawal of voters from participation in elections for reserved seats, particularly in Legislative Assembly contests.[67] Apparently, large numbers of people do not feel represented by these legislators and do not care to participate in choosing them.[68] This parallels the unwillingness to have representatives from these groups in unreserved seats (see Tables 4 and 5). Reservations may aggravate rejection, but rejection obviously exists independently. The aggregate evidence gives little indication of acceptance by voters. Unfortunately we are almost entirely in the dark about the attitudinal effects upon a constituency of being represented by a Scheduled Caste.[69]

But at the policy-making level, reserved seats have secured the acceptance of Scheduled Castes and Tribes as groups whose interests and views must be taken into account. In every legislative setting they are present in sufficient numbers so that issues affecting these groups remain on the agenda. Anything less than respectful attention to their problems, even if only lip service, is virtually unknown.[70] Overt hostility to these groups is taboo in legislative and many other public forums.

INTEGRITY *vs* MANIPULATION

The reserved seat device entails considerable potential for manipulation. Candidates, dependent on parties for funds and organisation, may be selected on grounds of their acceptability to others rather than by virtue of forceful representation of the interests of the preferred groups. This dependence is compounded in the Scheduled Caste constituencies, with their overwhelmingly non-Scheduled Caste population. In his study of UP politics, Paul Brass observes that

> For the most part, the Scheduled Castes in Uttar Pradesh have accepted the patronage of the Congress government and have given their votes to the Congress Party in return. The Scheduled Caste leaders who have been given Congress tickets in the reserved constituencies are non-militant and have no power in the local or state Congress organisations.[71]

This portrayal is confirmed by Narayana who concludes that reserved seats tend to produce "accommodating leaders who draw significant support from the upper castes" rather than candidates who identify with the interests of the Scheduled Castes and are supported by them.[72]

The participation afforded by reserved seats is in some eyes outweighed by the sacrifice of integrity (and representation) they entail.[73] Thus by 1955, Ambedkar who had fought so long against Congress opposition to obtain the reserved seats, called for their abolition[74] — a call that has been echoed by others since. Apparently the doubts about reserved seats that assail thoughtful Scheduled Caste activists are not widely shared by the rank and file.[75] Of course, the attraction of termination depends on one's estimate of the quantity and quality of representation that could be secured in an open political arena without any safeguards.

MOBILISATION *vs* ENERVATION

Reserved seats help develop political skills among the Scheduled Castes and Scheduled Tribes and bring forth a cadre of political leaders. One wonders whether reserved constituencies produce more unified action,[76] more effective bargaining or more dynamic leadership than emerges from participation in coalitions in non-reserved constituencies.[77]

TABLE 16: AMOUNT OF LOBBYING OF MINISTERS BY MEMBERS OF LOK SABHA

Contact with Ministers	Type of Seat		
	General	SC	ST
Does not talk to Ministers	11(9)	3(15)	3(25)

(A study comparing patterns of Scheduled Caste politics in reserved and non-reserved constituencies would be enormously revealing about such matters. So far as I can tell, it remains to be done.) The subordination and dependence of reserved seat legislators presumably limits the extent to which they serve as 'vigorous organisers' of their communities. Yet their visible presence in top positions, produced by the reservations, may have some mobilisational effects even outside the reserved constituencies. Again, we quickly reach the limits of available knowledge.

Reserved seats afford Scheduled Castes and Tribes a presence in the legislatures that is disproportionate to their share of political life. Yet their share of political life is probably greater than their share of any other sector of activity. Anil Bhatt's report of a four state survey (done in 1966-67) is suggestive of the level of political activity among Scheduled Castes.[78] He finds that although they are less interested in political matters and less knowledgeable, they vote slightly more and are as likely to have partisan affiliations.[79] They perceive themselves as less politically efficacious than others, which comports with a general perception that they are not influential.[80] They are less politically active in non-elective as well as elective settings: they initiate fewer contacts with government and the political elite (whom fewer Scheduled Caste people feel able to approach if needed).[81] Although they scored low on political activity, interest and perceived influence, there was a pronounced increase on all these measures among younger age cohorts.[82] A recent study by Eldersveld and Ahmed, based on 1967 and 1971 national surveys, confirms this portrait. They find Scheduled Castes and Tribes less interested and knowledgeable, but on a rough parity in party membership and portion of party activists.[83] These groups, they report, "constitute an increasingly large proportion of political participants as one moves along the scale from least to most [politically]* involved".[84]

Shares in political power reflect social status and economic prowess, but the translation is not exact. Calculating the disparities between *socio-economic* status and political participation, Bhatt concludes that differences in political participation are far narrower.[85] This is so for many groups, but it is markedly so for Scheduled Castes. More than any other stratum, their political participation far outruns what would be expected if political activity reflected socio-economic standing. There is no direct evidence to connect this to the reservation of seats in legislative bodies. But one may speculate that the reserved seats operate as a kind of forced draft inclusion of Scheduled Castes in the political system beyond what would flow from their resources. Generally, the structures of democratic politics shrink disparities among caste groups to a smaller magnitude than is found in ritual, social education or economic settings. That this equalising tendency is amplified by reserved seats is suggested by Bhatt's conclusion that the disparity between political participation and socio-economic standing is far greater for the Scheduled Castes than for the "low castes" just above them in the traditional hierarchy.[86]

SELF-LIQUIDATION OR SELF-PERPETUATION

Reservations of government posts or university admissions often operate as guaranteed minimums rather than as allotments of places over and above those gained on merit. Therefore the net amount of preference they confer automatically declines as members of the preferred groups gain places on merit. Reservations in the legislatures do not have this automatic self-liquidating feature. However, unlike other preferences, they alone are subject to a constitutional time limit — this limit has been twice extended. Since the presence of the reserved seat legislators undoubtedly contributed to this result, these reservations are in a literal sense self-perpetuating in a way that others are not. Furthermore, their presence helps to perpetuate other forms of preference. Indeed, that is their purpose. They can only perpetuate preferences to the extent that they are influential — so, self-perpetuation is a mark of some success in fulfilling their function of representation. Thus self-perpetuation is not to be accounted a negative feature in itself. The case against reserved seats gains no added strength from their self-perpetuating quality, unless the whole system of compensatory preference is thought to be unjustified or to have outlived its justification.

Although there is no time limit on constitutional authorisation of other forms of special treatment for Scheduled Castes and Tribes, one of the curious and significant things about the debate preceding the extension of reserved seats in 1959 and 1969 was the extent to which the public, press and many parliamentarians proceeded as if an end to reserved seats was the end of all benefits and concessions to these groups. There is no constitutional or legal foundation for such an equation. The

TABLE 19: VOTER TURNOUT BY TYPE OF SEAT

(in percentages, rounded)

	Lok Sabha			Legislative Assemblies		
	General	Scheduled Caste	Scheduled Tribe	General	Scheduled Caste	Scheduled Tribe
1962	57	54	44	59	48	42
1967	62	61	49	64	54	46
1971-1972	57	51	43	63	53	45

Sources: 1962 and 1967 from Dushkin 1972:195. 1971-72 from Election Commission 1973:184; Election Commission 1976:294.

political reservations seemed in many minds to encompass the entire system of compensatory preference and their extension was tantamount to heading off expiration of all benefits. This symbolic fusion may tell us something important about the way in which political reservations function to lock into place all the other programmes for Scheduled Castes and Tribes.

But of course that insurance function might be performed by other means — for example, by a constitutional guarantee of continued preferential treatment until Scheduled Castes and Tribes enjoyed specified levels of well-being relative to the rest of the population. It might thus be possible to de-link the assurance of continued special treatment from the reserved seat device, permitting the latter to be evaluated in terms of its specific benefits and costs, and enlarging the options for securing the former.

The difficulties of isolating the ffect of reserved seats from the effects of other components of the policy of compensatory discrimination are compounded when we come to the more global and diffuse sets of asserted costs and benefits at the end of our list (Table 9) — fairness *vs* unfairness, secularism *vs* communalism, development *vs* stagnatio.. The connection between reserved seats and these conditions is even less susceptible of measurement than the connections we have already surveyed.

Since we have concluded that reserved are a crucial (though not neces- irreplaceable) support of the larger of compensatory preference, the a isolate the effects of reserved [illegible] that of other components may a academic exercise. But pre[illegible] because [illegible]y are separable and [illegible] policy choices will focus explicitly on the reserved seats, it seems worthwhile to pursue a little longer in our focus on reserved seats to explore their relation to the broadest goals involved in the compensatory discrimination policy.

FAIRNESS *vs* UNFAIRNESS

The fairness argument is of course based on the principle of historical restitution: more specifically on the notion that due to the cumulative effect of past unjust deprivations, members of these groups on the whole have fewer resources (skills, standing, wealth, etc) with which to obtain the benefits that flow from the presence of their groups in legislative bodies. There are at least two separate arguments of unfairness: (1) that which rejects the principle of collective recompense for historic injustice; and (2) that based upon the unequal distribution of the burden of compensation.

The latter takes the form of a charge that it is unfair that the representation (and chances of political careers) of some should be impaired to provide such compensation, when there is no reason to suppose that those who are discomfited are more responsible for past invidious deprivations than are those whose representation and careers are undisturbed. Reserved seats are thus seen as the conscription of an arbitrarily selected group of citizens to discharge a debt, an obligation from which equally culpable debtors are excused.

The factual assumption of equal culpability might be challenged by an argument that there is some rough justice to the selection since the non-tribal population in constituencies with heavy Scheduled Tribe populations benefited from the past exploitation of the tribals and (even more tenuously) in areas with higher proportions of Scheduled Castes, the rest of the population were disproportionately beneficiaries of the exploitation of these groups. In the absence of a persuasive marshalling of evidence along these lines, it must be conceded that the reserved seat device does involve some unfairness of this second kind. Rotation might be a cure, but at a high cost: by rendering impossible the accumulation of experience, seniority and political strength, it would vitiate much of the value of the reserved seats. Separate electorates would avoid both arbitrariness of burdens and the drawbacks of rotation, but at a cost in integration that has been thought too high.

Even unfairness admits of more or less. Just how much of it there is is not clear. For politicians, the burden is mitigated somewhat by the absence of restrictive residence requirements, but clearly there is a barrier to novices. How much are inhabitants of reserved constituencies deprived of representation? Lower voter turnouts (see Table 19) suggest perceived deprivation is not negligible.[87] But it says nothing about how well non-Scheduled Caste constituents are served by their reserved seat legislators. Along with so much else, this question has remained immune from research.

The broader fairness argument that rejects the policy of historic compensation may take the form of objection to any attempt to distribute present benefits to remedy historic injustices. Or the notion of historic compensation may be accepted but objection taken to the distribution of benefits on the basis of group membership rather than individual desert. Compensatory programmes in India, such as reserved seats, have typically identified as beneficiaries members of castes (or tribes) on the ground that such groups are the carriers of the heritage of cumulative disadvantage which must be offset. This leads us to the question, implicated deeply in the design of compensatory discrimination policies, of the role of descent groups in Indian society, which we can take up under the heading of secularism *vs* communalism.

SECULARISM *vs* COMMUNALISM

The use of caste groups to identify the beneficiaries of compensatory discrimination has been blamed for perpetuating the caste system, accentuating caste consciousness, injecting caste into politics and generally impeding the development of a secular society in which communal affiliation is ignored in public life.

This indictment is open to doubt at a number of points. First, it is not clear

that th[illegible] ficiaries [illegible] role in the [illegible] of caste and politics. It is [illegible] vastly overshadowed by the franchise itself, with its invitation to mobilise support by appeal to existing loyalties. But the avowed and official recognition of caste in compensatory discrimination policy makes it a convenient target for those offended and dismayed by the continuing salience of caste in Indian life.

Caste ties and cast-based political mobilisation are not exclusive to Scheduled Castes and Tribes. The political life within these groups is not necessarily more intensely communal in orientation;[88] nor are the caste politics of greatest political impact found among these groups. Intellectual dismay at the unforeseen durability of caste has fastened on the reserved seats as the villians of the tale,[89] but the link has never been convincingly established.

The overestimation of the influence of reserved seat arrangements matches the overestimation of the amount of preference afforded the Scheduled Castes and Tribes. The widespread perception of ubiquitous and unrestrained preferment for these groups derives from several sources. First, there is the chronic overstatement of the effects of reservation: large portions of reservations (especially for cherished higher positions) are not filled, of those that are filled, some would have been gained on merit, so the net effect is often considerably less than popularly perceived. Second, ambiguous nomenclature and public inattention combine to blur the distinction between measures for Scheduled Castes and Tribes and those for Other Backward Classes. The resentment and dismay engendered by use of the Other Backward Classes category to stake out massive claims on behalf of peasant-middle groups (particularly in some southern states) are readily transferred to discredit the more modest measures for Scheduled Castes and Tribes.

Vigorous mobilisation of groups, it is now realised, is not necessarily inimical to democracy or secularism (unless these are defined in terms of an austere individualism that does not admit of any group presence in the political arena). Indeed mobilisation along group lines among the Scheduled Castes and Tribes may make a positive contribution to the realisation of the profoundly secular goals of compensatory discrimination — the dismantling of the traditional religiously-sanctioned hierarchy of groups in Indian society. Elderveld and Ahmed

(1)	**RE-DISTRIBUTION** Preference provides a direct flow of valuable resources to the beneficiaries in larger measure than they would otherwise enjoy.	*vs*	**DIVERSION** These resources are enjoyed by a small segment of the intended beneficiaries and do not benefit the group as a whole.
(2)	**REPRESENTATION** Preferences provide for participation in decision-making by those who effectively represent the interests of the beneficiaries, interests that would otherwise be underrepresented or neglected.	*vs*	**MISREPRESENTATION** By creating new interests which diverge from those of the beneficiaries, preferences obstruct accurate representation of their interests.
(3)	**INTEGRATION** By affording opportunities for participation and well being, preferences promote feelings of belonging and loyalty among the beneficiaries, thereby promoting the social and political integration of these groups into Indian society.	*vs*	**ALIENATION** By emphasising the separateness of these groups, preferences reduce their opportunities for (and feelings of) common participation.
(4)	**ACCEPTANCE** Preferences induce in others an awareness that the beneficiary groups are participants in Indian life whose interests and views have to be taken into account and adjusted to.	*vs*	**REJECTION** Preferences frustrate others by what they consider unfair favouritism and educate them to regard the beneficiaries as separate elements who enjoy their own facilities and have no claim on general public facilities.
(5)	**INTEGRITY** Preferences permit forms of action that promote pride, self-respect, a sense of achievement and personal efficacy that enable the beneficiaries to contribute to national development as willing partners.	*vs*	**MANIPULATION** Preferences subject these groups to manipulation by others, aggravate their dependency, and undermine their sense of dignity, pride, self-sufficiency and personal efficacy.
(6)	**INCUBATION** By broadening opportunities, preferences stimulate the acquisition of skills and resources needed to compete successfully in open competition.	*vs*	**OVER-PROTECTION** Preferences provide artificial protection which blunts the development of the skills and resources needed to succeed without them.
(7)	**MOBILISATION** By cultivating talents, providing opportunities and incentives and promoting their awareness and self-consciousness, preferences enhance the capacity of the beneficiary groups to undertake organised collective action.	*vs*	**ENERVATION** By making them dependent, blunting the development of talent, undermining self-respect, preferences lessen the beneficiaries' capacity for organised effort in their own behalf.
(8)	**STIMULATION** By increasing the viability of the beneficiary groups, promoting their placement in strategic locations, and emphasizing the national commitment to remedy their condition, preferences serve as a stimulus and catalyst of enlarged efforts for their uplift and inclusion.	*vs*	**SEDATION** By projecting an image of comprehensive governmental protection and preferment, preferences stir the resentment of others, allaying their concern and undermining initiative for and support of measures to help the beneficiary groups.
(9)	**SELF-LIQUIDATION** The benefits of preferential treatment are mutually reinforcing and will eventually render unnecessary any special treatment.	*vs*	**SELF-PERPETUATION** These arrangements create vested interest in their continuation, while discouraging the development of skills, resources and attitudes that would enable the beneficiaries to prosper without special treatment.
(10)	**FAIRNESS** Preferences compensate for and help to offset the accumulated disablements resulting from past deprivation of advantages and opportunities.	*vs*	**UNFAIRNESS** Preferences place an unfair handicap on individuals who are deprived of opportunities they deserve on grounds of equality or merit.
(11)	**SECULARISM** By reducing invidious disparities among groups and directing attention to mundane rather than ritual standing, preferences promote the development of a secular society.	*vs*	**COMMUNALISM** By recognising and stimulating group identity, preferences perpetuate invidious distinctions, thereby undermining secularism.
(12)	**DEVELOPMENT** Preferences contribute to national development by providing incentive, opportunity and resources to utilise neglected talent.	*vs*	**STAGNATION** Preferences impede development by misallocation of resources, lowering of morale and incentive, and waste of talent.

of [illegible] Harijans and Tribals a high level of caste consciousness seemed connected with higher participation in public life.

> ....our data support the proposition that Indians who were very aware of, and approved of, the political aspects of caste — perceptually, normatively, behaviourally — had a high percentage of people considerably involved in party politics and the election process.... Modern orientations generally seem to be linked to higher activity for most caste groupings.... [But] *for lower caste groups, particularly the Harijans and Tribals* those who "value" caste and appear to identify normatively with "caste" and "tradition" have extremely high levels of participation ... In the lowest social strata of Indian society, where traditional orientations predominate, high levels of involvement with 'modern' political institutions are revealed.[98]

One wonders whether this association of strong caste identification and high levels of political participation can be connected with reserved seats, either as a structural effect observable in reserved constitutencies or generally as a mobilisational effect of the reserved seats.

Development vs Stagnation

As a forced draft programme of inclusion of Scheduled Castes and Scheduled Tribes within national life, compensatory discrimination has been a partial and costly success. Although few direct benefits have reached the vast mass of landless labourers in the villages, it has undeniably succeeded in accelerating the growth of a middle class within these groups — urban, educated, largely in government service. Members of these groups have been brought into central roles in the society to an extent unimaginable a few decades ago. There has been a significant redistribution of educational opportunities to them; there is a sizeable section of these groups who can utilise these opportunities and confer advantages on their children; their concerns are firmly placed on the political agenda and cannot readily be dislodged. But if reserved seats are part of this self-sustaining dynamic of inclusion, there is at the same time a lesser counter-dynamic of resentment, rejection, manipulation and low self-esteem. And these gains are an island of hope in a vast sea of neglect and oppression.

The general pattern of the past decades might crudely be summarised as development at the upper end and stagnation at the bottom. Compensatory discrimination means that a section of the Scheduled Castes and Scheduled Tribes has been incorporated into the modern class manning the organised sector. What does this portend for the bulk of untouchables and tribals who remain excluded and oppressed? Are they better or worse off by virtue of the fact that some members of their descent group have a share in the benefits of modern India. The meaning of reserved seats and of compensatory discrimination policy ultimately depends on how one visualises the relation of this new elite to the masses of Scheduled Castes and Scheduled Tribes.

III

Conclusion

This year will see a new debate over the further extension of the reserved seats. During the 1969 debates there were undertones of opposition, but the final vote for extension was unanimous. Resentment of Scheduled Caste 'privileges' is more overt more intense now. It seems unlikely that the debate will be as subdued as that of ten years ago. Although Indian intellectuals, including some eminent social scientists, have passed severe judgments on compensatory discrimination policies, it is only in the last few years that systematic research on their effects has been undertaken. And unfortunately very little of it has touched on the reserved seats. Thus it seems unlikely that this year's debate will be informed by the comprehensive "scientific study" called for ten years ago.

The absence of more ample data is especially regrettable because one can so easily imagine feasible studies that would be immensely revealing about the benefits and costs of reserved seats. Perhaps more studies (including re-analyses of existing data) will surface before the year is out. But it should be remembered that for purposes of deciding whether reserved seats should be extended or terminated, the collection and analysis of data about their performance is only a first (though essential) step. The policy decision involves at least three major sorts of questions beyond the estimation of costs and benefits up till now.

First, once a pattern of costs and benefits is ascertained, there is the question of whether it can be expected to continue in the future. Is there any reason to think that one or another benefit or cost might be amplified or diminished during the next period for which reserved seats are to be extended? Are there reasons to expect that the coming period would be one to reap cumulative benefits or one in which there would be diminishing returns?

Second, since the [illegible] dangers of the compensatory discrimination policy are multiple and incommensurable, an evaluation of costs and benefits requires that some kind of weights and priorities be assigned to these goals or dangers. These can be supplied only by a vision of a future society that unites the desirable with the possible.

Third, evaluation must be comparative. Acceptance or rejection of the package of benefits and costs believed to be associated with reserved seats must be compared with the costs as well as the benefits anticipated to arise from any alternative that is believed preferable — a regime of income tested preferences, or double votes, or a separatist solution. And, of course it is necessary to make the case for the feasibility as well as the preferability of any alternative.

Notes

[This paper is largely drawn from my forthcoming book, "Competing Equalities: The Indian Experience with Compensatory Discrimination". I would like to acknowledge the capable assistance of Robert M Hayden, Catherine Meschievitz and Hugh A Ross, Jr. I am specially indebted to Henry C Hart of the University of Wisconsin, Madison for generously allowing me to utilise data that he collected. Obviously he shares no blame for my interpretation of them. I am grateful to Thomas Hone of Indiana University for computing the Hart data and helping me to understand it.

The following abbreviations are used for frequently cited material:

AIR = All-India Reporter
CAD = Constituent Assembly Debates
ELR = Election Law Reports
RCSCST = Reports of the Commissioner for Scheduled Castes and Scheduled Tribes].

1 Dushkin 1961: 1667.
2 Temporary preferences for yet another group, the Anglo-Indians, were not based on their backwardness but were designed to cushion the loss of the privileged position they had earlier enjoyed.
3 On the identity and size of the Other Backward Classes, see Galanter 1978.
4 Article 330.
5 Article 332.
6 The Constituent Assembly definitively rejected political safeguards for religious and other minorities. 12 CAD 299. See Austin 1966 146-56. The Constitution does however provide for nominated representatives of the Anglo-Indian community in the Lok Sabha (Art 331) and in the Legislative Assemblies (Art 333). On the implementation of these provisions, see RCSCST 1975-77: 37.
7 The Constitution contains no similar provision for representation in other political bodies. However, such political safeguards may lie

[illegible] which is apparently broad enough to authorise the reservation of seats in elective bodies on a local level.

8 Election Commission 1976a: 3-6.

9 By separate electorates is meant the representation of religious (or other) minorities by legislators chosen by an electorate composed only of members of that minority. The provision and extent of such representation was an extremely troublesome political issue in India during the forty years preceding Independence. The Government of India Act, 1909, gave separate electorates to Muslims: the Government of India Acts of 1919 and 1935 provided separate electorates for Muslims, Sikhs, Indian Christians, and other groups. Proposals to give separate electorates to the Scheduled Castes under the 1935 Act were withdrawn after adamant resistance by M K Gandhi. See Ambedkar 1946. They were given instead reserved seats in the legislatures — i e, only they could be candidates for these seats, but the whole general electorate chose among the candidates. Separate electorates were a constant focus of dispute between Hindus and Muslims. See Coupland 1944, Dalal 1940.

10 The Supreme Court has indicated that Article 15 prohibits communal electorates in local bodies. *Nain Sukh Das v State of UP* AIR 1953 SC 384.

11 Representation of the People Act. 1951. (Act 43 of 1951). The smaller deposits apply in contesting non-reserved as well as reserved seats. A proposal by Punjabrao Deshmukh, leading spokesman for the Other Backward Classes, to extend the smaller deposits concession to that category elicited a gruff dismissal from Ambedkar, then the Law Minister:

> this is the first time that I hear that such a concession should be extended to the Backward Classes. Hitherto the concessions that have been spoken of as being necessary for the upliftment of the Backward Classes are educational concessions and concessions in the services of the country. .. so far as the Members representing the Backward Classes in this House ... they are capable of paying not only their own election deposits, but also the election deposits of many others.

The government refused to accept the amendment and it was withdrawn. *Parliamentary Debates,* Vol XII-XIII (Part II), cols 9141-49 (May 19, 1951).

12 Article 334.

13 Constitution (Eighth Amendment) Act, 1959.

14 Constitution (Twenty-third Amendment) Act, 1969.

15 Lok Sabha Debates, Fourth Series, Vol XXXIV, No 16, Col 299 (December 8, 1969).

16 In 1952, all of the Scheduled Caste seats and half of the Scheduled Tribe seats in the Lok Sabha were in double-member constituencies. In 1957, 48 out of 471 Scheduled Caste seats in the Vidhan Sabhas and 115 of the 221 seats reserved for Scheduled Tribes were also in *double-member* constituencies. On the functioning of the double-member constituencies and their abolition, see Dushkin 1972: 189 ff.

17 The Two Member Constituency (Abolition) Act, 1961 (Act 1 of 1961).

18 There were also complaints from administrators about the difficulty and expense of counting the ballots in double-member constituencies. Election Commission 1966: 1, 7.

19 In actuality this did not happen very often. In nearly two-hundred double-member constituency contests for Lok Sabha seats in 1952 and 1957, the general seat was won by a reserved seat candidate in one in 1952 and five in 1957. It was apparently even less frequent in the legislative elections, as indicated by the very small number of non-reserved seats occupied by Scheduled Castes and Tribes (See Table 5).

20 In a well-known 1959 decision the Supreme Court upheld the right of a Scheduled Tribe candidate to take the unreserved seat, sealing the defeat of the Labour Minister. *V V Giri v D Sura Dora,* AIR 1959 SC 1318. For adverse comment, see Nigam 1960. Dushkin 1972: 192 says this decision triggered the move for abolition. The Delimitation Commission had taken some pains to avoid double-member constituencies with a minority tribal population. Election Commission 1955: I, 51.

21 In most cases this was done simply by dividing the double-member constituency and allotting the reserved seat to the one with the greatest proportion of Scheduled Castes or Tribes in its population Election Commission 1966: I, 8.

22 Delimitation Act, 1972 (Act 76 of 1972). General information in the following paragraphs is based on an interview with a member of the previous Commission in 1966.

23 *Section 5.* The associated members from each state are consulted after tentative delimitation. After changes at this stage, the proposed delimitations are published and objections invited. Where there are objections, hearings are held. The location of reserved seats is the most frequent source of objections, but they are rarely shifted.

24 Article 329.

25 Section 9 (1) (d).

26 In the following pages, comparisons of the reserved seat holders in the Lok Sabha with the occupants of general seats are based on data made available to me by Henry C Hart of the University of Wisconsin. This data consisted of (1) coded cards on all 497 members of the Third Lok Sabha from 1962-65 and (2) coded cards based on his interviews with 189 members of the Lok Sabha in 1963-64. Of the sample, 108 were a random sample (30 per cent) of Congress members. The remaining 79 were 60 per cent of the opposition and independent members. The sample [illegible] The latter is not random, but is weighted slightly toward those active in the affairs of the Lok Sabha. In the sequel a source given simply as "Hart Data" refers to the larger set of cards on all members; the smaller set is referred to as the "Interview Sample". Other data from the Hart study is presented in Hart 1971.

27 Krishna (1966:28) reports 19.

28 Section 9 (1) (c).

29 My figures are taken from the Hart data. Krishna 1966:28 gives slightly different figures, but the overall picture is not very different.

30 Election Commission 1976: II-A, 265. Inspection of the Election Commission tables reveals that Andhra is not atypical in this regard.

31 Election Commission 1959: I, 57. But for an instance of alleged manipulation in the opposite direction, see Saberwal 1972: 74.

32 Election Commission 1968: I, 12.

33 *Mastanaiah v Delimitation Commissioner,* AIR 1969 AP 1. The Court rejected the argument that the Delimitation Commission was *required* to locate a reserved constituency in an adjoining district with a slightly higher percentage of Scheduled Castes.

34 The Election Commissioner characterised a proposal for rotation (on the ground that no area should be permanently burdened with a reserved seat) as "mere lip service to the principle of reservation" and concluded that the "real purpose of such reservations would be largely defeated if the proposal be adopted". Election Commission 1959: I, 75. In the 1969 debate preceding extension for the third ten year period, an amendment proposing rotation, and supported by a disingenuous plea to afford opportunities for election to Harijans in other localities was negatived without a division of the House. Lok Sabha Debates, Fourth Series, Vol XXXIV, No 17, Cols 361, 379. (December 9, 1969).

35 Of these few victories, a share resulted from the double-member constituency arrangement which obtained in the first two elections. Six of the sixteen unreserved seats (one in 1952, five in 1957) won by Scheduled Caste and Tribe candidates in those two elections were the general seats in double-member constituencies where one seat had been reserved.

36 Article 80.

37 Article 171. It should be noted that in only seven of the larger states is there a second chamber. Article 168.

38 Article 164 (1) provides that the states of Bihar, Madhya Pradesh, and Orissa shall have a minister in charge of tribal welfare who may in addition be in charge of Scheduled Castes and Backward Classes or any other work.

39 RCSCST 1962-63: I, 153.

40 Ministry of Food, etc, 1966: 955, 12ff.

41 RCSCST 1963-64: I, 163.

42 The population figures here are somewhat overstated since Scheduled Castes and Tribes are less

[illegible] than the general population. But offsetting this, the small territorial constituencies ought to give these groups an advantage. Also Bengal is reputed to be less resistant to the mobility of these groups than many other areas.

43 RCSCST 1969-70:51.

44 The percentage of Muslims (who make up about 11 per cent of the population of India) in legislative bodies is small and declining. Muslim membership declined from 7.2 per cent of the Lok Sabha in 1952 to 4.6 per cent in 1971. Gauba 1973:245. Muslim participation in the State Assemblies is at roughly the same level and has been undergoing a similar decline. Gauba 1973: 262-65; Krishna 1967: 187.

45 See Austin 1966: 146ff. On the earlier conflicts about methods of representation for Scheduled Castes, see Ambedkar 1946; Dushkin 1957.

46 My account is drawn from the comparisons of the occupants of reserved and general seats found in Chauhan and Chopra 1969; Dutta 1969; Narayana 1978; Mohopatra 1978. These accounts comport with the profile of Scheduled Caste MPs in Parvathamma and Jangam 1969.

47 Narayana 1978: 1605. Mohopatra 1978:4 shows even higher educational attainments for Scheduled Caste representatives in the Sixth Lok Sabha, but a renewed disparity due to even more degree holding general members.

48 Mohopatra 1978.

49 Mohopatra's (1973) useful study of the Orissa Legislative study in 1969 (n=85 of 139) found that Scheduled Caste and Tribe legislators were younger, less educated, came from more agricultural backgrounds, and fewer of them had independent professions.

50 The data referred to here is that described in note 26 above. The reader should be warned that this data has not been subjected to refined analysis to see, for example, if the differences can be explained by other factors — like political experience or party affiliation. The interview sample (utilised in Tables 15-18) has additional problems of representativeness, but the picture there seems fully consonant with the data drawn from the whole membership.

51 They provide no measure, for example, of the vision or sustained energy whose absence is marked by Saberwal (1972:79) when he notes that the Harijans in the reserved constituency that he studied had

> [illegible] leaders who understood the [illegible] institutional mechanisms [illegible] underlay and renewed the [illegible] inequalities, nor any who [illegible] the stamina for changing the larger system so that its processes would generate effective ... equality.

He does not argue that this absence is produced by the reservation of seats, but such an argument is made in connection with some of the criticism of dependence of reserved seat legislators (discussed below under the heading of "Integrity vs Manipulation").

52 Kochanek (1968:48) found Harijan MPs in 1960 among the strong supporters of land ceilings, urban income ceilings and generally giving "higher than average support for any process of levelling". But *cf* Mohopatra's (1973:22) finding that reserved seat holders *in Orissa displayed* no overwhelming concern for these groups. The pattern in state legislatures may differ sharply from that in the Lok Sabha, as suggested by Dushkin 1972:210.

53 August 8, 1967. See *Journal of Constitutional and Parliamentary Studies*, 1(4):55. See Dushkin 1972:206.

54 Dushkin 1972: 207-8.

55 Galanter 1972.

56 E.g. Krishna (1966:32) notes that in 1962, Scheduled Caste legislators in reserved seats supplied the entire Congress plurality in eight of 13 state legislatures. Dushkin (1972:205) calculated that in March 1967, at least 9 state governments wree dependent on reserved seat legislators.

57 They are, in Saberwal's (1972:78) term, "boosters" that help amplify other modes of upward mobility.

58 Aggarwal and Ashraf 1976:144.

59 There is some evidence that the mobile minority that utilise educational benefits and job reservations is not evenly spread among the Scheduled Castes and Tribes, and it is possible that a similar clustering is found in the enjoyment of benefits directly tied to political reservations. In all these cases, the question is how much spillover is there from the direct recipients to others in the beneficiary groups.

60 *Cf* Dushkin's (1972: 211) observations that Scheduled Caste legislators:

> tend to concentrate their efforts on those items of the protective discrimination system that are of most concern to their more prosperous caste constituents, more ministries for themselves, more scholarships and reservations in higher educational institutions, and above all, more government jobs.

61 Lok Sabha Debates, Fourth Series, Vol XXXIV, Col 299 (December 8, 1969).

62 Dushkin 1972:213.

63 Dushkin 1978.

64 Saberwal 1972:80.

65 Aggarwal and Ashraf 1976: 145. Anant 1972:97.

66 Anant's useful 1968 study of three north Indian localities reveals a consistent pattern of sharp division over preferential treatment, with urban, higher caste and more educated respondents being most opposed. Harijans were the only caste group who favoured extension of reserved seats upon their expiration in 1970. (Anant 1972:97).

67 Weiner and Field 1975:89 ff observe that the lower turnout in constituencies reserved for Scheduled Tribes represents both lower voting rates among tribals and reluctance of non-tribal voters to vote for [illegible]

68 Other [illegible] luctance to have Scheduled Caste representatives is provided by Dushkin (1972:191), who calculates that in the 1957 elections in double-member constituencies, Scheduled Caste candidates came in first in only 34.2 per cent of the Lok Sabha contests and 28.5 per cent of the Legislative Assembly contests.

69 On the basis of his field observations Saberwal (1972:77) argues that reserved seats help weaken ideas concerning the low social status of Scheduled Castes, their general lack of competence and their inherited pollution.

70 Joshi 1978.

71 Brass 1966:105.

72 Narayan 1974:217. Instances of this pattern are described by Lynch (1969:101) and Gupta (1971).

73 But *cf* Hart (1971:134-35) who observes that India has erected a system of "co-optative representation like that which merged the Scottish into the British elite" and surmise that "to keep these voters docile ... any government will have to maintain, even accelerate, the employment of these subject peoples in government".

74 Zelliott 1969:279.

75 Lynch (1969: 107ff) describes the division within the Republican Party on this issue. But *cf* the overwhelmingly supportive views reported by Anant 1972-97 and Aggarwal and Ashraf 1976: 143ff.

76 On the basis of her case study Gupta (1971:1886) concludes that "reserved constituencies tend to intensify caste tensions among ... [the groups] for whose benefit the reservation ... has been provided... "

77 An interesting portrait of Scheduled Caste political activity in a general constituency may be found in Dua (1971). Revealing glimpses of Scheduled Castes offering electoral support for tangible collective benefits may be found in reports of election disputes. For example, *Tirlochan Singh v Karnail Singh*, AIR 1968 P and H 416 (promise of Rs 1,500 to construct a Harijan dharamsala); *Balwant Rai Tayal v Bishan Saroop*, 17 ELR 101 (Punjab High Court, 1958) (promise to help Harijans retain temple site and get land for building houses); *Magan Lal Bagdi v Hari Vishnu Kamat*, AIR 1960 MP 362 (promise to dig well for Harijans).

78 Bhatt (1975) analyses a sample of 1757 male Hindus in 100 rural and 20 urban localities in 4 states (Andhra Pradesh, Gujarat, Uttar Pradesh, West Bengal).

79 Bhatt 1975:79, 82, 84, 98.

80 Bhatt 1975:87-92.

81 Bhatt 1975:104-107.

82 Bhatt 1975:112 ff, 150.

83 Eldersveld and Ahmed 1978:109, 198.

84 Eldersveld and Ahmed 1978:197.

85 Bhatt 1975: Chap IV.

86 Bhatt 1975:179 ff.

87 *Cf* Gupta's (1971:1884) description of the "general resentment among the higher caste Hindus against Sasni being part of a 'reserved' constituency". The feeling

that [illegible]
presen[illegible]
represent[illegible] was echoed [illegible] distinction drawn by an (early) Election Tribunal in *B R Ambedkar v S A Dange*, 1 ELR 364 (Election Tribunal, Bombay, 1952). Urging voters to give both of their votes to a single candidate to avoid Scheduled Castes being elected to both seats in a two-member constituency was not, found the tribunal, the systematic appeal on ground of caste forbidden by the election law since

> the emphasis was not on the undesirability of both the seats going to the Scheduled Castes but on the possibility that as a result of the reservation, voters other than the Scheduled Caste voters might go unrepresented.

88 In their study of Indian political participation, Eldersveld and Ahmed (1978: 205) report that

> the overwhelming majority of .., activists are politically conscious of caste. They know how the caste leader voted. Among upper castes the ratio is 6 to 1 that activists are aware of caste, in the middle castes it is better than 8 to 1, and for the lower castes and Harijans it is 3 to 1 that activists are caste conscious.

89 Thus Santhanam (1964: 13), for example, speculates that reserved seats for Scheduled Castes provided moral legitimation for caste politics.

90 Eldersveld and Ahmed 1978: 205.

Great Nationalism, Little Nationalism and Problem of Integration

A Tentative View

Amalendu Guha

Spatial political behaviour and problems of integration in Northeast India have to be understood in their specific historical context. The present short paper is an attempt at focusing on this context.

Part I of the paper traces the growth of nationalism in India in general and Part II examines its specifics in Northeast India, with a view to explaining the political behaviour pattern as observed in that region.

I

A NATIONALITY is a stable community of culture, historically evolved within a definite territory, on the basis of common economic ties and language and, also often with one or more other such common factors. A nationality so defined, had, in some cases, its rudimentary beginnings in consolidated feudal monarchies. But its further developments, and even its beginnings in most cases, were integrally linked with the rise of capitalism.

In Europe, the rising capitalist classes found it convenient to emphasise the separate cultural identities of their respective regions so that feudalism could be pulled down by national democratic movements, and their own class interests could be projected apparently as wider national interests, through newly formed bourgeois states. Each of these capitalist classes posed itself as the exclusive spokesman for all members of the regional-cultural formation, i e, the nationality it belonged to. This is how nationalism was born as a spiritual sentiment, shared in common by members of the concerned nationality. It was also a movement with a definite ideology and programme. Basically anti-feudal in character, such national movements tended to culminate into the establishment of bourgeois democratic states so that there could be unhindered development of capitalism on the basis of widened and protected national markets.

It was through British colonialisation that the ground for similar national movements was prepared in India and, for that matter, also in its northeast region. In the absence of a capitalist class base, the emergence of nationalism before that was not possible. British rule unified disjointed and remote parts of the country through a centralised system of administration as well as a network of railways and communications it built during the late 19th century. The purpose was to bring India into the orbit of world capitalism so that exploitation could be intensified.

Consequent upon these profound changes, new middle classes, oriented to capitalism, were found operating amongst India's varied linguistic communities at sub-regional, regional and all-India levels. These middle classes were objectively opposed to foreign domination over the home market. Hence, they looked forward to establishing their own domination instead, so that indigenous capitalism could thrive thereby. Protection of home market against foreign competition emerged as a slogan. To promote their own interests, these classes rallied popular support behind them, by exploiting spiritual sentiments based on a community of culture. This happened both at the regional and the all-India levels. Alongside of Indian nationalism one often heard of Bengali or Marathi or Assamese nationalism as well. These nationalisms sustained — and were in turn sustained by — Indian peoples' common struggle against British rule. The latter was increasingly identified as the main obstacle on the way of further growth of the Indian class society.

All parts of India and all Indian nationalities did not come under British rule at one and the same point of time. Nor were they at the same stage of socio-economic development when they did. Moreover, even the degree of British centralised control was not the same all over India — some were definitely under-administered as compared to others. This unevenness was bound to leave its imprint on the manifestation of nationalism at the various levels, both in terms of chronology and in terms of the emotional content and identity.

It was broadly along two tracks that Indian nationalism was developing from its very beginnings in the mid-19th century — (i) great nationalism on an all-India plane and (ii) little nationalism on a linguistic-regional plane. Great nationalism emerged as the ideology of the nascent pan-Indian big bourgeoisie who wanted an appropriate share of the growing India-wide home market for themselves to the exclusion of (or in collaboration with) foreign capitalists. They also wanted an independent unitary state to secure it. This was acceptable also to large sections of the professional middle classes of certain advanced regions like coastal Bombay and Bengal. For they were confident of seizing a large share of all the professional and other opportunities to come up in such an India-wide competitive market, because of their early initiation to English education and administration. The Indian National Congress represented great nationalism, in its original undiluted form, during the years 1885-1917.

Little nationalism, on the other hand, emerged as the ideology of the region-based small bourgeoisie (i e, the regional middle classes) who feared competition from middle classes of other regions as well as from the pan-Indian big bourgeoisie. Little nationalism, therefore, stood for an exclusive control of the regional markets by their respective middle classes.

The concept of a unitary national state was not a suitable ideal for little nationalism. It looked forward to a multi-national state with a federal set-up that would guarantee substantial regional autonomy to each national identity. In its extreme and late form (in exceptional cases) little nationalism stood, alternatively, even for secession, or dual citizenship and sovereign political status.

How were great and little nationalisms inter-related? In the course of their historical evolution, they in general moved in unison, continually tending to merge with each other; but on occasions, they also tended to clash

headlong against each other in opposite directions. On the whole, during the period of our anti-imperialist struggles, they moved in the same direction, and overlapped with each other. They thus got intertwined. Indian national movement since 1917 involved a series of compromises between great and little nationalisms so that all nationalist forces could be consolidated to achieve the common objective. Gandhi with his concept of linguistic provinces ushered in this process. The dominant class view on the national question, as a result, underwent substantial changes, in favour of and towards recognition of multi-national interests, both before and after our Independence.

It was in this process, as worked out above, that castes, tribes and local communities were being absorbed into larger entities along either of the two above-mentioned tracks. The little nationalities, too, were imperceptibly getting integrated with a still larger national entity — the Indian nationhood in the making.

In the Indian context, there was and is also a growing understanding that only by eliminating bourgeois distortions could a basis for true nationalism be found — also that one's loyalty to regional culture is quite compatible with true nationalism and internationalism, once class exploitation is removed from the scene.

II

For economy in administration, the British rulers organised the conquered northeastern territories into a multilingual, composite province. Only Bengali of all languages of the province had some official recognition for limited purposes during the years 1837-73. It was with this background that Assamese little nationalism had its beginnings, alongside of great nationalism. Throughout the 19th century, regional and all-India consciousness co-existed peacefully all over the plains of Northeast India. In the hills areas, however, nationalism — great or little — was conspicuously absent during the century. There it is a 20th century phenomenon, associated with the rise of local, educated middle classes during the inter-war and World War II period.

The people of the plains of Assam were associated with a provincial legislature since 1906; and the people of the partially excluded hills areas, i e, the Khasi, Garo and Mikir Hills, since 1937. However, in the latter case, the degree of political participation was perfunctory. Nagaland, Mizoram, Arcnachal (Nefa) and the N C Hills were totally excluded from any kind of constitutional reforms until 1947. This uneven constitutional and administrative development, as much as the uneven economic progress, also contributed to the belatedness of nationalism in the northeastern Indian society. Different segments of it came under the spell of nationalism at different times. Another point to note is that great nationalism had only marginal impact on the hills peoples; and the least or little impact on Nagaland and Mizoram, in particular. There are geographical and historical reasons for that.

The Khasi (and Pnar) people were found already organised into rudimentary state formations, when they came under the British. Conscious of their local privileges, the Khasi chiefs began organising themselves into voluntary associations since 1900. This factor and the location of the provincial capital in Shillong since 1874 largely accounted for the early politicisation of the Khasis, relatively to other hills people. It was only during World War II that the Garos, the Mizos and the Nagas had their first nationality-wide political organisations formed. This process of politicisation was essentially linked with little nationalism.

The formation of an educated, Christian middle class helped the process. In 1901 there were only 26 Christians in Mizoram. By 1951, they constituted 90 per cent of the Mizoram population. Similar progress of Christianity, though not equally spectacular, was there in other hills areas as well. In the matter of literacy, too, the level achieved in the hills compared favourably with the all-India average. In some cases, it was even much higher, as in Mizoram where the male literacy rate was 46.2 per cent and female literacy rate 16.7 per cent in 1951. Christianity contributed not only to the literacy movement, but also to the development of tribal dialects as written languages in Roman script.

Thus, the language became *inter-alia* a unifying and modernising factor in the hills, finally leading to the growth of hills nationalities and their little nationalisms. In Mizoram, from the very beginning, Mizo nationalism had an anti-feudal content. It was directed primarily against the autocratic chiefs. This anti-feudal content is present, to a lesser extent, in the national movements of other hills districts as well, depending upon the degree of autocracy their chiefs exhibited. The basic content of the little nationalisms of the hills areas however was and still is *anti-tribal*, in the sense that it stands for the transformation of a tribe or a group of tribes, within a well-defined territory, into a distinct nationality. Tribes, like castes, are expected to get dissolved in that process to make room for nationalism, in the same way as little nationalities in the Indian context are expected to get dissolved to make room for an all-India nationalism.

In our view, great nationalism and little nationalism are compatible, but not necessarily and always within a class society. The middle class of a late-developing, small nationality is necessarily weak. This explains why the growing middle classes of the hills areas were less involved in the modern phase of the anti-imperialist struggles than their counterparts in the plains. These very middle classes, after independence, were nevertheless able to force changes into the Indian constitution to create new autonomous national states within the Indian Union. However, the lopsidedness of the economic development, in the interests of the Indian monopoly houses, poses a new danger — that of these little autonomous segments being swamped by floods of immigration. To avoid this, Northeast India needs a different pattern of economic development, with emphasis on maximum utilisation of local manpower, even if that means slowing down of the pace of modern development in the conventional sense. Otherwise, little nationalism will probably take the Naga-Mizo path to separatism.

There is no administrative or military short-cut to achievement of nationhood. Indian nationalism and the associated process of state formations are still in the making. Today the only way to de-emphasise the tribal exclusiveness as well as differences in religion, castes and ethnicity is to realise the importance of cohesion of respective regional communities. In the very process of this being achieved, regional communities will also feel to be themselves parts of the bigger Indian societies. Meanwhile the Centre-state relations need a thorough reshuffling to make such voluntary emotional integration possible.

To conclude, India is a multi-national state which is not dominated by any particular nationality. No single

nationality has an absolute majority in India, so far as the numerical strength is concerned. No single nationality dominates all facets of power and influence either. Besides, all the nationalities developed a historic sense of unity in course of their common struggles against the British rule, and they were found keen to retain this sense of unity even after Independence. In the process of economic transition, hundreds and thousands of workers from different linguistic groups became intermingled. The Indian working class, therefore, stands as much above parochial little nationalism as above aggressive great nationalism. In its conception, true nationalism can absorb what is good in little nationalism and stands also for internationalism. It stands for Indian unity within the multinational state of India. It looks forward to a United India organised on the basis of (i) the recognition of Indian multinationality, (ii) federal principles of state organisation with single citizenship and (iii) protection of the democratic rights of all national minorities and their languages all over India, including the right of self-determination.

[An earlier draft on this paper was presented at a Seminar held at Shillong, under the auspices of the North East Hills University on 1 Sept-2 Oct 1978.]

Railway Finances

A GENERAL examination of the financial position of Indian Railways by the Rail Tariff Enquiry Committee has come to the conclusion that "the financial position of the Railways has been satisfactory".

At present the railways are required to pay dividend at 5.5 per cent on capital invested upto March 1964 and ... cent on fresh investment there- ... In the Draft Sixth Plan, the ... Commission has suggested ... "return from investment in ... and state enterprises should ... by economies and price ... to a post-tax level ... 10 per cent". Actually, ... have not been able to meet ... obligations even under the ... Convention. The working of ... Railways has resulted in a deficit, ... payment of dividend, almost continuously since 1966 67. Consequently, the Railways have had to take loans from the General Revenues to meet the dividend liability when the net revenue was not sufficient for the purpose (Rs 309 crores) and to meet the expenditure on development works which are required to be financed from surplus revenues (Rs 153 crores). The temporary borrowings on this account outstanding at the end of 1976-77 amounted to Rs 463 crores. Further, these deficits have been incurred in spite of the fact that the provision made for depreciation has not been adequate resulting in considerable arrears in renewals and replacements, and the provision made for pensionary liability has also been less than warranted.

The Rail Tariff Committee is of the view that, among other factors, the fact that the increase in the fares and freight charges have not kept pace with increase in the price levels is mainly responsible for the unhealthy financial position of the Railways. In this connection, it has been brought out that, during the period 1950-51 to 1976-77, while the average cost per Railway employee has increased by 400 per cent, the price of coal by 370 per cent and that of mineral oils by 443 per cent, the average earnings per passenger kilometre and per tinne kilometre of goods have increased only by 134 per cent and 180 per cent, respectively.

[illegible]
A Case Study of the Chaudhri Tribe

Ghanshyam Shah

To understand the complex relationships between caste and class, it is necessary to go beyound mere socio-economic hierarchy.

Two questions are pertinent in this context. First, what are the economic differentiations within a caste, and how do they cut across the castes both vertically and horizontally? Secondly, to what extent does the ritual status of a caste and a sense of fraternity among the caste members blurs economic differentiations, and sustains a false consciousness?

The present paper, based on observations of a single tribe in Gujarat, endeavours to answer these questions with the help of empirical data.

I
Introduction

THANKS to the ritual hierarchical order of the caste system, several scholars have categorised castes in terms of upper and lower as equivalent to class divisions. It is assumed by many — and demonstrated by a few studies — that upper castes not only hold higher ritual status but also higher economic status in terms of occupation and income. Lower castes on the other hand are poor. Significant correlation between caste and class hierarchy exists.[1] Such analysis is important so far as it goes. But, essentially these studies remain studies on caste rather than caste-class relationships. They do not lead us beyond 'socio-economic hierarchy', which tells us about economic conditions of different castes. Relationship among the classes cutting across castes has hardly been discussed; instead, what is discussed is ritual relationship. They overlook the fact that all the members belonging to a particular caste do not enjoy equal economic status; in other words, castes are not homogeneous from an economic point of view. Economic differentiations within most of the castes — high as well as middle and low — exist, or have been developing during the last two decades.[2] Intra-caste economic differentiations vary from caste to caste.[3] Even studies of single castes do not pay sufficient attention to this aspect.[4]

For a meaningful understanding of the complexity of relationships between caste and class, it is necessary to go beyond mere socio-economic hierarchy. Two questions are pertinent in this context. First, what are the economic differentiations within a caste and how they cut across various castes both vertically and horizontally? Second, to what extent ritual status of caste and a sense of fraternity among caste members blurs economic differentiations, or to use a popular phrase, sustains false consciousness? This paper is an endeavour to explore these questions with the help of empirical data. However, the unit of our observation is a tribe and not caste.

The difference between tribe and caste is marginal. As Kosambi observed, "the entire course of Indian history shows tribal elements being fused into a general society".[5] Herbert H Risley, the Commissioner of the 1901 Census also wrote: "All over India at the present moment tribes are gradually and insensibly being transformed into castes". The process of the shift of tribal people into the caste system by adopting caste rituals, norms and customs, has accelerated during the last few decades.[6] Hence, whatever the differences there might have initially been between the two are now getting blurred.[7]

While discussing the tribe (caste) — class issues two factors which influence the overall relationship need to be mentioned at the outset. One, India follows the path of capitalist economy, and competitive polity. Capitalist economy develops differentiations in society on class lines, and competitive polity compels politicians to widen their support structure across the narrow boundaries of kinship and caste. Secondly, political ideology and practice ignore the growing economic differentiations within and between tribes. All the tribes are clustered into one group described as scheduled tribes by the Indian constitution. This practice ignores differentiations among tribes, and also legitimises a tribe as tribe with distinct social and cultural identity. Social workers and administrators working among tribals treat tribals as economically homogeneous groups and carry out the programmes for tribal development accordingly. Political parties address tribals as one undifferentiated group. This is true of communist parties too. Furthermore, studies on tribals by social scientists also treat them as one homogeneous egalitarian group. They have used the concepts like 'tribal culture', 'tribal economy' etc. How these factors — capitalist economy and political ideology and practice — operate and influence tribal society is the subject of the present exercise which is confined to one tribe in Gujarat.

II
Economic Differentiations

Scheduled tribes constitute 14 per cent of the total population of Gujarat. The major tribes in the state are: Bhil, Dhodia, Gamit, Varli, Dubla, Kotwaliya, Chaudhri and Rathwa. Some of the tribes like the Dubla and the Rathwa are economically very poor and educationally backward. They are mainly landless labourers. There is 6 per cent literacy among Rathwas. On the other hand, Dhodias and Chaudhris are economically advanced. Literacy among the Dhodia is 31 per cent.

The Chaudhri tribe is mainly found in Surat district, South Gujarat. In 1971, its population was 188,273. Almost all of them are found in villages. Chaudhris can be divided into four economic strata on the basis of occupation and ownership of land. These are: (1) Agricultural labourers and poor cultivators; (2) Middle cultivators, (3) Rich cultivators and (4) White-collar employees. The first three strata constitute more than 92 per cent of the Chaudhri working population. The white-collar employees are less than 3 per cent.[8]

Labourers and Poor Cultivators

Labourers and poor cultivators are at the bottom of the occupational hierarchy. It is the single largest stratum, constituting 61 per cent of the

...tivators, of which 24 per cent are almost landless and 37 per cent have land between one and five acres. Their main source of livelihood is manual labour. The cultivators falling in this category do not have enough infrastructural facilities to make their land economically viable. Their soil is rocky and barren. Most of them do not have a pair of bullocks or even a well, let alone an electric or diesel pump for irrigation (Table 1). 41 per cent use chemical fertilisers, whenever they are available at subsidised price from the government. Often they do not get it in time and they do not have enough money to buy it in the open market. In this situation, their lands produce very little. Whatever they produce is barely enough for their own needs. They hardly employ labourers. During the harvest season, they help each other by way of mutual exchange of labour. They work on their as well as on other cultivators' farms on daily wages. Those who do not have land work as manual labourers. A labourer gets anything between one and three rupees per day, depending upon the nature of the work and availability of labour. Labourers do not get work on the farms all round the year. During the off season, they and poor cultivators take up wood cutting or road construction work, or migrate to nearby towns in search of manual work. Or else, they starve, or eat certain edible roots to mitigate their hunger.

MIDDLE AND RICH CULTIVATORS

38 per cent of the Chaudhri cultivators own land between five and fifteen acres. They may be classified as middle cultivators. 20 per cent of them have wells on their farms for irrigation, and half of them have diesel or electric pumps. A majority of them use chemical fertilisers. On an average each household of the middle cultivators has 1.7 bullocks; or, to put it differently, 70 per cent of the households have a pair of bullocks. They produce surplus to sell in the market if they ... infrastructural facilities.

... cultivators who own more than fifteen acres of land are at the apex of the economic ladder. They constitute ... per cent of the Chaudhri population. ... of them have irrigation facilities, and 25 per cent have an electric or diesel pumpset. They use chemical fertilisers. On an average, they own 2.8 bullocks. (Table 1).

... and rich cultivators employ ... during the harvest season. ... ers of their families work on their own farms but they rarely work as wage-earners on others' farms. The few rich cultivators grow more than one crop on their irrigated land and the members of their families, particularly *women and children and educated* boys and girls, do not work even on their own farms. They employ tribal labourers.

Earlier, middle and rich Chaudhri cultivators were not producing any marketable surplus. They were in the clutches of non-tribal money-lenders who were also absentee landlords. Their condition has however changed, thanks to certain progressive land legislations and to the spread of infrastructural facilities such as irrigation, roads etc. They have changed their cropping pattern. With the availability of irrigated water and the use of fertilisers and improved seeds, they produce cash crops, and a surplus of food crops for sale. Those who can take advantage of the irrigation facility prefer to cultivate Kolam IR 22 paddy, because it gives a higher yield, and this means more money, though for personal consumption they either buy low quality paddy from the market, or cultivate it in a small area.

They are no longer ignorant of price fluctuations in the market. They try to sell their products at a competitive price. An Adivasi who owned about 16 acres of land energised by a pumpset, said, "Our village is on the road and connected with Unai, Buhari, Valod and Vyara (all taluka business centres). We enquire at all the places and sell at the place where we get the best price. We get agood price for groundnut at the Vyara Co-operative Ginning Factory. Baniyas do not give such a good price, so we sell it to the co-operative society." Some of the prosperous cultivators have now started lending money on interest at as high a rate as 144 per cent, to poor tribals. Also, they purchase land from fellow tribals or take their land on mortgage.

* This excludes labourers.
** Percentages in all cases are calculated from the total (N) in respective stratum

WHITE-COLLAR EMPLOYEES

About 3 per cent of the Chaudhris are engaged in white-collar jobs. The first non-agricultural white-collar job that the Chaudhris got was teaching in primary schools. It may be mentioned that Sayajirao Gaekwad III of Baroda started a school in Songadh in 1885. A few of those who were trained in this school became teachers in other schools started by the Gaekwad and later by the British government. After the twenties, some Chaudhris were trained to become teachers under Gandhian education schemes. The process has continued. About 50 per cent of the primary school teachers in Surat district, according to one survey, were Adivasis between 1947 and 1967. The Chaudhris topped the list among the Adivasis. Out of 1643 scheduled tribe teachers in the district, 739 (44 per cent) were Chaudhris.[9]

Some others are clerks, postmen, talatis, gramsevaks, extension officers, etc, in government departments. A few are secretaries, accountants or clerks in co-operative societies or such other organisations. Such office jobs require formal education. Earlier, one could be a primary school teacher with a vernacular 7th standard certificate, but now an aspirant for such a job has to have passed the SSC with 55 per cent marks. Similarly, 10 years ago, one with 4th standard education could get the job of a peon in a government office. But now, the minimum qualification required is 7th standard. In this sense, the office-goers are educated.

Middle and rich cultivators dominate the stratum of educated white-collar employees. 16 per cent and 12 per cent of rich and middle cultivators, as against only 7 per cent of poor cultivators' households have someone serving in government or semi-government offices. The lower positions in government offices are occupied by Chaudhris coming from poor culti-

vators' households, whereas higher positions are occupied by the persons coming from middle and rich cultivators' households.

White-collar employees who earn regular salaries save some amount from the salary and send a part of it to their families in the village. A few of them invest their savings in developing agriculture. Moreover, thanks to their exposure and contact with non-Adivasis, they grab opportunities offered to them by different government agencies. They also look after agriculture. From their savings, a few of them purchase land from fellow Adivasis. Some lend money to the needy villagers on interest. Their rate of interest is as high as that of the non-Adivasi moneylenders.

III

Fission in Social and Religious Life

The Chaudhris are divided into five endogamous groups: Nana, Mota, Valvai, Tekaria and Bonda. Nana and Mota Chaudhris form the largest groups in terms of numbers. The Chaudhris are further divided cutting across endogamy, into *Varjela,* those who have renounced traditional customs and the *Sarjela,* destined 'to suffer and be exploited'. These divisions began with the Gandhian social reform activities in the twenties. The Gandhians adopted the approach of Hindu reformists, who believed in maintaining a flexible structure, in giving up expensive social customs and introducing simplicity in marriage and such other rites, emphasising vegetarianism and teetotalism. This coincided with the influence of *Bhakti* movement. Divisions between Varjelas and Sarjelas within each endogamous group have become very sharp recently. The Varjelas look down upon Sarjelas and avoid social relations with them. They prefer marriage of their children with Varjelas. One of the Varjelas, a Gandhian activist, told us that "in the near future, we Chaudhris will never bother about the sub-groups such as Nana or Mota, but there are going to be two distinct major groups, that is, Varjelas and Sarjelas". This opinion is indicative of the new social divisions that are emerging among the Chaudhris. It may be added that the Varjelas largely come from the strata of middle and rich cultivators and the white-collar employees.

Though some of the traditional marriage and other customs have continued, white-collar employees and the Varjela rich and middle cultivators follow certain Hindu customs. They invite Brahmin priests to perform marriage ceremonies. Instead of playing *dobru,* the indigenous traditional musical instrument, they have devotional choral groups singing hymns or a brass band playing Hindi film tunes. The *dobru* is condemned because according to them the tunes played by it are obscene and sexy. Further, instead of oral and symbolic invitation called *punj mukavi,* they send printed invitations. Interestingly enough, though the poor Chaudhris do not follow these 'new' customs, they do not disapprove of them either. 81 per cent of the poor Chaudhris felt that reforms in the marriage rites and other social changes followed by a few were good and desirable. They do not adopt them partly because they cannot afford them and partly because they find it difficult psychologically to change over to the new customs. But they consider that the new customs do add to the prestige of the family. Thus, values and norms of upper caste and class — Brahmins, Baniyas and Patidars — of the larger society are increasingly being adopted by the white-collar workers as well as the middle and rich Chaudhri cultivators.

In the religious sphere, Chaudhris worship various gods. Ahindo dev, the god of the hills, Himario dev, protector of fields, Kansari mata, the goddess of corn, Kaka Balia and Shilimata, the god and goddess of chickenpox and smallpox respectively, Vag dev (tiger), Nag dev (snake), etc, are some of their important gods. Some of the Hindu gods and goddesses have entered the Chaudhris' religious life. It is difficult to draw a line between 'Adivasi' and 'Hindu' gods. Some deities like Kaka Balia or Nag dev have been common for many decades. What is significant, however, is that some Chaudhris now mainly worship Ram, Krishna or such other Hindu gods, and they rarely pay a visit to the shrine of the traditional Adivasi gods. Stratumwise the differentiation is reflected in their religious beliefs. White-collar employees are prone to Hindu gods or they do not visit any temple, and a large number of the poor Chaudhris still worship traditional Adivasi gods (Table 2). 64 per cent of the poor as against 5 per cent of the white-collar employees and 40 per cent of the rich Chaudhris worship only traditional Adivasi gods.

There is a striking difference in the life-style of different strata. An educated office-going Chaudhri dresses himself in a manner which is similar to that of other non-tribal office-goers.

Table 4: Household Items

(Percentages)

Household Items	Labourers and Poor Cultivators	Middle Cultivators	Rich Cultivators
Stainless steel utensils	10	27	48
Furniture	12	30	55
Watch	9	21	42
Radio	4	10	28
Stove	3	6	17
Total N	2039	1098	165

Varjela rich and middle cultivators are closer to non-tribals in their dress than the poor Chaudhris. Their food habits are also undergoing changes. Generally, jowar and dal are used in their daily diet by all Chaudhris. Wheat is not regularly consumed by the poor. But 43 per cent of the white-collar Chaudhris consume wheat almost daily. Rice is also an important cereal used by Chaudhris. But since rice is costlier than other cereals, only 9 per cent of poor Chaudhris as against 38 per cent and 74 per cent of rich and white-collar Chaudhris respectively consume rice regularly. Poor cultivators and labourers do not consume milk regularly — not even with tea. Ghee is rarely used except by the white-collar employees. But edible oil is used by many. However, the frequency of its use varies from stratum to stratum; only 39 per cent of the poor Chaudhris as against 83 per cent and 93 per cent rich and white-collar Chaudhris use edible oil most of the times. Except for the poor, the majority of the rich and middle cultivators and white-collar employees use sugar regularly. However, in the case of meat and eggs the order is reversed. 45 per cent of the white-collar as well as rich Chaudhris are vegetarians, thanks to the influence of Gandhian and *Bhakti* movements. Their number is small in the case of the poor and middle cultivators (Table 3).

Further, the Chaudhris of the different strata own different household articles. Though most of the Chaudhri households do not have a piece of furniture like a chair, a table or a bench, otherwise the difference is sharp. Only 12 per cent of the poor as against 55 per cent of the rich Chaudhris have furniture. Or take the case of stoves. Only 3 per cent of the poor as against 17 per cent of the rich Chaudhri households possess stoves. A similar pattern is found in other household items (Table 4). Data about white-collar employees' households are not available, but it can be safely said that most of them have all these items.

Thus, the Chaudhris as a social and religious group are losing their identity. Their so-called pristine 'tribal' social and religious beliefs and life style are disintegrating. The differentiations among the different strata are becoming sharp. The labourers and poor cultivators are following the traditional life-style, social customs and religious rituals. On the other hand the rich and educated Chaudhris follow social and religious life-styles of the middle and upper classes and castes of the non-tribal society.

IV

Vocal Section

Middle cultivators and educated white-collar employees constitute a vocal section of the Chaudhri tribe. They are politically more active than the poor and rich cultivators. About 20 per cent of the middle cultivators and white-collar employees, as against 12 and 9 per cent of the rich and poor cultivators respectively, take some interest in politics. A similar pattern is also found regarding attendance at public meetings and participation in processions. While 54 and 40 per cent of white-collar employees and middle cultivators attended public meetings, in the case of poor and rich Chaudhri cultivators, such attendance was confined to only 29 and 25 per cent of them respectively. Similarly, a majority of the poor Chaudhris (52 per cent) have not yet visited any taluka office. Among those who visited, there were those who needed the help of others — an educated person or a village leader — to approach an official. Only 9 per cent of them visited the taluka office alone. The middle cultivators are the largest in number (74 per cent) who have visited taluka office either alone or with some one else.

The members of the middle cultivators and white-collar employees occupy various positions in government and political organisations. One of them was a member of Parliament between 1971 and 1977. He is now the Chairman of the Tribal Development Corporation, Gujarat. Another was a minister in Gujarat government for two years. He is now the secretary of the district Congress (I). Still another is the president of the District Panchayat. Besides them, half a dozen other Chaudhris occupy important positions in different political parties and district level organisations. They are graduates, largely coming from middle cultivator families. They were or they still are government servants or professionals like engineers or pleaders.

What are the problems of the Adivasis that are uppermost in the mind of this section? Do they give voice to the problems of the majority of the Adivasis? In order to know their perception of the problems of the community, we asked them the question: "According to you, what are the problems of your community?" This question was addressed to the members of all the sections. Most of the Poor Chaudhris have reported the following problems:

- We do not have sufficient bullocks, if some have they do not have fodder to feed them.
- Money-lenders do not lend us money and co-operative societies do not assist us when we are in need.
- We do not get work throughout the year; wages are too low.
- There is no food, not enough clothes.
- Agricultural implements are not sufficient.

The Middle and rich cultivators have these complaints:

- Government has increased land revenue.
- Government collects levy.
- There is the problem of good roads
- State Transport system is not adequate.
- There is no electricity in our villages.
- Canal water for irrigation is not available.
- Enough loans from banks are not forthcoming.
- We have to go a long distance to buy clothes, kerosene, diesel, etc.
- The educated are not getting jobs.
- Scholarship for higher studies is not adequate.

White-collar employees reported the following problems:

- Canal water is not available.
- There are the problems of electricity ... Roads ... and Transport.
- People are lazy and they waste their energy in drinking.
- Jobs are not available.
- There is discrimination against us. Our people are not given jobs.

The above responses show quite clearly that poor and better-off Chaudhris perceive the problems of their community differently. They perceive the problems of their stratum to be the problems of their tribal society. Moreover, as far as the perception of the problems is concerned, there is no difference between the middle and rich cultivators. We have, therefore, combined them into a single category. Not only that; the educated white-collar employees also share common problems

TABLE 5: ASSISTANCE FROM GOVERNMENT

(Percentages)

	Labourers and Poor Cultivators	Middle Cultivators	Rich Cultivators	White-Collar Employees
No help	30	18	12	5
One assistance	22	16	21	24
Two assistance	16	24	26	24
Three assistance	6	12	10	24
More than three assistance	—	4	12	22
'Do not know'	25	26	19	2
Total N	67	50	43	42

with middle and rich cultivators. This is obvious as the white-collar employees come from middle and rich cultivator households. They, therefore, talk about irrigation, transport and marketing facilities, about educated unemployment and inadequate quota of scholarship to tribal boys. In social and cultural matters also, these three strata together feel closer to each other. They may be called better-off tribals.

The better-off tribals also obtain larger chunks of benefits provided by the government. This is evident from Table 5, which reports the answers to the question: "What benefits have you received from the government?" The Table shows that quite a large number of respondents fall in the 'do not know' category. This is probably because they do not know whether the government had given them any assistance. Since they do not know anything about government's assistance, we can assume that they have not received any assistance. Stratumwise the break-up of responses leads us to the conclusion that the poor Chaudhris who constitute 61 per cent of the population are deprived of the government benefits the most. 30 per cent of them are still untouched by any government assistance. If we include 'do not know' answers, the percentage rises to 55. The white-collar employees, though a small section, have benefited the most, compared with other sections of the community. For education, they have received scholarship and other assistance. And because of education, they are in the know of government schemes. They pursue their cases and get things done. Besides, a larger number of rich cultivators not only got benefits but they also obtained more benefits than the middle cultivator Chaudhris. This is significant in view of the fact that though many rich cultivators do not hold a political position, they are not deprived of benefits. In other words, middle cultivators and white-collar employee Chaudhris do not hesitate to serve the interests of the rich. So far, there is no clash of interests between the rich and the middle cultivators, or the rich and the white-collar employees.

All the three together, that is, the better-off Chaudhris, join with other better-off Adivasis belonging to different tribes. They have developed a certain commonness, cutting across tribal boundaries, in social and cultural matters and in life-styles. They participate together in government and non-government organisations. They aspire for certain positions. They want to use and control resources.

But the divisible and undivisible resources in society are limited, and the number of contenders among Adivasis has increased recently. This creates competition among themselves. In such a situation, the competitors get divided on tribe lines such as Chaudhri, Dhodia, Bhil and so on. The Chaudhri leaders blame the Dhodias for taking under advantages and *vice versa*. For instance, when one Chaudhri became a president of the Surat district panchayat, vocal sections of the Gamit tribe protested that Gamits were neglected. Sometimes in the assembly and the parliament elections, political leaders of different tribes — as it happens in the case of castes — try to mobilise the tribesmen on tribal lines. Thus there is a competition among the members of the vocal strata of different tribes. But at the same time, the vocal sections of all the tribes together bear a grudge against and exploit the labourers belonging even to their own tribe. They do not give them even the 'minimum' wages. They charge very high interests on the money that they loan out to them. They share common stereotype views regarding the poor tribals — that they are lazy, they drink too much, they are ignorant and illiterate, etc.

The better-off vocal Adivasis, on the other hand, identify their interests with those of the non-tribal middle and rich cultivators and the urban middle class. For instance, the middle and rich Adivasi cultivators in south Gujarat supported the *Khedut Samaj* (rich and middle peasant organisation of the state) against paddy levy and land ceiling in 1973-74. College-going Adivasi students joined the Nav Nirman movement led by urban middle class against corruption in 1974. They organised demonstrations and processions in tribal villages. Thus non-tribal better-off cultivators and middle class is the reference group of vocal Adivasis.

There is thus an informal alliance between the two — relatively better-off non-tribals (middle and rich cultivators as well as middle class) and better-off tribals. In this alliance, the latter have the place of junior partners, thanks to various historical reasons. Unequal partnership often creates clash between the two. The better-off tribals want to be at par with non-tribals of the same stratum but they suffer from certain constraints. They are new entrants in agricultural development; therefore, their know-how is limited. They lack a tradition of enterprise. Moreover, any new development programmes are taken advantage of first by the better-off non-tribals who dominate administrative and political machinery. Better-off tribals also face certain ecological disadvantages — their soil is rocky and rainfall is scanty. On the other hand, non-tribal middle and rich cultivators grudge any left-over or some special development programmes allotted to tribal cultivators. They feel this cuts into their resources and advantages. Their grudge is not only against the tribals but against any one including their own caste members with whom they are compelled to share a part of the cake.

Similarly, educated tribals aspire for white-collar jobs. They want to be equal to non-tribal *babus;* therefore they want quick promotion. But they are handicapped by their traditions and family socialisation from competing with non-tribal high caste white-collar employees. Non-tribal high or middle castes resent the fact that the jobs which they monopolised for many years is now to be shared with the tribals by virtue of the reservations. They dislike the entry of the new group in their economic activities. They use resources at their command to create obstacles in the way of educated tribals — which the latter resent.

In order to sustain in competition with better-off non-tribals the vocal

[illegible] of the tribals use ethnic sym[illegible] and idioms to seek the backing of [illegible] number of tribals. They mobilise [illegible] tribals whose class consciousness is subdued by talking euphuistically of [illegible] development' and 'tribal culture', [illegible] raising issues of 'tribal backwardness', 'injustice to tribals', etc. The leaders of the vocal sections pressurise the government for more and more 'tribal development'. Needless to say, this means the development of their own class in the tribal society as against the poor Adivasis. They are interested in seeing a middle or rich cultivator or an educated person from among them as a cabinet minister in the state, to get more reservations in white-collar jobs, to organise co-operative banks which can support Adivasi entrepreneurs to get irrigation facilities, fertilisers, improved seeds and so on. They make these and other demands in the name of the Adivasis, but in practice, their concern for an ordinary Adivasi is not only secondary but also instrumental. This has been possible because they are conscious of their interests whereas the poor Adivasis are docile and apolitical as far as class interests are concerned. The poor Adivasis are mobilised in politics by the vocal tribals on tribal non-tribal rather than on class lines. Moreover, the vocal strata of the tribals instil 'tribalness' in terms of tribal culture which tranquillises the poor. But vocal tribals themselves discard the so-called 'tribal culture' in their day-to-day life because it is against their own aspirations and interests.

In pursuance of their interests, the better-off vocal sections of the tribals often clash with similar strata of the non-tribal society. It is not a caste clash. That is, it is not due to differences in culture nor even primarily due to the biases against each other. The better-off strata does not share resources with the poor strata belonging to its own tribe with a view to fight the competing better-off strata of the non-tribals. It only uses the poor strata for its own interests. In fact, when its economic interests are threatened by the poor strata of its own ethnic group, it joins hands with non-tribal better-off strata. Thus, clash between vocal sections of tribals and non-tribals arises primarily from economic interests. At the same time, however, it cannot be called class war or class struggle. It is a conflict for economic interests between two ethnic groups belonging to the same class.

The above data are about one tribe But our contention is that what is true of the Chaudhri tribe is also true of several tribes and most of the castes. This calls for more detailed inquiry for understanding complex relationships between caste and class in India.

V

Conclusion

The foregoing data make it clear that [illegible]tiations based on wealth and [illegible] have taken place within the [illegible]dhri tribe during the last three [illegible] These differentiations are [illegible] in their social and cultural [illegible] too, weakening the traditional [illegible] identity. The strata which are [illegible] have become conscious of [illegible] economic interests. But the lab[illegible] poor cultivators are not [illegible]scious of their economic interests vis-a-vis the haves. The better-off strata take not only the advantage of the docility of the poor, but also tranquillise them further in the name of 'tribal culture', and instil in them 'we-ness' on an ethnic ground. This enables them to maintain and advance their interest as against similar strata within and outside the tribal society.

World Trade in 1978

THE value of world trade in 1978 amounted to about $1,280 billion, according to a first assessment of trade developments during the year by the Secretariat of the General Agreement on Tariffs and Trade (GATT). In dollar terms, the increase was about 14 per cent, or 1 per cent more than in 1977. The volume of world trade increased by about 5 per cent, compared with a 4 per cent increase in 1977.

Trade among industrial countries expanded in 1978 by some 18 per cent in value and about 5 per cent in volume. In value terms, industrial countries' exports to the oil exporting developing countries rose by roughly 20 per cent and those to the non-oil exporting developing countries increased somewhat more rapidly; while imports from the oil exporting developing countries declined by 5 per cent in value, those from the non-oil exporting developing countries accelerated, growing in 1978 at almost the same rate as exports to oil exporting countries. Exports to the Eastern trading area recovered strongly in volume from their decline in 1977, the largest increase being to the People's Republic of China.

The export earnings of the oil exporting developing countries are estimated to have declined by 4 per cent in 1978 owing to the fall in volume of their exports. The rise in the value of the imports of this group of countries slowed down to 15 per cent, the lowest rate since 1974. Their trade surplus was considerably reduced and, consequently, their current account surplus declined from $ 35 billion in 1977 to about $ 15 billion in 1978.

The export earnings of the non-oil exporting developing countries are estimated to have risen by about 9 per cent in 1978, compared with 16 per cent in 1977.

[illegible] Caste in a Tribal Movement

S D Kulkarni

This paper recounts briefly the origin and development of the Bhil movement in Shahada tahsil in Dhule district, Maharashtra, which began initially as a movement of the tribals against various kinds of oppressive practices by the non-tribals, to later cross tribal and caste boundaries and evolve into a peasant movement. The shift from the caste-tribal approach to a class approach and its effects are examined in the context of certain events in Prakashe, a village in Shahada tahsil.

The paper concludes that such problems as faced in Shahada are bound to arise in all tribal movements; and the lessons of Shahada are that class interests do not obey caste or tribal boundaries and movements based purely on caste or tribal questions cannot take up economic issues without modifying their tribal or caste character.

A NUMBER of movements are going on among different tribes in India.[1] These movements are of various types. Movements like the Nirankari movement in the Chamba district of Himachal Pradesh, Zeliangrong movement in Nagaland, Adi Samaj movement in Bihar and the Bhagat movements in Madhya Pradesh are mainly religious movements. Movements like those which took place in Arunachal Pradesh and Mizoram for the formation of a separate tribal state or the present Jharkhand movement in Bihar are mainly political Some movements are economic like those for the restoration of alienated tribal lands, for abolition of bonded labour, allotment of forest lands already under cultivation and for the protection of forests In some movements social, political and economic aspects are combined For example, the Bhoomi Sena in Palghar is trying to get the Bonded Labour System (Abolition) Act implemented and is at the same time persuading Advisis to cut down the expenses on marriages and to celebrate them without incurring debts.

However, even here one or the other aspect gets prominence. In purely social or religious movements, there is no class element. In purely or mainly political movements, different classes among the tribals and non-tribals unite to support or oppose the movement. Even a poor tribal feels like supporting the movement for a separate state, though such a movement may be carried on by the comparatively better placed tribal leaders whereas even a poor non-tribal is inclined to oppose it, though it may not affect him in any way The question of class element arises mainly in economic movements. Even in economic movements some issues are purely of sectional interests. Non-tribal poor cannot be associated in movements for the restoration of tribal lands or for the allotment of forest lands to the tribals. However, there are issues like the payment of minimum wages to agricultural labour or the enforcement of the Employment Guarantee Scheme wherein it is possible and poor.

A purely tribal organisation cannot fight successfully for these demands, especially in areas where there is a considerable proportion of the non-tribals among agricultural workers. An organisation of the poor working in tribal areas usually starts by organising the tribals who are the most exploited section of the society It is also easier to organise tribals who are a socially homogeneous group. However, a time comes when the organisation must shed its tribal character and assume the character of a working class organisation The tribal movement must transform itself into a peasant movement. The organisation must include in its fold the tribal as well as the non-tribal poor

It will be interesting to study different tribal movements from this point of view and to find out if and how they are in the process of transformation from a tribal to a peasant movement. Such a transformation is taking place in the Adivasi movement in Dhule district. An attempt is made here to describe such a transformation and its results.

Bhil Movement in Schedule

Before we describe the ongoing transformation of the Bhil movement into a peasant movement, it is necessary to describe the origin and development of this movement in brief.[2]

About 37 per cent of the total population of Dhule district is that of Bhils, the most prominent scheduled tribe in Maharashtra. Bhils are concentrated in Shahada, Nandurbar, Taloda, Akkalkuwa and Akrani tahsils. This region forms a part of the upper Tapi basin and is surrounded by Madhya Pradesh in North and Gujarat in the West. Tahsils situated in Tapi basin have rich cultivable lands. Agriculture in Shahada tahsil is highly developed. There is a high proportion of agricultural labourers in the working population. About 58 per cent of male and 92 per cent of female workers in the total rural workers in Shahada tahsil were recorded in the 1971 Census as agricultural labourers.

Persons belonging to an agriculturist caste (Gujar) migrated to Shahada tahsil around 1820. Development of roads, construction of railway around 1860 and the encouragement to cotton cultivation during 1860s helped the development of capitalist agriculture in the area. Gujars migrated to the region in large numbers and began to occupy the lands in possession of local Bhils through force and fraud. The Bhils displaced from lands were employed as bonded labourers.[3] The process of land alienation got further impetus after Independence due to heavy government investment in agriculture and irrigation and a spurt in the prices of agricultural produce[4]

With the large-scale ownership of lands, the non-tribals and particularly the Gujars became a very prominent caste in the region and began to oppress the Bhils in several ways. Loss of lands deprived the Bhils of their main source of livelihood and reduced them to the rank of landless labourers. A number of them were employed as *saldars* (labourers on annual contract) with low wages and long hours of work. Instances of flogging Bhil labourers, rape on women, burning of huts and other atrocities increased. The non-tribals had good contacts with government officials from the village to the state level. Most of the government officials were non-tribals; and so the offences against Bhils went unnoticed and unpunished. The officials, particularly those at the village level, had also their share of exploita-

tion Political parties were also dominated by the non-tribals and did nothing except paying lip service to the redress of the tribals' grievances.

Ambarsing Suratwanti, a Bhil in the employment of Sarvodaya Ashram at Dhadgaon, the headquarter of Akrani tahsil, was the first to organise the Bhils against this repression in 1969. He had the backing of some Sarvodaya workers. He began to go from village to village and to advise young men and women to organise and to resist oppression. In 1971 he, alongwith some Sarvodaya workers, formed Gram Swaraj Samiti and began to organise the Bhils. In the same year some educated non-tribal workers working with Baba Amte in Chandrapur district joined Ambarsing. The work of organising Bhil *saldars* and *rojundars* (casual labourers) began in full swing.

In the beginning, only the problems of the tribals were taken in hand. Satyagrahas were offered to regain the tribals' lands in illegal possession of the non-tribals. Satyagrahas were also offered on the so-called forest lands that were cultivated by the tribals for years These lands were shown as forest lands in government records but were actually under cultivation for a number of years. The forest officers used to collect fines for illegal cultivation. They also received bribes for the same. Every year forest officers would threaten to drive away the tribals from these lands and show that they were particular in guarding the forest lands. A demand to legalise the occupation of these lands was made and peaceful resistance was offered wherever there were attempts to drive away the tribals from lands under cultivation.

However, it was soon realised that there were some ideological differences between the Gram Swaraj Samiti workers and the educated persons who had come to work in the area. The Sarvodaya group wanted to concentrate upon resistance to atrocities by the non-tribals and the harassment of government officials To them these atrocities were of a local nature and not a part of the total system The young workers wanted to treat the tribal struggle as a part of the struggle against the overall oppressive system and wanted to organise tribals on a class and not caste basis.

In 1973, these workers and certain local tribal youths formed a group called Shramik Sanghatana. The two groups, however, decided to work together Ambarsing Suratwanti, the unifying force between the two groups, passed away in February 1974. The united front continued till the end of 1976. The main issues tackled by the movement till 1976 end included the prohibition of tribal land alienation, restoration of already alienated lands, legalisation of forest lands under cultivation, fixation of wages of *saldars* and *rojundars*. The movement achieved considerable success in organising the Bhils in Shahada and nearby tahsils. It also received wide publicity in newspapers. The landlords made organised efforts to break the movement by intimidation of the peasants, by lodging false complaints to the police against the organisers and finally by trying to unite all the poor and rich non-tribals against the tribals.

The organisers of the movement realised the necessity of including non-tribal landless labourers in their fold during the course of the movement. Certain features of the economy of Shahada tahsil also made such inclusion of non-tribals in the organisation imperative. Shahada has a very developed agriculture. The tahsil has the highest number of tractors (over 400) as compared to any other tahsil in the state Most of the landlords are Gujars while the other landlords are Brahmins, Marathas, Muslims and a few tribals. But there are also Maratha, Scheduled Caste, Muslim and even Gujar landless labourers. It was not possible to organise strikes of *saldars* and *rojundars* for higher wages without involving the non-tribal landless labourers, for the landlords tried to employ non-tribal labourers whenever the tribal labourers threatened strike, Sramik Sanghatana workers were always in favour of organising all the landless labourers as against only the tribal landless labourers.

The movement had also a political dimension. The gram panchayats were in the hands of rich non-tribal landlords. It was necessary to dislodge them if schemes of employment under the Employment Guarantee Scheme were to be implemented effectively. This could not be done unless the non-tribal poor were also included in the organisation. Attempts were, therefore, made to bring the dalits and other landless labourers in the organisation. The process of such inclusion and its effects have been described below. But to complete the description of the movement, it is necessary to describe the split in the movement that occurred in 1977.

The Split

The Gram Swaraj Samiti was formally constituted in 1971, though Ambersing and his associates began their work in 1969. The educated youths from outside joined him in 1971. Shramik Sanghatana was formed in 1973. There were ideological differences between the two groups. As stated earlier the GSS (Gram Swaraj Samiti) group looked to the issue of exploitation as a local one while the SS (Shramik Sanghatana) group looked to it as a part of the total system based on exploitation. GSS looked at the movement as a means of securing relief to the poor whereas the SS looked to it as a movement of the oppressed to challenge and ultimately to change the entire feudal-cum-capitalist system. GSS wanted to minimise the class conflict element in the movement while the SS wanted to maximise it. GSS had some faith in government measures and personnel while the SS looked upon government measures only as a tool for organising the tribals and the non-tribals. Besides the ideological issues, personal factors also contributed to the split as happens in every split in a movement or an organisation.

The ideological differences came to the surface mainly during Emergency. GSS wanted to resist Emergency at any cost while SS workers saw Emergency as a part of the oppressive capitalist system and wanted to strengthen the organisation to fight it in the long run. GSS workers decided to organise a tour of S M Joshi to create public opinion against Emergency. The move was opposed by the SS workers and was finally dropped.

When the Lok Sabha elections were announced the GSS workers threw themselves wholeheartedly in favour of the Janata party. The sworn enemy of the tribals in the area, a very prominent Gujar Congress leader, joined the Janata party. The SS workers hated the idea of supporting the Janata party and wanted to be neutral.

All these issues created tensions among the organisers of the movement and the GSS and the SS separated in August 1977 and are working independently since then. Though there is some inevitable rivalry between the two groups each appears to have accepted the existence of the other group.

Prakashe

It is interesting to study the shift from the caste to the class approach and

[illegible] out of which 504 [illegible] per cent) belonged to the scheduled castes and 1644 (25.39 per cent) belonged to the scheduled tribes. Like all the big villages in Maharashtra, Prakashe has a multi-caste population. Persons of all the main castes in the area, the Gujars, Brahmins, Marathas, Bhils, Koli (non-schedule tribe), Malis and Neo-Buddhists reside in the village There is also a considerable population of Muslims. By 1973 end the young Bhils took inspiration from the movement going around and organised a Tarun Mandal (Youth Club). The organisers of the movement encouraged the tribal youths and decided to arrange a big conference of the tribals at Prakashe. Accordingly, a very big one-day Adivasi Shetkari Shetmajur Parishad was organised at Prakashe on April 17, 1974, that, is nearly two months after the death of Ambarsing Some sympathisers of the conference later on criticised certain slogans raised there. *Lal Bawata ki Jay* was one such slogan. Comments were also made in certain newspapers on the nature of the attempts made to create a class movement.[5] This was a beginning of the differences between the GSS and the SS.

After this conference, the work at Prakashe received a big push It was decided to organise *saldars* and *rojundars*. Prakashe has a very large population of agricultural labourers. In the 1971 census, 740 males (43 32 per cent) have been recorded as agricultural labourers out of the total 1708 male workers in the village. The proportion of female agricultural labourers is still higher. Out of the total 440 female workers in the village 359 (81.59 per cent) have been recorded as agricultural labourers. As stated earlier, the tribals constitute about 25 per cent of the village population. [illegible] there are many non-tribal [illegible] and *rojundars*. A number of agricultural labourers in Prakashe belong to different castes like the Gujar, [illegible] Kunbi, Mali. There are also Neo-Buddhist and Muslim labourers, besides the Bhils. The majority of the landlords are Gujars, while there are few Brahmin and Maratha landlords. It is not possible to strike for higher wages for agricultural labourers without organising the labourers belonging to several castes.

This was brought home to the workers by a dramatic event that followed the Prakashe conference. Eleven days after [illegible] 1974, rich land own[illegible] Shahada tehsil organised a Shetkari Parishad at Shahada. Speeches condemning the tribal movement were made at this conference where a call to retaliate against the peasant movement was given. The following day, on April 29, landlords at Prakashe attacked the leaders of the movement and the fight resulted in the lodging of two complaints with the police The landlords lodged a complaint and named 395 persons as culprits. The names included SS leaders and almost all the Bhil persons whose names the complainants could remember. The list also included Neo-Buddhist, Maratha and koli labourers. The case had to be withdrawn as it was noticed that the list included persons who were dead and also those who had left Prakashe years before. The tribals lodged a complaint against 9 persons who are Gujars and Brahmins. The case is not yet decided.

After the incidence, the Tarun Mandal began to organise all the landless labourers in the village and today it has the backing of all the landless including Gujars, Malis and labourers of other castes and religions.

Gram Panchayat Election

The strategy helped the Tarun Mandal in fighting the Prakashe Gram Panchayat Election in May 1977 The Panchayat Sarpanch was a rich Gujar landlord who was holding the post for 15 years Tarun Mandal prepared a panel for all the 15 posts. It included tribals and the dalits for reserved posts, and also a Muslim, a Teli and a Bhoi and Gujars Ten persons from the panel were elected. One of Bhil got elected on a non-reserved general seat The former Sarpanch was elected and contested for the post of Sarpanch But one Gujar from the Tarun Mandal panel defeated him The rich landlord took this defeat seriously and gradually manoeuvred defections in the Tarun Mandal backed members. Following the example set by members of the Parliament and state assemblies, three members defected to the side of the landlord. A motion of no-confidence was brought against the new Sarpanch Tarun Mandal workers joined by the landless labourers and small farmers of all the castes and religions took a morcha to the panchayat office to protest against the motion. However, the motion was passed. The solidarity of the poor was expressed by the big morcha.

The solidarity of the poor organised as a class was expressed on another oc[illegible] [illegible] saldar who belongs to [illegible] which is not a scheduled tribe [illegible] the *saldars* in the village led by the Tarun Mandal took out a morcha in protest and compelled the police to arrest the landlord.

Conclusion

Thus the movement which started as a tribal movement is now a peasant movement and has crossed caste boundaries. This is not limited to only Prakashe village. The process has covered a number of villages. In Shahada town proper, there are over 100 non-tribal *saldars*. They have successfully agitated for a piece of land and a colony called Saldar Nagar is now established there Both the Gram Swaraj Samiti and the Shramik Sanghatana full-time and other workers include local Gujar and Maratha workers.

The problems faced in Shahada are bound to arise in all the tribal movements. Landlords in the tribal belt of Thane district are now united and ready to fight the Bhoomi Sena-led peasants Bhoomi Sena has also begun to organise the non-tribals along with the tribals in the area. Class interests do not obey caste boundaries and purely caste or tribe movements cannot take up economic issues without changing their caste character. This lesson has been learnt in Dhule and Thane districts and will have to be sooner or later learnt elsewhere also.

Religion and Politics

Role of Islam in Modern India

Moin Shakir

Communalism may be defined as that tendency which seeks to promote religious or sectarian grouping of a people for political purposes. The Muslim elite in India has been indulging in this practice for articulating its grievances, for communicating with the Muslim masses, for framing its political strategies and for maintaining a separate political status for the community.

This article examines the political and sociological dimensions of Muslim communalism in India. While actual voting behaviour of the Muslim masses brings hope to those sections of the Muslim elite who, however faintly, are striving to secularise Muslim politics, the obstacles in the path of such secularisation are many. The article briefly touched upon these obstacles, as also on the failure of Muslim intellectuals to present a comprehensive analysis of the Muslim situation in India without recourse to myths and mystification.

I

THE connection between religion and politics runs very deep. Religion, both in the West and in the East, influences political and non-political processes and affects the operation of the institutional framework of the State. Even in the developed countries where secularism has been accepted as an operative principle and where it is strengthened by the progress in the field of science and technology, religion continues to be more than a matter of personal and social significance. The reason seems to be, as pointed out by Grace Jones, that "basic religious beliefs survive in disguised forms in moral assumptions and cultural norms and they continue to mould the attitudes of many people to such institutions as the family, marriage, and the education system. This influence is exerted in a concealed way, either at the individual sub-conscious level or through the medium of indirect pressure politics, and it is, therefore, impossible to assess with any precision. It is none the less real for that".[1]

Religion is more pervasive in India than in the West. Probably this prompted Whyte to conclude that India is a "religious and not a political continent".[2] Besides till the advent of the British the idea of secular civic society did not come into being in India and consequently religion, in one way or the other, dominated State and society. The advent of the British power constituted a break from the ancient traditions and became, to borrow the apt phase of Marx, "the unconscious tool of history" in bringing about a fundamental revolution in the social State of the country.

Idealists as well Marxists agree that the rejection of religion as the opium of the people amounts not only to ignoring facts but the historical process itself by which these facts have assumed attached values.[3] Gramsci's observation is quite pertinent: "the three elements — religion (or 'active' conception of the world), State, Party — are indissoluble, and in the real process of historico-political development there is a necessary passage from one to the other",[4] it cannot be disputed that religion has been a part and parcel of cultural and civilisational development of any community. It is a dominant theoretical pattern which filters into the major activities of the various religious communities.

Islam has been one of the most powerful religions of the world. Arising at the time of new class formations in Arab society, it consolidated the power of the State. The role of the Prophet as a ruler of the State distinguishes Islam from other religions like Christianity or Buddhism. The latter could turn hostile to the acquisition of greater power. In terms of doctrines, Islam is not much different but the latter phase of the Prophet's life in Medina furnishes ample evidence of Islam's potentialities for managing a State. The subsequent Caliph's rule bears witness to many modifications, deviations and even contradictions in the political practices. These can be explained away by the fact that there is no definite political theory or practice which has the sanction of the Quran. It inevitably resulted in confusion. The benefit, of course, has been taken by the Ulema who by mystifying and obscuring the realities justified the powers that be. By citing certain verses of the sacred book,[5] quite out of context, the Islamic fundamentalists all over the world argue that the concept of democracy and socialism are thoroughly un-Islamic. One fails to understand as to how Saudi Kingship or Pakistan's military dictatorship or Afghanistan's socialist government is Islamic. If the institution of Kingship is Islamic how is Ayatollah Khomeini's claim that the fight against Iranian autocracy is based on Islam justifiable? It is also significant that in professedly Islamic republics or in the Muslim majority countries no mention is made of Islam's principle of social justice or equitable distribution of wealth, but[6] undue emphasis is placed on such petty points like cutting off of the hand for theft, prohibiting wine drinking, stoning to death for adultery, etc.[7]

Against this background the role of Islam in Indian politics should be examined. Islam has always been the religion of a minority in this country. Although it has been the religion of the rulers yet neither did it ensure equality nor emancipation from the feudal system. It remained fundamental to the system as it could call forth emotional allegiance of its adherents. The so-called custodians of religion wholeheartedly justified the institution of monarchy, slavery and exploitation. The dissent, if any, was on the issues of fundamentalism or over socially irrelevant matters. Tolerance and broad mindedness, if any, was the result of pragmatism and expediency rather than religious, (i e, Islamic) conviction. Consequently the Muslim government was founded not on Shariat (holy law) but on the laws and regulations of the king. What Allauddin Khilji told Qazi Mughisuddin seems to have been the policy of the Muslim rulers: "Although I have not studied science or book, I am a Musalman of a Musalman stock. To prevent rebellion in which thousands perish I issue such

rules as I conceive to be for the good of the State and benefits of the people. If men are heedless, disrespectful and disobey my commands, I am then compelled to be severe to bring them into obedience. I do not know whether this is lawful or unlawful. Whatever I think to be for the good of the State or suitable for the emergency that I decree".[8]

Under British rule the position of the Muslim community underwent a change. The rulers were the bearers of a modern culture and civilisation superior to that of the native subjects. The first reaction was antagonism which took a religious form. It was destined to collapse as it lacked ideological fervour and the support of the common masses, being merely a regional and emotional outburst rather than an all-India movement. It was, according to M Mujeeb, "a disintegrating rather than a unifying influence".[9] When a section of the Muslim leadership decided to co-operate with the British and accept the modern system of education it felt the necessity of change in socio-political and religious outlook, for other religious communities had already started thinking along those lines. The social reform movements in the Hindu community constituted a significant development as far as the religious outlook was concerned.

The case of the Muslim community was different. The nature and ethos of Islam is different from that of Hinduism. Hinduism has been flexible and tolerant, at least in the field of metaphysics. It has also been characterised by the absence of rigidity in matters of belief. In the process of interpretation and adaptation, Hinduism has been constantly reviewed and its base broadened. The basic tenets of Islam have on the ... a rigidity which would not brook any such liberties of interpretation as Hinduism allowed. The Hindus ... reject any scripture or doctrine ... no Muslim could ever do because ... powerful orthodox divines. The Muslim intellectual also faced the difficulty of defining his attitude even to the Hadith literature. The Hindu intellectual had the freedom in matters of faith and belief which enabled him to launch movements for religious reforms and start various organisations for the purpose while the efforts in the Muslim community centred on individuals who were careful while working on the secular plane not to disturb religious belief and there was no possibility also of creating organisations like the religio-social organisations of the Hindus. Syed Ahmed Khan's Aligarh Movement had little to do with religious reform. It was mainly an educational and political movement.

Mention of another point of difference will not be out of place here. Even after the decline of the Mughal Empire, the religion-oriented leaders continued to believe and hope that Muslim power could be restored in India by the organised effort of Muslims, with the help of the Hindus, if necessary. When the Hindus were making efforts for educational advancement and social uplift the Muslims thought that political power would solve all their problems. What is clear is that the Hindu elite was getting depoliticised while the Muslim elite's obsession with political power was complete. The defeat of the Mutiny in 1857 threw the Muslim community into a state of frustration. Syed Ahmed Khan and his movement failed to undertake the task of the modernisation of the religious and economic life of the Muslim community. The separatist political stance of the Aligarh movement provided an unhealthy bias to Muslim politics and thought in modern India.

It may appear strange but it is true that the Hindu community practically remained indifferent and aloof towards the efforts of the Muslim revivalists. Similarly the Muslim community was not stirred by the efforts made by the Hindu reformers. Thus mutual apathy may be viewed as the perpetuation of the medieval legacy. People lived together for centuries but did not constitute a society. In the words of Louis Dumount their "co-existence was empirically accepted without being legitimised".[10] In modern India every leader stuck to his own community or caste even in initiating social reforms; Rammohan Roy neglected the need of religious and social reform in the Muslim community, just as Syed Ahmed Khan failed to take note of the problems of the Hindu community. In a similar way, when the extremists advocated Hinduism as the basis of nationalism, they never tried to anticipate the reactions of other communities. Similarly, when Mohammed Ali and other Muslim leaders expressed their support to Pan-Islamism as a worthwhile goal, they likewise ignored its meaning for the Hindu community.

The British government released quite contradictory forces in Indian polity. The secular and liberal system of education, industrialisation, urbanisation, limited democratic experiment, new value pattern, growth of the spirit of rationalism, weakening of family ties, understanding of politics in new perspectives, did undermine the political potentialities of religion. But modernisation in a democratic framework never frees man from religion. Religion is not abolished but its role changes. There is freedom of religion and not freedom from religion. The prevailing situation in India has not been conducive to the abolition of the institution of religion.

The British attitude provided a new lease of life to religion in politics. The British viewed the Indian people in terms of their religion. To them horizontal divisions among the Indian people were not relevant; they deliberately emphasised vertical considerations. The vital realities of culture, language, religion and economic interests were thoroughly ignored. Conscious efforts were made to artificially divide the communities. Francis Robinson is quite right when he says that Syed Ahmed Khan was closer to Siva Prasad, his opponent, than to the Muslim weaver, as both belonged to what is called Urdu speaking elite group.[11] The fact was that the division between the elite culture and mass culture was complete.

The British also introduced the politics of 'weightage' and 'counterpoise' which, directly and indirectly, compelled the religious communities to strengthen their communal identities. Religion was one of the strongest factors which could sustain and promote communal identity and differentiation. Religion reinforced political demands and furthered political ambitions. It supplied the wished for ideology necessary for backward classes as theoretical expression of their interests.[12] The introduction of separate electorates widened the gulf between the religious communities and permanently closed the possibility of a secular outlook on the problems of the community. The communities participated in politics as religious entities. The result was, as Harold Could says, that "Muslims came to regard their religious identity more and more as demarcator of the different life stages, power needs and economic interests which they felt set them apart from Hindus. The manoeuvres which followed the advent of separate Muslim electorates in 1916 symbolised the politicisation of the religiously demarcated ethnic identity".[13] Communalisation of politics aggravated social tensions and

perpetuated "the struggle between those demanding a greater role for religion in the State and other demanding a secular polity".[14] In such a situation political organisations based on religion are bound to arise. Religiosity is used "to create a system of instrumental means and secular objectives rather than theocratic ones".[15]

Religion, in the 19th and 20th century India, has been a motivating factor behind all major political developments. In the birth of the Indian National Congress not only Theosophy but also Vedantic idealism were seen as the guiding principles. It was claimed that the revivalist movements were "really so many threads in the strands of Indian nationalism".[16] The manifestation and expression of Indian nationalism was 'predominantly in a Hindu idiom"; the prestige of Pandit and Pir was a force behind the national political bodies, and the revolutionary nationalist drew inspiration from Kali, Vedanta and Gita which was decidedly religious in nature.[17] Tilak's view of Indian nationalism is quite significant: "The common factor in Indian society is the feeling of Hindutva (Hinduness). I do not speak of Muslims and Christians as present because everywhere the majority of our society consists of Hindus. We say that Hindus of the Punjab, Bengal, Maharashtra, Telengana (Andhra) and Dravid (Madras) are one, and the reason for this is only Hindu Dharma. There may be different doctrines in the Hindu Dharma but certain principles can be found in common, and because of this alone a sort of feeling that we belong to one religion has remained among people speaking different languages in such a vast country. And this feeling of being one still alive...".[18] Tilak was for "militancy, resurgent Hinduism, regional and communal sensitivity, caste-consciousness, and social conservatism".[19] In the Swadeshi Movement and the Gandhi dominated Congress religious sentiments of the people were constantly exploited. Hindu symbols were used to mobilise the people. The Muslim community too adopted a similar strategy of using Islam for political purposes. Whether it was Syed Ahmed Khan's Aligarh Movement or Ameer Ali's Muslim Association, whether it was politics of the 'Old Party' or the 'New Party', or whether it was Mohammed Ali's Khilafat movement or the Moplah rebellion or the Pakistan movement, Islam has been a constant. It has been the unbroken thread of Muslim politics. The leaders wanted the members of the community believe that they were fighting for the cause of Islam.

A lucid explanation of the relationship of religion and politics is found in the writings and speeches of the Muslim League leaders. The following is a classic statement of these attitudes.

> The Muslims cannot divorce their religion from their politics. In Islam, religious and political beliefs are not separated from each other. Religion and politics are inseparably associated in the minds and thoughts of all Muslims.... Their religion includes their politics and their politics are a part of their religion. The mosque not only constitutes a place of their worship but also the Assembly Hall.... They are born into a system. The system is not thrust on them. Religion and politics are the same to them. Hence Hindu-Muslim unity or nationalism, signifying homogeneity between them in all non-religious matters, is unimaginable. The Islamic polity in which religion and politics are inseparably united requires perfect isolation for its development. The idea of a common state with heterogeneous membership is alien to Islam and can never be fruitful.[20]

The implications of this approach are quite clear. It suited both the British rulers and the Indian elite. The former should have been satisfied with the growth of the separatist tendencies and the latter with the tremendous success in establishing a rapport with the illiterate masses. The British succeeded in trapping the Indian elite which willingly played right into their hands.

It goes without saying that the British had a vested interest in communal polarisation. It came in the way of the unity of the poor of the different communities. Religious politics was the enemy of class politics. Religious politics, therefore, was neither genuine religion nor genuine politics. It ensured separate political existence to every religious community and made the consciousness of artificial identity a basic factor of political thinking. What M Mujeeb said about the Muslim League of the united provinces was true of Muslim politician in general: "I do not remember this belief (i.e., of Islamic state as a guide and a corrective to political conduct) was shared by the prominent men and women of Uttar Pradesh in the Muslim League camp. They were just not the type of persons who would undertake the intellectual task of analysing the concept of an Islamic State. Their allegiance to it was rhetorical; they did not care to be intelligent or serious".[21]

II

After Independence, secularism has been accepted as one of the bases of Indian polity. The horrid experience of partition riots convinced the Indian elite to minimise the role of religion in politics. But the great stumbling block in the way of such minimising has been the political heritage of the British era and the inability to deviate from the British approach to religion and politics. Except for the abolition of the separate electorates, the ruling elite in India has faithfully followed the British policy. Secularism is not viewed as separation of religion and politics but as giving 'equal status' to all religions though in practice the new rulers consider Hinduism as the fundamental factor in the field of politics. The renaming of India as 'Bharat' in tune with old Hindu tradition, the urge to promote Hindi (of a Sanskritised kind) as the 'all-India' language, an emphasis on the adoption of such symbols like Dharma Chakra, popularisation of superstition-ridden festivals as Ramlila, broadcasting of Bhajans and devotional songs in the early morning programme of All India Radio, extension of the governmental patronage to the Sadhu Samaj,[22] etc, betray a strong Hindu bias in the approach of the new rulers. It is also argued that Hinduism not only provides ideological and cultural content to the Indian State but also prepared the people to accept the social and political system.[23]

Islam is also destined to play an important role in the politics of the Muslim community. Even after the partition of the country Indian Muslims remain the second largest segment of the total population. They are more prone to accept the authority of religion and the Ulema.[24] Notwithstanding the desire of a section of the Muslim elite for separating religion from politics, the stresses and strains of the situation underline the utility of uniting religious faith with political interests. After all no community can be oblivious of its milieu and the larger setting of the community.

within the nation as a whole. In a competitive democratic polity, the principle of religious grouping as an instrument of pressure pays dividends; in the case of Muslims, it ultimately leads to Islamisation and political communalism. Engineered by the religious groups and exploited by the political elite, Islamisation separates 'Muslims from the cultural ties existing with Hinduism and increases identity consciousness and political mobilisation of the community.[25] Even those Muslims who do not accept the autonomy of worldly life feel contended with the prevailing notion of secularism. In the emergence of new political culture, "the contents of many religions are incorporated not because of their inherent spiritual authority, but because they are high parts of an existent national 'cultural' mosaic. Thus, orthodoxy withers, while a kind of religious revival blossoms .. Indian device of cultural pluralism, conceived internally as an egoistic policy and probably secularising in its long term effects, nevertheless preserves for India a distinctly spiritual aura".[26]

The tendency to promote the religious grouping of a community for political purpose, in other words, the phenomenon of imposing religion on politics is described as communalism. The Muslim elite has been using it for articulating grievances, in communicating with the masses, in framing political strategies and for maintaining a separate political status for the community. It has been a short cut to political power. It is strengthened by invoking the support from Islamic feelings, Muslim solidarity and Muslim culture which necessarily mean non-involvement in ideological and non-communal polarisation The Muslim political organisations, like Jamaat-e-Islami, Muslim League, Majlis-e-Mushawarat, etc, fall back on a romantic view of Islam implying that Islam alone is a perfect religion while all other religions are imperfect. The Muslims are acclaimed as champions of the Truth. The cause of their backwardness is seen as being due to the absence of training to draw upon the Quran in the solution of day-to-day political and social problems. The Muslims according to this view, do not constitute a religious minority but an international community or a party to enforce the truth of Islam. Their mission is to reform mankind. The considerations of minority are alien to Islam. The political ideology of the Muslim political organisations is therefore opposed to the ideals of nationalism, secularism, democracy and socialism. Such concepts are viewed as the concomitants of modern culture, and not in consonance with the spirit of Islam. These principles, according to the Muslim leaders, provide for atheistic materialism, Hinduisation of the country and de-Islamisation of the Muslims.[27]

The effectiveness of the political ideology of the Muslim organisation should be judged in the context of the political behaviour of the Muslim community. Abid Hussain is not wrong when he says that it is not the religious feeling but extraneous elements associated with religion and the name of the religion which are used by the elite for achieving certain political objectives.[28] The notion of identity consciousness or communalism owing to religion can also be questioned. It is not religion but the plural character of society and the federal nature of the State that produces communalism. It is nurtured not by religion but by the nonredressal of secular and genuine grievances of the Muslim community. It is not Islam but a sense of discrimination which creates a sense of unity. It is the feeling of insecurity which provides the sheet anchor to the notion of solidarity. It is politics, not the ideal of Islam or Pan-Islamism, which acts as the leveller of sectarian differences.

Various studies of the political and voting behaviour of the Muslim community bear this fact out.[29] They also bring forth the concept and difference between the Muslim elite's perception of the political realities and that of the masses. The former always perceive the secular issues from the standpoint of Islam while the masses do not. The Muslim support to the Congress can be instanced here, even though several leaders of Muslim opinion mounted determined and firm opposition to that party. In the 1971 elections, for instance, the consensus of Muslim community, by and large, had been in favour of committed secular and democratic parties. The principle of en bloc voting on communal ground had been given up. The religion-oriented Muslim leaders who had asked the Muslim voters to boycott the elections proved to be ineffective. According to Gopal Krishna, the heavy penetration of the secular forces in and the political fragmentation of the Muslim electorate holds promise for those committed to secularisation of Indian politics and integration of the Muslims within the broad framework of a democratic secular political society.[30]

Nevertheless, one should not carry the impression that the goal of secularisation has been achieved. The obstacles are many. A comparative perspective regarding the growth of secularising tendencies in other groups of society and a meticulous analysis of socio-economic progress in the context of regions and communities is urgently called for. A probe into the existing gap between the common man and the elite is also necessary. Sufficient data about the class composition of the Muslim elite and the working of the Muslim organisations are not yet available. The present Muslim elite still carries the burden of the past on its shoulders. The reactionary heritage and fundamentalist legacy still haunts it. It still looks upon the issue of national integration as one of strengthening and uniting religious communities along sectarian lines and not as one of transcending and rejecting communal divisions. Its politics is of a compromise with the 'national' elite which is keen to accommodate it. This is how the facade of 'consensus' in the polity is being maintained. Both are inerested in engineering the consent of the masses and legitimisation of elite rule. The simple law of asserting its (Muslim elite's) hold in the community, as described by Marx in a different context, is to adopt a religious attitude to politics and political attitude to religion. Secularism in India, therefore, has amounted to no more than political rhetoric and a compromise with religion for political purposes.

The indifference on the part of the political parties to mobilising the Muslims on secular issues is another obstacle. The political and electoral processes encourage particularism and solidarity consciousness. The party setup and electoral system have not proved to be effective instruments of secularisation. They have failed to overcome the primordial allegiances of the electorate. Two trends in the Muslim political behaviour are quite significant in this context — political fragmentation, and social and religious solidarity. Political parties ought to recognise these two contrary trends in the Muslim community. The force of religious solidarity

[illegible] strengthened by the various [illegible] movements dominated by the [illegible] upholders of the fundamenta- [illegible] of Islam. Here lies the fai- [illegible] of the Muslim intellectuals who [illegible] wedded to a non-traditional app- roach. They are not only in India but [illegible] the entire Muslim world, though isolated and few in number.[31] Their critical intellect and independent thought have however not shaken the inertia of the masses and of the administrative and governmental organisations.[32] Be- sides, they are keen to take into account the ideological postures of those in power and their directives while offering any new interpretation of socio- political principles of Islam Consequen- tly the Muslim intellectuals in India have seldom been able to present a comprehensive analysis of the Muslim situation without myths and mystifica- tions. The social and economic composi- tion of the Muslim community is also not favourable to the growth of critical analysis. Consequently the conservative succeed in asserting that Islam still continues to be "the essence of the community" and not "the essence of the difference".[33]

Ca... An Empirical Analysis

P Sivanandan

An attempt is made in this paper to examine the interplay of caste and class forces in Kerala.

The present level of economic attainments among the major social groups is compared with the corresponding level three or four decades earlier in order to see if the contemporary caste-class relation is any different from that of the past.

The author examines, in this context, some aspects of the distribution of land-holdings and of educational and employment opportunities among the major social groups.

THE structure of the labour market and the distribution of assets in Kerala retain a very significant level of caste-class association, despite a certain degree of interpenetration. The exclusive traditional privilege of proprietorship and administrative and supervisory powers enjoyed by a group of superior and influential castes in the past are being shared also by a large number of other castes, belonging in particular to the intermediate section of the Hindu, Christian and Muslim communities Along with this upward occupational mobility, a certain extent of downward occupational filtration has taken place and it has naturally enlarged numerical strength of the labouring class This process of economic reorganisation among the various castes contains a unique feature namely class formation within a caste framework Nevertheless, the upward occupational mobility and class reorganisation among the lowest castes which traditionally constituted the dependent class of agrarian labour, are extremely minimal when compared to the experience of other caste/communal groups.

In this paper an attempt is made to examine the interplay of caste and class forces in the distribution of income earning opportunities. In our analysis we try to compare the present level of economic attainments among the major social groups with their corresponding levels three or four decades earlier in order to see if the contemporary caste-class relation is any different from that of the past. We shall in this context examine some aspects of the distribution of land-holdings, educational and employment opportunities.

Land-holdings

The pattern of land-holding seems to be an important factor around which caste-class relations develop. Available data for the Travancore region show that during the nineteen thirties the dominant castes, particularly the traditional caste Hindu sections, controlled the largest share of landed property in this region of Kerala. We do not, however, have comparable data relating to this period for the regions comprising present-day Kerala as a whole.

Table 1 shows that Brahmin households held on average 15.6 acres of wet land per owner and 12.89 acres of dry land per owner whereas households belonging to other castes held land ranging roughly between 1 and 3 acres. However, Nair households, in spite of a small average per owner, had a fairly large share in the total land (38 per cent in respect of wet land and 30 per cent in respect of dry land). Moreover, both the Brahmin and the Nair communities reported ownership on a much bigger scale than did the other castes, especially of wet land.[1] In the case of Nair households the low average of holding is explained by a process of partition among the joint family members, particularly during the 20s and 30s.[2] In contrast, among the other castes not only is the proportion of households reporting ownership low but so also is the average size of the holding per owner.

Thus the land ownership pattern during the 30s shows that there was a very high level of inequality in the distribution of land and in the proportion of land owners among the various com-

TABLE 1 : LAND-HOLDING PATTERN BY CASTE IN TRAVANCORE, 1931

Community	Wet Land		Dry Land		Average Area Per Owner (Acres)	
	Proportion of Owners	Proportion of Area	Proportion of Owners	Proportion of Area	Wet Land	Dry Land
Brahmin	1.08	8.75	0.62	3.05	15.60	12.89

munities. Land was thus concentrated in the hands of upper caste families. Those belonging to the lower castes had either no land or very little.

Before we study the changes that have occurred during recent decades, it is imp[illegible] [illegible] pronounced has continued to [illegible]tain a pronounced concentration of land among a small proportion of households. The data available for 1971-72 show that 68 per cent of the rural households operate less than 1 acre each, while 1.2 per cent of the households operating over 10 acres accounted for 15.1 per cent of the total operated area.[3] In general there has been a significant increase in the proportion of households cultivating small bits of land There has also been a reduction in the proportion of landless households.[4] The process has considerably tilted the traditional caste-class association: a certain extent of interpenetration has taken place, particularly in the lowest land size and landless categories.

To see the extent of this interpenetration, we may look at the pattern of land distribution among the various communities for an understanding of the prevailing caste composition in each land size class and the class composition of each community. The latest information we have in this regard is from a survey conducted during 1968 Though the data do not provide the share of land among the different communities, they give the proportions of households in each land size class Roughly two-thirds of Muslim and Ezhava households were either landless or owned less than half an acre, while the great majority of the Harijan households were similarly placed with respect to ownership of land (Table 2) On the other hand the proportion of households owning above 5 acres among the upper castes was significantly higher than that among the lower castes It needs to be noted, however, that roughly half of the Nair households and over 56 per cent of the Brahmin households also were either landless or owned less than half an acre each. These data thus show the extent to which downward mobility has taken place among the upper caste groups.

The class structure of the communities is vividly brought out by the distribution of total land owned by each community in each land size class Table 3 shows that among the landless and among those with small land holdings, the lower castes continue to predominate while in the larger size holdings, the upper castes and the intermediate castes constitute the dominant category. Therefore, the landless labour and small peasant classes continue to be composed mainly of lower castes, while the landlord and cultiva-

tor classes are largely constituted by persons from the traditional privileged classes, notwithstanding a certain extent of downward mobility among upper castes such as Brahmins and Nairs.

Education

Education and cultural advancement were considered to be the sole privileges of certain communities which enjoyed superior positions in the traditional social hierarchy. However, with the advent of colonial administration and as a result of social reform movements and political freedom struggles, there has been a considerable breakthrough in the spread of education among the masses. With large scale public and private investments, educational and training opportunities have improved throughout the state. In this context, a certain degree of relaxation of caste barriers in social relations has provided the new generation (belonging to all social groups) an opportunity to learn and improve their skills. The role of the national government is particularly significant since it has adopted numerous special assistance programmes for the upliftment of the backward castes/classes.

Nevertheless, the pattern of educational attainment and skill formation among the various social groups in Kerala seems to suggest that caste and class factors continue to influence its evolution. By looking at the educational advancement during the period 1931 to 1968, among the various communities, it is possible to assess the underlying pattern of change.

Table 4 gives data on the literacy rates among the different communities in 1931. These data show that literacy levels were generally very low among the low castes. By 1968, the literacy levels of all communities had gone up significantly (Table 5), thanks to the growing social and political awareness of the people. Nevertheless, the differences have persisted. For instance, among the superior caste Hindus, who have a long heritage in learning, landownership and political power, illiteracy is a rarity. Similarly the Christians, having a long record of involvement in commercial activities and agricultural pursuits, have utilised all opportunities for educational and professional advancement. The intermediate caste Hindus and Muslims who constitute a large proportion of the peasant, artisan and trading classes, have also begun to acquire modern education.[5] It is remarkable, in this context, that in addition to the government's efforts to set up educational and training institutions all over the state, these communities, particularly Nairs, Christians, Ezhavas and Muslims also themselves manage a large number of similar institutions. However, the rest of the communities which occupy the lowest position in the social hierarchy and form a significant section of the class of landless peasants and wage labour, have only very recently been introduced to literacy and modern education. Considering the long tradition of their social disability and economic backwardness, the government has, however, adopted a policy of protective assistance which includes pecuniary support and preferential treatment. Nevertheless, it is still a hard task for this poor and poverty stricken class to ward off illiteracy and attain educational levels similar to those of others in the society. It may be seen that although the literacy rates have improved considerably among people of the lower castes, most of them do not go beyond the school stage (Table 5). Among those who acquire higher general and technical education, the upper castes and the Christians continue to be preponderant.

Employment Opportunities

Upward occupational mobility among the higher castes was widespread. Those at the lower end of the social hierarchy on the other hand suffered severe occupational limitations in the past.

We have community-wise occupational distribution for the last four or five decades. These data show that traditional communal status and the pattern of employment were closely related. The occupational classification in the three regions of Kerala, *viz*, Malabar, Cochin and Travancore, available from the census of 1921, 1931 and 1941 shows very clearly the close relationship between profession and caste status which existed despite diversification of job opportunities in all sectors (Table 6).

The Brahmins and the Nairs were not only rentiers and cultivators but also the main participants in public administration and the learned professions. The Christians, the Muslims and the Ezhavas, however, had a mixed occu-

pational pattern. They were engaged in cultivation and industrial, trading and commercial activities. To some extent they worked also as wage labourers. On the other hand, the Pulaya or Cherumar community was restricted almost wholly to agricultural labour as the main occupation.

The industrial classification for 1961 and 1971 shows that the Scheduled Castes and the Scheduled Tribes, who formed only a tenth of the state's population, remain the major constituent in the labour force for agricultural operations and allied activities. Their participation as cultivators (except in the case of Tribals), owners of production processes, or industries or as persons engaged in business or commerce, is extremely low when compared to the other communities.[6]

The 1968 survey gives a detailed description of employment pattern among the various social groups in terms of (a) Activity Status (Table 7), (b) distribution of gainfully employed persons in various occupations (Table 8) and (c) caste composition of workers in each occupation (Table 9). In these Tables the selected communities are classified (according to socio-economic similarity) into five groups, namely (A) the Hindu Upper Castes (Brahmin, Ambalavasi and Nair), (B) the Christian sections (Syrian Catholics, Jacobites, Marthomites and Latin Catholics), (C) the Hindu Intermediate Castes (Ezhava and Kammala), (D) Muslims, and (E) Scheduled Castes, Scheduled Tribes and their converts to Christianity.

It is characteristic among the upper caste Hindus (A) and the Christian sections (B) to have a larger proportion of student population and a lower proportion of wage earners when compared to other communities. The workers among them are mostly distributed in the salaried, employer and self-employed classes. The intermediate caste Hindus (C) and Muslims (D), while having a lower proportion of student population — compared only to (A) and (B) groups, — have a larger proportion of workers in the wage labour and self-employed categories. However, the proportions of salaried and employer sections among them are higher than those among other communities below them in the social hierarchy, namely (E). The lowest proportion of non-working population (student + 'others') is among the Scheduled Castes and the Scheduled Tribes (E). The main activity of these communities is daily wage employment. There are only a few among them in the salaried and employer classes. Though about four per cent of workers among the Scheduled Castes have reported as self-employed, the occupations concerned are by and large related to traditional crafts supplementary to agricultural production.

The broad classification of communi-

ties into various classes of activity status throws further light on the nature of their participation in specific occupations. In Table 8 the employment opportunities are grouped into seven broad categories, namely (I) technical, professional and administrative, (II) trade and sale, (III) farming, (IV) crafts, (V) service, transport and communication, (VI) agricultural and allied labour; and (VII) unskilled labour. This classification brings out the fact that the upper caste Hindu and Christian communities have comparatively larger proportions of earners in the first three categories of occupations. However, each of these communities has certain predetermined advantages which give them a relative superiority over other communities. For instance, the Brahmins who claim antiquity in landlordism, learning and intellectual pursuits have the largest proportion of earners in technical, professional and administrative careers. They are also very much involved in farming, business and service occupations. The employment pattern among the Ambalavasis, who were originally temple servants and associates of the Brahmin aristocracy, is closely similar to that of the Brahmins. The next most advantageous position in acquiring remunerative occupations is held by the Nairs who once formed the militia and the tenantry of the land. Most of the Christians, who were tenant farmers, peasants or traders during the pre-capitalist system have benefited considerably from the onset of capitalist tendencies in agriculture since the close of the 19th century.[7] They have pioneered the process of land reclamation and developing plantations, by investing their savings from trade and other activities. The spread of education which was much faster among them, also made them competent to hold administrative, technical and professional occupations.

These communities have, therefore, achieved a higher level of economic advancement mainly because of their concentration in professional, commercial and farming activities. On the other hand, the intermediate caste Hindus (C) who have experienced social disability and have traditionally constituted a major section of the peasantry and artisan class, continue to retain a considerable proportion of their earners in the same occupations as in the past. The Muslims (D), as a community, though traditionally not averse to any particular occupation, are primarily agriculturists, traders and commercial people. Their representation in other occupations is nearly equal to the state average. On the other hand, the Scheduled Castes, Scheduled Tribes and their converts to Christianity, who have endured in the past the most severe forms of social and economic disabilities have poor representation in the more remunerative occupations.

A community-wise distribution of earning persons in each major category of employment would, however, provide a little more insight into the caste-class composition in various occupations. Table 9 shows that better and more remunerative employment is largely associated with traditionally high caste status and occupational freedom. It is also significant to find that the appropriation of various salaried jobs under the government and quasi-government sectors has been largely disproportionate among the different communities despite well-defined legislative regulations for safeguarding the interests of

all social groups, particularly that of the weaker sections (Harijans and Other Backward Communities). The latest available information (1968),[8] in this regard, shows that the forward communities hold the maximum number of jobs. More than two-thirds of the 'gazetted', over one-half of the 'non-gazetted' and nearly half of the 'last grade' jobs are held by members of this group alone, which constitutes only a third of the state's population. The representation of the other Backward Communities in salaried jobs has not been quite close to the 'norm' (i e, their proportion in the total population) and the disparity is most significant in the case of appointments in the 'gazetted' category. The Ezhava and other Hindu communities in this group have managed to obtain a fairly good number of jobs in the 'non-gazetted' and 'last grade' services. The Christian sections have a satisfactory representation in all categories of jobs. The muslim community, which forms almost one-fifth of the population, is poorly represented in all categories of jobs. The representation of Harijans and their converts to Christianity is the lowest in all categories of salaried jobs except, perhap, in the last grade jobs of certain departments.

Income Distribution

Finally, the earning pattern of the various communities will provide information on their respective levels of economic attainments. Table 10 confirms that income levels are closely associated with caste hierarchy. The lowest among the castes are also the poorest earning groups and vice versa.. This is, however, the natural culmination persistent disparity in the distribution of land-holding education and employment opportunities.[9]

In short, caste-class identity is an inherent feature in socio-economic relations in Kerala, although it has now a certain level of interpenetration on account of the influence of social movements, political forces and administrative reforms. However, the intervention of these factors in the reorganisation process does not radically alter the caste-class association.

Notes

1 The proportions of households reporting ownership of wet and dry lands among the various communities are respectively: Brahmins 42.3 and 59.8; Nair 51.2 and 78.4; Syrian Christians 26.3 and 67.6; Muslims 20.4 and 53.5; Ezhavas 13.2 and 45.9; other Hindu 13.4 and 20.9; and the averages for all communities 20.8 and 51.4 (Sources: *Census of India 1931* cited in Table 1).

2 T C Varghese, "Agrarian Change and Economic Consequences: Land Tenures in Kerala 1850-1960", p 103.

3 Tables on Land-holdings, State, Kerala Vol I, No 215, National Sample Survey.

4 The propertied class has always been resorting to judicial and political means to retain their land possessions. The liquidation of the first Communist Ministry which had introduced the first Agrarian Relations Bill (1957), the land sales and transfers during the sixties (see "Land Reforms Survey in Kerala, 1966-67", Bureau of Economics and Statistics, Trivandrum 1968), the slow process of disposal of land disputes, etc, are all part of the attempt to safeguard the interests of the landlord class. The landlords have been using communal organisations and political pressures to obviate the possibility of losing land rights. The resistance to radical land reform was so high among the landlords, the capitalists, the dominant communal organisations, and their political supporters that the subsequent land legislations during 1960, 1964 and 1969 were diluted considerably in respect of provisions affecting their interests.

Political Persecution in West Asia and Africa

ACCORDING to Amnesty International Report, 1978 in many countries of West Asia and North Africa political prisoners frequently had no access to fair trial and, often, received no trial at all. For example, Palestinians were convicted or detained without trial by Israel for their critical attitude toward Israel's presence in the Occupied Territories rather than for violent activities. In Egypt a number of people who distributed leaflets criticising President Anwar Sadat's November 1977 visit to Israel were detained. However, by far the greatest number of human rights violations in the area related to issues not at the center of world attention. Some examples: In Iraq, alleged Communist Party members were executed as were suspected Kurdish dissidents, many of whose relatives were also imprisoned. Hundreds of people were arrested in Tunisia for trade union activities. In Morocco people of Saharan origin remained in detention on account of their ethnic origin. In Syria, alleged sympathisers of the Iraqi Baathist Party, Marxists and members of the Muslim Brotherhood were imprisoned. In Iran, people in leftwing and religious opposition alike were imprisoned, while in Algeria former President Ahmed Ben Bella spent his 13th year under house arrest.

The white minority governments of southern Africa continued to imprison suspected suporters of various black nationalist movements. In Rhodesia/Zimbabwe detention without trial remained the most common form of imprisonment. Although 700 of 950 known detainees were released in early 1978, new detention orders continued to be issued and more than a thousand convicted political prisoners remained imprisoned. In Soutn Africa, detention without trial and banishment remained common in political cases.

Elsewhere in Africa, government action against real or alleged conspiracies led to the imprisonment, often without trial, of suspected rivals of those in authority. In some cases — in Congo, Equatorial Guinea, Somalia and Zaire — persons thus detained were executed after trial or summarily killed. In Ethiopia, thousands of people suspected of opposition to the authorities were killed in a programme of "revolutionary terror". In Uganda, where the practice of murder by security forces had, at times, reached "massacre proportions", members of the Lango and Acholi tribes were killed because of their tribal origin; political imprisonment for similar reasons occurred in a number of other African states.

Caste and Class in Bihar

Pradhan H Prasad

The policy of reservation of jobs and promotion opportunities in government services in favour of the middle castes in Bihar, in the teeth of stiff opposition from the upper castes, only highlights the political reality of the present dominant position of these castes in the state. The unprecedented violence that has accompanied the implementation of this policy might last for a while, but the process itself is irreversible.

This article attempts to relate the emergence of these 'middle castes' into a position of political power in the state to the continuing process of disintegration of semi-feudal production relations in Bihar. It argues that the farming of caste passions which on earlier occasions had led to a diffusion of class contradictions may now turn out to be a factor which may in fact sharpen and intensify these contradictions.

BIHAR is today in the midst of one of the worst phases that can be found in the life cycle of a caste-ridden society. Though there have been caste rivalries and caste tensions in Bihar since long, there was a distinct qualitative increase in their tempo following independence. And now we are in a phase which can be aptly described as one of 'caste riots'. It must also be noted that the present phase is very different than the earlier phase. Today what is happening is mainly the outcome of a contradiction that exists between the upper caste Hindus and the middle castes (i e, the backward caste Hindus other than the Scheduled castes and Scheduled tribes). Earlier the contradiction was mainly within the upper caste Hindus.[1]

The social and economic roots of the contradiction which has brought about the present situation lie almost wholly in rural Bihar, are related mainly to agriculture and are historical in nature. The dominant mode of production in the pre-British India was feudal which had almost completely collapsed by 1857. This marked the beginning of the colonial mode of production in India. But here also all the features of the feudal mode of production were not allowed to disintegrate. Some were retained. The Permanent Settlement of 1793 had brought in a new form of landlordism and there emerged a long stratification of zamindars, tenant-landlords, tenants, and sub-tenants with agricultural labourers being mostly at the bottom.[2] During most part of the British period control over land and tenants was mainly enforced through land rent. On the other hand, the passivity of agricultural labourers and the traditional mode of payments to and exactions from them resulted in most of them emerging as 'chronically deficit' households in no time. The high pitch of land rent and the other share of zamindars robbed the tenant-landlords, cultivators and big peasantry of most of its surplus, deprived the middle peasantry of almost the entire of it and saw to it that the class of poor-middle peasantry also emerged as 'chronically deficit' households. Usufruct mortgage of land by middle peasantry also became frequent because of high pitch of land rent. The dynamics of the situation found the poor-middle peasantry and agricultural labourers losing quite a significant part of their land to the landlords and the village money-lenders (who subsequently became tenant-landlords).[3]

This, however, did not end here. It soon brought about a situation where the bulk of the poor peasant households began to take consumption loans on a fairly regular basis from landlords, cultivators and big peasantry — the main constituents of the rural rich. In most cases, the stipulated rates of interest were exhorbitantly high. Leave aside the loans, even full payment of interest was often beyond the means of these 'chronically deficit' households. But the creditors also did not insist on full payment even in the long run. The rural rich used this debt obligation to put the poor peasant class under an informal bondage. As no system can afford to provide for less than subsistence living to direct producers, this system also made such provisions. But the whole subsistence payments were not made in lieu of work; only a part of it was given as payment for work and the rest as consumption loan.

This was done mainly to perpetuate the system of indissoluble bond between the direct producers and their overlords — the rural rich. The informal bondage was also enforced by leasing-out tiny plots of land or by giving the poor peasants homestead land or dwelling space. Though this provided enormous economic benefits to the rural rich, it could not elevate the tenant-landlords, cultivators and the big peasants to the level of zamindars. Despite this, the zamindars could not acquire much of either economic power or political power of any significance mainly because of the colonial mode of production which mopped up almost all the surplus and used it partly for retaining its political and administrative grip over the colony but mainly for the development of the metropolis. But since it gave some crumbs to the zamindars for their petty luxuries and localised political power (subordinate, of course, to the colonial power), this class never came in conflict with the colonial power. On the other hand because of the high pitch of land rent, the tenant-landlords, cultivators and big peasants were restive. They were anti-British and anti-zamindar.

The caste base of these classes were as follows. The Zamindars, the tenant landlords, cultivators and big peasants were mostly upper caste Hindus.[4] The poor peasants were mainly from what is today known as Scheduled Castes and middle castes. The poor-middle peasantry and the middle peasantry were drawn mainly from middle castes. Though quite a large number of them were leasing-in land as sub-tenants (mostly as share-croppers) on terms much harsher than those available to the tenants, the contradiction between them and the tenant landlords did not achieve a level to form the basis for an independent struggle for their emancipation. Tradition had kept them socially backward. Their relative economic situation was also quite precarious — only a shade better than that of the poor peasants. Moreover, even in numbers they were not having any substantial advantage over the landlords. The ratio between the middle and the poor-middle peasants and the landlords did not exceed two. However, when the tenant landlords, cultivators and the big peasants launched their movement in the late 1920s, their main demands were 'rent reduction' and 'return of lands which were sold as a result of rent decrees'. As the movement touched its peak during the later half of the thirties, the demand no longer remained confined to the immediate problems of

tenancy but grew into a bid for zamindari abolition.

But at no time did the problems of sub-tenancy and of poor peasantry find a prominant place in their charter of demands. The hegemony of the movement remained in the hands of upper caste Hindus, specially the Bhumihar Brahmins. The anti-British approach of the tenant-landlords, cultivators and big peasants made them also the active supporters of independence movement in rural Bihar. Therefore, with independence came the zamindari abolition. But with the zamindari abolition in early fifties, this contradiction also vanished. Political power in Bihar, thus at that stage, passed into the hands of the landlords,[5] cultivators and big peasants — the upper caste Hindus. Inflationary pressure arising out of Second World War and thereafter in the forties and the fifties considerably reduced the burden of land revenue, and the landlords, the cultivators and the big peasants found themselves loaded with surplus produce. The approach to developmental planning in the post-independence era also led to public investment in infrastructure meant for agricultural development. But these did not prove powerful enough to bring about rapid development in agriculture.

The landlords, the cultivators and the big peasants did not allow the system of informal bondage to disintegrate. With the help of this practice and the newly acquired surplus, they also became politically very powerful. They claimed the bulk of the benefits that began to flow in the area either in the name of developmental activities or the rural poor. They began to operate as sole arbiters even in the context of distribution of relief and other essentials like sugar and kerosene. For all practical purposes they became the law in their areas.

The rural rich have thus developed a vested interest in the continuation of mass poverty where the vast bulk of poor peasantry remains in perpetual 'deficit'. The gains arising out of this backword 'semi-feudal'[6] agrarian structure have made the rural rich not enthusiastic about rapid development which, if allowed, is likely to improve the economic condition of poor peasants who can thereby free themselves from the 'informal bondage'. Therefore, the dominant classes, the rural rich, have not been enthusiastic about dynamicising agriculture in a big way by taking the advantage of the new technology. That is why the bulk of resources for development activities are either wasted away or are used up on conspicuous consumption. It also explains the low utilisation of infrastructure meant for agricultural development and the almost negligible net investment in agriculture by the rural rich. It also partly explains the absence of dynamism at the state government level for undertaking a vigorous drive for rapid development of agriculture on the right lines.

On the other hand the middle and the poor-middle peasantry did not suffer from the aforesaid inhibitions in the context of development. The inflation had given them some relief. They began to use their newly acquired surplus (though it was very meagre compared to what was available to the rural rich) for the development of their agriculture. Later on they took to new technology as it came by. They had begun to redeem their lands which were under usufruct mortgage. This process started in the late forties. The zamindari abolition also found quite a significant number of them being elevated to a position of tenants from that of sub-tenants. Numbers also became important in the context of new political superstructure borrowed from the advanced capitalist countries. On the other hand caste groups within the upper caste Hindus vied with each other for political power and in the process the caste factor became crucial. In order to win over the down-trodden to the side of the ruling faction, concessions in terms of seats in educational institutions and jobs in government sector were offered to the Scheduled Castes and Scheduled Tribes. Some of the groups began to promote leaders from the Scheduled Castes and middle castes under their patronage in a bid to win over these castes to their side.[7] This undoubtedly defused the class contradiction between the rural rich and the middle and poor-middle peasantry for the time being. But it also raised the hopes and aspirations of the Scheduled Castes and the middle castes. zamindari abolition had already demonstrated that the traditional superiority of the upper caste Hindus was not invincible.

The petty bourgeois reformist pressure and the contradiction within the upper caste Hindus (the landlords, the cultivators and the big peasantry) and also between the upper caste Hindus and the middle castes (the middle and the poor-middle peasantry) arising on account of hunger for land led to various land reform legislations, particularly the legislation related to ceiling on land-holdings. Though these enactments remained mostly on paper, the small among the landlords, the cultivators and the big peasantry sold the surplus land, not within their own class but mainly to middle peasants — the up and coming agricultural class — because of their better paying capacity. The process was of course slow, but in course of time control over at least 10 per cent of the land passed into the hands of middle peasantry, if we take into account also the redumption of usufruct mortage since the late forties and the acquisition of tenancy rights by middle and poor-middle peasantry in the wake of zamindari abolition.

Thus, the middle and poor-middle peasantry emerged as most efficient class in the context of agricultural development in 'semi-feudal' Bihar. With their newly acquired economic power,[8] they made a successful bid for the capture of political power. The demon of casteism which was created by the elites of the semi-feudal set-up (the upper caste Hindus) to keep themselves in political power has now turned against their creators. It is now being used by the middle and poor-middle peasantry to rally the middle castes from the poor peasantry class also to their side. They now outnumber the upper caste Hindus by a ratio of more than 1:2. By now for every one acre land in the hands of upper caste Hindus the landlords, the cultivators and the big peasantry), the middle and poor peasantry own about two-thirds of an acre. In operational terms the share of the latter is even more. The level of adoption of new technology in the case of the latter (even with the meagre resources that they command) is higher than that of the former. Therefore, the per acre output in case of the latter is on an average about 20 per cent higher than that of the former. The latter's intensity of cropping is also much more than that of the former.

The recent reservations in appointments and promotions in government in favour of the middle castes in the teeth of stiff opposition from the upper caste Hindus is proof of the political supermacy of the middle castes. No doubt this has led to unprecedented violence on caste lines, but it is not going to reverse the process. The violence will last for some time, and then it will find the middle castes in control of the political power in the state. Of course, there will be some attempts on the part of groups dominated by upper caste Hindus to capture power. Some of them may even adopt "semi-fascist" strategies. Some may try to woo the

Scheduled Castes and other minorities to their side. The 'semi-facist' strategy may have some chances of success but the latter (wooing of scheduled castes and other minorities) has probably none because there is no love lost between the elites of the semi-feudal set-up and poor peasantry. No doubt there is an antagonistic contradiction between the middle peasantry and the poor peasantry (and the chances are that the contradiction may sharpen with the increased economic power of the middle peasantry as illustrated by the increasing number of atrocities on Scheduled Castes), but there is also an antagonistic contradiction between the landlords, cultivators and big peasantry on one side and the poor peasantry on the other arising out of semi-feudal bondage.

But this contradiction will probably take a low profile as the semi-feudal set-up disintegrates. However it will be replaced by another contradiction between new upper caste Hindus kulaks and the poor peasantry. However, what is certain is that this will lead to the disintegration of semi-feudal production relation. The landlords, the cultivators and the big peasantry will now forsake their earlier approach to agricultural development and will take steps to dynamicise their cultivation in a big way. The fanning of caste passions which at one time led to a diffusion of class contradictions, and thwarted agricultural growth, now turns out to be a factor which may sharpen the contradiction and cause the disintegration of 'semi-feudal' production relations in Bihar.

Notes

1 Bihar is the second most populous State in India accounting for 10.3 per cent of the country's population. The dynamics of rural Bihar (particularly North and South Bihar plains) has so far been almost wholly dominated by Hindu population which is 83.5 per cent of the total. Therefore, the exclusion of the rest 16.5 per cent (including the tribals and its stratification does not vitiate the analysis.

Brahman, Rajput, Bhumihar and Kayastha are the important upper castes among Hindus accounting for about one-sixth of the total population. There are two other caste Hindus — Agarwal and Khatri — but they account for only 0.1 per cent of the population.
We shall term the backward caste Hindus other than the Scheduled Castes and Scheduled Tribes as middle castes. The list of these backward class Hindus, Scheduled Castes and Scheduled Tribes is given in the Report of the Backward Classes Commission (Government of India), Volume II, pp 16-22; 142-3 and 212-3.

2 The classes has been differentiated as follows. All those households who supply physical labour in agriculture are peasant households. Those peasant households where members of the households work on other people's lands in lieu of some payment either cash or kind or of debt servicing are termed as poor peasant households or agricultural labourer households. We use the terms 'agricultural labourer' and 'poor peasant' as synonymous. Those peasant households who conduct their agricultural activities mainly with the help of the members of their households and where no member of the households works on other people's lands in lieu of any payment or debt servicing are poor-middle peasant households. The big and the middle peasant households are those who purchase labour power; but in the case of big peasant households the female members of the households do not go to work in the field. Because of this fact the status of a big peasant household is traditionally deemed to be higher than that of a middle peasant household in rural Bihar. No member of the household of a big and middle peasant works on other people's lands in lieu of any payment or debt servicing or even as exchange labour. Cultivators are those who only supply supervisory labour to their cultivation. All those households other than poor peasant households leasing-out land are termed as landlords. Zamindars were such landlords who paid land revenue to government. The tenants paid land rent to the zamindars. Those of the tenants who leased out land are termed as tenant-landlords.

3 The term 'landlord' includes both zamindar and tenant-landlord prior to abolition of zamindari and tenant-landlord subsequent to it.

4 The big peasant households were not of much significance. Even as late as in the forties of this century their percentage in the total rural households did not exceed one.

5 The ex-zamindars mostly became tenant-landlords — hereinafter termed as 'landlords'.

6 For evidence suggesting widespread existence of semi-feudal production relations, see Pradhan H Prasad; 'Production Relations: Achilles Heel of Indian Planning, EPW, May 12, 1973; 'Reactionary Role of Usurer's Capital in Rural India', EPW Special Number, August 1974; 'Poverty and Bondage', EPW, Special Number, August 1976; and 'A Strategy For Rapid Development of Bihar Economy', *Journal of Social and Economic Studies*, Volume II, 1977.

7 For example, the proportion of non-upper caste among Hindus in the Executive Committee of Bihar Pradesh Congress remained less than 8 per cent before 1947, but it suddenly shot up to 29 per cent in 1948 and 32 per cent in 1954. See Ramashray Roy, 'Caste and Political Recruitment in Bihar', in Rajni Kothari, (*ed*), "Caste in Indian Politics", Table 4, pp 242-3.

8 This has been rising since the mid-fifties. It will be seen that there was a significant increase in the educational standard of non-upper castes among Hindus as a consequence by the late fifties. See Ramashray Roy, *op cit*, Table 3, p 233.

World Milk Production

WORLD milk production in 1979 will rise faster than demand, aggravating problems in the troubled dairy sector, according to a report released by the Food and Agriculture Organization of the United Nations (FAO).

Last year, excessive milk supplies in major dairying countries necessitated costly surplus disposal measures, kept prices in world dairy product trade at low levels and discouraged needed expansion of milk production by developing countries.

During 1979, excess supplies will increase, FAO predicts. Milk production will rise faster than in 1978, when it rose about 1 per cent to 457 million tons, but will not equal the per cent rise of 1977.

Milk production will be encouraged by abundant feed supplies from the bumper 1978 harvests and by higher government price supports in the USSR, Eastern Europe and Oceania. According to FAO, milk production will level off this year only in North America.

Demand for milk is strong in Eastern Europe and the USSR and in some developing countries, notably oil exporting countries following the recent rise in oil prices. However, sluggish demand is likely in the major markets of North America, Europe and Oceania.

FAO sees little hope for higher prices in international dairy trade this year. Export markets are oversupplied, and despite some rise during the past year, trade prices of skimmed milk powder remain depressed, at about one-third of the domestic market levels of northern hemisphere dairying countries. With saturated domestic and exports markets, dairy product stocks will tend to rise again, notably in the EEC and Oceania.

Adver

THE supposed *rural tilt* of the Union budget for 1979-80, which promises to provoke much controversy, is not among its most significant aspects. The budget is most noteworthy perhaps for what it reveals about the state of the government's finances. The anticipated deficit in 1978-79, already put at Rs 1071 crores, has shot up to Rs 2145 crores according to the revised estimates. This includes the special loans of Rs 555 crores which the Centre has had to extend to some of the states to enable them to clear their overdrafts with the Reserve Bank. The expenditure on the Central Plan for 1978-79 met out of the budget has, on the other hand, turned out to be Rs 201 crores *lower* than the budget provision.

In his budget speech the Finance Minister has harped on the importance of restricting non-developmental expenditure as well as various types of subsidies. However, it is precisely the uncontrolled rise in these components of government expenditure which, together with the need to bail out the state governments with Rs 1075 crores of grants and loans in excess of the provision in the budget, that has been responsible for what must be easily the largest deficit in the entire history of the Central government's finances. The food subsidy has turned out to be Rs 570 crores instead of the budget estimate of Rs 450 crores, the fertiliser subsidy Rs 319 crores and the export subsidy Rs 381 crores instead of Rs 251 crores — to mention only the more spectacular items. Further, despite the much-vaunted improvement in the performance of public sector units in the last two years, as much as Rs 409 crores had to be paid out of the Central budget as non-Plan loans to these units to meet their cash losses. This was Rs 159 crores larger than the already generous provision of Rs 250 crores made for this purpose in the budget.

On the other hand, receipts from corporation tax, income tax and excise duties have all turned out to be lower than the budget estimates — by Rs 206 crores in all. This is quite remarkable, given official claims of an 8 per cent rise in industrial production in 1978-79. Only the open-door import policy has shored up the government's tax receipts, by yielding Rs 336 crores more by way of customs revenue than estimated in the budget. The behaviour of receipts from income tax is particularly noteworthy. When the highest marginal rate of income tax was slashed from 97.75 per cent to 77 per cent in the 1974-75 budget and again from 77 per cent to 66 per cent in the 1976-77 budget, the argument advanced by the government, and enthusiastically endorsed by those sections who stood to gain from these reductions, was that the lower rates would result in less tax evasion and better tax compliance, so that on balance the government's receipts from income tax would not suffer at all. The actual trend in income tax receipts since 1974-75 tells an altogether different tale. To resort to some rough and ready calculations, between 1973-74 and 1977-78, receipts from income tax went up by 34.5 per cent, whereas national income at current prices rose by 44.4 per cent. By contrast, between 1970-71 and 1973-74 income tax receipts had risen by 57.5 per cent compared to a rise of 47.4 per cent in national income at current prices. Against this background, the proposal in the 1979-80 budget to raise *the surcharge on income tax from 15 per cent to 20 per cent, in effect raising* the highest marginal rate of income tax from 69 per cent (including surcharge) to 72 per cent, is no more than a symbolic gesture and certainly does not undo the damage done by the steep cuts in income tax rates effected in the budgets of 1974-75 and 1976-77. The same is true of the gingerly increases now proposed in wealth tax rates, which too had been drastically reduced in the 1976-77 budget.

The budget proposals for the coming year again are notable for the light *they shed on the government's rickety finances. Despite additional taxation* of Rs 665 crores (over 90 per cent of it through indirect taxes), of which Rs 460 crores will accrue to the Centre, the budget for 1979-80 starts with a deficit of Rs 1355 crores. Thus as against the provision for deficit financing of Rs 2226 crores in the scheme of financing of the Draft Five-Year Plan, 1978-83 during the entire five-year period, the Centre's deficit in the first two years alone is likely to be Rs 3500 crores, even assuming, most unrealistically, that the actual deficit in 1979-80 will turn out to be no higher than estimated in the budget. Despite this, the total provision in the 1979-80 budget for the Central Plan and for assistance for the Plans of the states and Union Territories is actually Rs 173 crores *lower* than that in the budget for 1978-79. Even the modest 13.2 per cent increase proposed in the size of the Central Plan in 1979-80 is entirely predicated on a 40 per cent rise in the availability of extra-budgetary resources for financing the Plan. Considering

[illegible] the expectation in this regard for [illegible] year is clearly unrealistic.

The Finance Minister has emphasised the significance of rapid advance in areas like petroleum, coal, fertiliser, iron and steel. However, the total outlay for industry and minerals in the Central Plan is just 8 per cent higher than that provided in 1978-79. This too depends, however, on the contribution from the internal resources of public sector undertakings going up from 22 per cent of the total outlay in 1978-79 to 37 per cent in 1979-80. Given the experience in 1978-79 with regard to the surpluses actually available from public enterprises and the sharp rise in the requirement of non-Plan loans to meet the cash losses of many of them, it is evident that the Plan for 1979-80 cannot be taken very seriously.

What stands out in the total picture is the government's increasing resort to the financial system to prop up its finances. Along with the massive deficits of the last few years — Rs 975 crores in 1977-78, Rs 2145 crores in 1978-79 and the budget estimate of Rs 1355 crores in 1979-80 — the government's net market borrowings have gone up four-fold in the four years from 1975-76 to 1979-80, from Rs 456 crores to Rs 1850 crores. The same growing recourse to borrowing to meet its expenditures has been characteristic of the private corporate sector as well, as manifested in the growth of bank credit to the commercial sector and the disbursements of the term-financing institutions. Clearly, the demand constraints arising out of the highly skewed income distribution and the abject poverty of the large majority of the population are sought to be loosened, in a painless manner for the rich, by all-round recourse to borrowing and credit.

China and Viet Nam

A Limited Encounter

A Correspondent writes:

EVEN before the war against the United States had been fully won by the people of *Indo-China*, the Soviet Union had extended its influence quite decisively over North Viet Nam, though, in the interests of the anti-US struggle, both North Viet Nam and the Provisional Revolutionary Government of South Viet Na[illegible]ntinued their public posture of eq[illegible]friendship with the Soviet Union and China. After the liberation of South Viet Nam and the reunification of the country, Soviet influence over Viet Nam was rapidly consolidated. [illegible] observer like Kathleen Gough, the Canadian anthropologist, has noted in her book "Ten Times More Beautiful: The Rebuilding of Viet Nam", an account of her visit to Viet Nam in 1976, that "despite an effort in public to deal even-handedly with all member-countries of what the Vietnamese still insist on calling 'the socialist camp', the Soviet Union was by far their most important ally in November 1976". According to her, "Soviet trucks, technicians and machinery were widely prevalent [in Viet Nam]. Soviet planes flew most frequently into and out of Hanoi. Thousands of Vietnamese students receive higher education in the the USSR". Faithfully following the Soviet line in international affairs, the Vietnamese government had applauded the leadership of Indira Gandhi and the proclamation of the State of Emergency in India in 1975.

On the other hand, Viet Nam's relations with China deteriorated rapidly. This was a complete reversal of the long history of the closest material and political support received by Viet Nam from China in its anti-US war. China has now charged that, as far back as in 1974, there had been 121 "armed provocations and incursions" by Viet Nam along the border between the two countries. Viet Nam's campaign to systematically drive out of the country people of Chinese origin, launched in 1977, could not but further exacerbate relations between the two countries. It has been estimated that about 160,000 people have been expelled from Viet Nam in this manner — most of them, significantly, from North Viet Nam. Since North Viet Nam has been socialist for many years, the Vietnamese government's claim that these people were fleeing the country because of its socialist measures did not appear very credible. China finally ended its economic and technical assistance to Viet Nam in July 1978.

The progressive tightening of Viet Nam's links with the Soviet Union received formal acknowledgement in June 1978 with Viet Nam joining the Council for Mutual Economic Assistance, which, except for Rumania, comprises countries completely subservient to the Soviet Union. Five months later, a delegation of the topmost Vietnamese leaders, including Le Duan and Pham Van Dong, went to Moscow and signed [illegible] treaty, [illegible] openly acknowledged [illegible] existence of 'military co-operation' between the two countries. This co-operation has been manifested in a steady flow of Soviet arms — including MIG-23 aircraft, rockets, and naval craft — as well as of Soviet military advisers to Viet Nam. The Soviet Union has also been using the Cam Ranh naval base in the Cam Ranh Bay in Central Viet Nam.

The reverberations of these developments were strongly felt within Indo-China. Viet Nam and Kampuchea had reached an agreement on the border between them as far back as in 1967. However, in 1976, the Vietnamese repudiated the agreement on the plea that at the time when it was signed they had been too preoccupied with the war against the US. This was followed by repeated military attacks by Viet Nam across its border with Kampuchea. Finally, on December 3, 1978, fortified by then by the Treaty of Friendship and Co-operation signed with the Soviet Union only the previous month, Viet Nam announced the formation of a so-called "Kampuchean national united front for national salvation". Apprehensions that this was a precursor to a full scale military offensive by Viet Nam to overthrow the Kampuchean government headed by Pol Pot were confirmed within weeks. On December 25, 1978 Vietnamese troops launched massive attacks on Kampuchea from several directions. On January 7, 1979, they occupied Pnom Penh and announced the setting up of a government of their creation. With this, and with a quiescent government already installed in Laos, Viet Nam could claim to have achieved for the time being at least, its long-time objective of an "Indo-Chinese federation" under its domination.

Against the background of this entire course of events, China's "counter-attack" across its border with Viet Nam could only have had very limited objectives. The most the Chinese could have hoped to achieve was to serve notice that in future Viet Nam could not rule out a military riposte by China to its "swashbuckling in Laos, Kampuchea or on the Chinese border", as Deng Xiaoping put it. It does not seem either likely or intended that the Chinese "counter-attack" will force Viet Nam to withdraw any of its troops from Kampuchea or that it will deal a

ANNUAL NUMBER

The Annual Number is under print and is expected to be ready by March 15. The printing of the present issue has also been delayed. The delay is regretted.

[illegible] ful, [illegible] though [illegible] exposing [illegible] of Viet Nam, China's operation may, therefore, indeed prove "limited in time and space", as stated by the Chinese government at the outset. And, for that reason, despite affirmations that it will fulfil its obligations to Viet Nam under the *Treaty of Friendship and Co-operation* and some demonstrative naval movements in the South China Sea, the Soviet Union is unlikely to feel called upon to intervene directly in the fighting this time. However, the invasion of Kampuchea by Viet Nam, the war of resistance against the invaders by the people of Kampuchea which is bound to gather momentum, the eventual people's upsurge in Laos against the stationing of Vietnamese troops there and the Vietnamese-backed government, the relations of bitter hostility between China and Viet Nam (two countries which had described themselves as being as inseparable as "teeth and lips" during Viet Nam's liberation war against the US) must all be accepted as the inevitable consequence of the Soviet Union's *efforts*, successful so far, to step into the shoes of the defeated United States and to emerge as the dominant superpower in the Indo-China region.

The Budget

City Bulls

THE share markets are not a barometer of the health of the economy, not even of the organised industrial sector, according to a twenty-two-year old dictum of T T Krishnamachari which no one believes in, thanks to the contrary view fostered by industry leaders. There precisely lies the rub. There is a boom on in the share markets which has leap-frogged the Charan Singh budget and broken into a run. Will the Finance Minister too reject the TTK dictum and refuse to relent on such proposed measures as the hike in surcharge on corporate and personal income tax or withdrawal of excise duty concession on incremental output of non-priority industries over 1976 levels or withdrawal of exemption from tax of capital gains invested in preferred assets? The bull fervour is certainly strong. Among leading shares which flared up between February 24, the day the stentorian Economic Survey issued the alert that high taxation was inevitable, to March 1 the day following the budget, are: Century from Rs 621 to Rs 684.50, Telco from Rs 267 to Rs 319, Gujarat Fertilisers from Rs 461 to 498, Indian Organic from Rs 304.50 to Rs 340, No- [illegible] boom [illegible] share markets witnessed a steady trend during 1978 as seen from the rise in even the *Economic Times* index of ordinary shares prices, which is not a sensitive index, by 20 points to 178 during the year ended January 5, 1979. But the current boom can hardly be traced to 1978. Till February 24, the index hovered around 174.4. True, some days before that date share prices had slipped partly in a process of profit-taking, but in retrospect it would seem it was a deliberate exercise by the bulls to lighten their commitments for the big killing. The *ET* index climbed to 176.3 on the day before the budget and shot up to 184.4 the day after the budget. This works out to a ten-point rise in a week. Even the withdrawal of exemption on capital gains is seen as a bullish factor on the ground that it would diminish sale of shares. All this despite badla, or carry-forward, charges rising reportedly to 18 to 24 per cent, or about double the usual levels. Clearly, the bulls are overbought. But no bear pressure of significance is likely to emerge, especially in Century which is said to be backed by really big operators. When it comes to the crunch, settlement would always be made outside the market in cash. It is a game among half a dozen operators and their cohorts, the brokers under the supervision of the stock exchange directorate of the Finance Ministry, with the financial institutions standing by with a load of public money to take up shares whenever their prices show a tendency to decline — a most effective price support arrangement. It is all very proper, for did not Morarji Desai say a decade or so ago that bull speculation was good?

Speculation is understandable, of course, but the question might still be asked if it can be sustained without any economic foundation. That precisely is it. The 1979-80 budget makes no structural change and underlying its false dichotomy between town and country, is the consolidation of a live-and-let-live arrangement for the rural and industrial business elite.

The Law

Imprisoned Undertrials

THE publication in *Indian Express* of a report by K F Rustomjee, a member of the National Police Commission, on the conditions of prisoners and undertrials in two jails in Bihar has led to some unexpected, but laudable, development. The report was followed in quick suc- [illegible] ly and without her being [illegible] by the undertrials to plead their case, the Supreme Court admitted the petition and directed issue of notice to the Bihar government on January 22; and two weeks later, on February 5, the Court issued orders for the immediate release on personal bonds of 42 of the undertrials in Patna and Muzaffarpur jails whose names had been published in the *Indian Express* report.

Surely, the sequence of events is remarkable. The Indian Press has had few significant achievements to its credit in recent times, whatever brave role sections of it might have played in the days before Independence. Even more than the publication of the report, the methodical and systematic way in which certain follow-up steps have been taken has been notable.

Welcome as these developments are, one has also to note that the fundamental facts highlighted by the *Express* report — that thousands upon thousands of poor and helpless persons remain incarcerated more or less indefinitely — might tend to be overlooked in smug affirmations of faith in the basic accountabilities and correctives built into the system. The events, if anything, have further underlined the urgency of penal reforms.

For consider their actual sequence. The first reports appeared on January 8 and 9, the Supreme Court issued notice to the Bihar government on January 22, and on February 5, it ordered the release "forthwith" of 25 undertrials in Muzaffarpur jail and 17 more undertrials in Patna jail. It also directed the state government to furnish by February 19 a list of undertrial prisoners lodged in the state's jails for more than 18 months, together with a description of the reference charts and the date from which they had been in jail.

And yet, on February 8, the superintendent of Patna Central jail was reported to be still awaiting the Supreme Court's order. On February 12, following complaints by the counsel who had first taken up the case of the undertrials that the Bihar government had not complied with its earlier order of February 5 and had not released the undertrials, the Supreme Court issued fresh telegraphic orders for the release of the prisoners. The apparent reason for the prisoners not being released, as argued by the state's counsel in the Supreme Court, was 'postal delay' in the delivery of the Court's orders to the concerned authorities. And on

February 28, while presenting the list of undertrials in the state as demanded by the Supreme Court, the Bihar government was still defending its practice of detaining under 'protective custody' women who, far from being accused of any offences, actually happened to be victims of offences on the ground that such detention was necessary to have them available for giving evidence at some remote date when (if at all) the case would come up.

But what the prisoners and undertrials have to endure is not merely (at best) apathy and (at worst) active torment from their captors. If one were to go by the observations of the Supreme Court, even the judiciary in the states is not as alert and concerned as it should be about the individual rights of those brought before it for committal. The Supreme Court pointedly asked the Patna High Court to make a detailed inquiry whether magistrates had been satisfying themselves, or were acting mechanically without applying their minds, while granting custody to undertrials from time to time over a period varying from two to ten years.

Clearly, the situation is one of callousness and worse, and what is called for is a complete exposure of the conditions in Indian jails, of the attitudes and behaviour of prison officials and lower judiciary without whose acquiescence it is inconceivable that a person could periodically be remanded to custody for years. But according to the Chairman of the National Police Commission, the most urgent reform in police administration that is called for is curbing of "interference in police functioning". Perhaps it is yet another instance of contraries co-existing that while the Chairman of the National Police Commission should hold such strong views on the need to crub "interference in police functioning" one of the members of the same Commission, by precisely such "interference" and by publicising the results of such interference, should have contributed, in howsoever a modest manner, to the mitigation of a very small part of the injustice and cruelties that characterise the administration of law in India.

West Bengal

War on Refugees

A Correspondent writes:

THE Calcutta High Court's order upholding the right of ingress and egress for Dandakaranya refugees who are entrenched on Marichjhanpi island in the Sunderbans, and restraining the West Bengal government from interfering with the supply of essential items such as drinking water, food, medicines and cloths, offers only a temporary respite for people who are being treated with extreme callousness, even brutality. The barricade thrown round the island amounts to an economic blockade. It is buttressed by police forces, forest department launches, administrative personnel and militant CPI(M) cadres. Reporters have not been allowed since January 27 to venture into a theatre where the Left Front is clearly trying to starve the refugees into submission. Two Marichjhanpi men who recently ventured into a neighbouring bazaar were promptly arrested.

New Delhi's condonation of these measures — evident from Morarji Desai's approving letter to Jyoti Basu — is hardly surprising. But why the Chief Minister should act with such extreme harshness while continuing to promise not to use force for eviction remains a mystery. No less enigmate are the circumstances surrounding the exodus from Dandakaranya, the number of people who have sought refuge in the Sunderbans, and the Left Front's adamant refusal to countenance their colonisation of an uninhabited wasteland

Most reports suggest a population of about 12,000, though Janata and Congress MLAs claim that at least 30,000 people have set up camp on Marichjhanpi, literally a basket of chillies, which is 30 miles long and only eight miles across. All observers agree, however, that refugees have brought prosperity — and without a paisa of aid at that — to this barren terrain. They have drained low-lying saline swamps, built bunds to protect the island, planted paddy, areca nuts and [illegible], set up fisheries, and taken to weaving baskets and fishing nets. A newly-installed tubewell provides potable water. In any other situation, these pioneers would have been commended for their effort and enterprise and recognised as frontiersmen pushing out the horizons of the habitable world. The refugees themselves maintain that, having come from the riverine districts of Barisal and Khulna, they find the Sunderbans climate and topography suitable.

Concern for the tiger's welfare was the first argument given for rejecting their claims. But Marichjhanpi lies outside Project Tiger's 2,585 square kilometre tract. The further plea that settlement would damage trees ignored the fact that only 40 per cent of the 9,626 square kilometre delta of the Ganga is notified as a reserve forest. In any case, it is highly unlikely that a Marxist regime would place tigers and casuarina above suffering humanity. There must be more convincing reasons for trying so frantically to vacate Marichjhanpi.

One explanation could lie in the fact that the Left Front relies heavily for votes on Muslims who comprise 25 per cent of West Bengal's population, refugees, harbouring memories of persecution in erstwhile East Pakistan, could arguably provoke communal trouble. Privately, government spokesmen plead that refugee settlement could exacerbate relations with Bangladesh and also lead to friction with an estimated 500,000 workers from Orissa, Bihar and Uttar Pradesh. But the charge of an unbearable economic burden does not hold water since these hapless people have not sought any assistance and have, in fact, demonstrated their ability to take thriving

root without [illegible]. In any case, Jyoti Basu has not ever asked for Central aid to rehabilitate this community which clearly indicates that he does not want to have anything to do with it.

More convincing is the suspicion of political antagonism. The dispossessed are always easy prey to opposition blandishments. The CPI(M) readily exploited the refugee vote in 1967 and 1969 by promising them an honourable deal in West Bengal; even Jyoti Basu on occasion explicitly promising that all those who wished to leave Dandakaranya would be accommodated in the state if ever he came to power. Congress and Janata politicians are now following precisely the same tactics with the result that yesterday's allies have for the CPI(M) become today's enemies. An uprooted people are again pawns in politics. Meanwhile, the Left Front is making no attempt at all to examine why so many thousands of people were forced to leave Dandakaranya, why they so firmly refuse to return, or to explain why it is so implacably opposed to settlement in the Sunderbans.

Accusations of foreign intervention lend a patriotic air to the government's strategy which is promoted by the bureaucracy for narrow social reasons. Namasudras, the lowest caste group in East Bengal, comprise the present wave of refugees; the Brahmins, Vaidyas and Kayasthas who traditionally dominate the civil service and professions have no sympathy with their plight.

Presumably, the government will succeed in its objective. The High Court has allowed it to take adequate steps to maintain law and order and preserve and protect official property. The Order also allows the government to prevent an influx from Bangladesh while encouraging those who wish to leave Marichjhanpi to do so. As part of this last clause, refugee organisations have been told not to deter evacuees.

All this can cynically be interpreted to justify various forms of social, economic and political pressure exerted by the powerful machinery of governance. But even if the Marichjhanpi community succumbs to the seige and blockade, as it probably will, the victory can only reflect discreditably on a Ministry that claims to represent the underdog.

LETTERS TO EDITOR

Time to Make Choices

FURTHER to the debate on taxation, Ashok Mitra says (January 27) that, as Finance Minister of West Bengal, he has almost no power to impose direct taxes on the rich but that he must perforce tax the masses of the poor through indirect taxes, lest the state should go bankrupt. Two conclusions emerge: (1) Ashok Mitra identifies the increased role of the bourgeois state with the people, and (2) he views his specific function as that of ensuring the stability of the social function of the state in order to perpetuate the exploitation of the masses. He could, however, directly tax the rich if he got enough powers from the Centre, he adds; and that is how Centre-state relations enter the picture.

Here Ashok Mitra gives a 'democratic progressive' twist to the debate. CPI(M) is never known to have raised the issue in this manner. The problem of taxation is very much an all-India one and not one of West Bengal alone. To say that class relations and Centre-state relations are interlinked is one thing; to give prominence to Centre-state relations, implying that not class relations but primarily Centre's discrimination against West Bengal is the root cause of West Bengal's miseries, is quite another. And this is precisely what the CPI(M) does to avoid the class question and safeguard middle class votes.

This is both false and dangerous. It isolates the Bengali working class from the rest of India, breeds chauvinism and puts the cart before the horse. Unequal class relations inevitably engender unequal Centre-state relations in a multinational state consequent upon uneven development of capitalism. Only with the abolition of classes will the unequal relationship go.

These apart, supposing Ashok Mitra had the power, had the absolute majority in Parliament, could he do what he promises to do with the army, bureaucracy and property relations remaining as they are? When Lenin set the tasks for the Left Zimmerwaldists to rescind all indirect taxes and tax the rich direct instead, he was not taking a functionalist-legalist approach knowing as he did the lessons of history.

Ashok Mitra's letter turns out to be more interesting for its confirmation of our understanding of his policies than for the illumination it offers. The conjunction of angry wit in flatulent prose with severely opportunist principles is, after all, hardly a rarity in revisionist culture. Not for nothing did Lenin make it a compulsory duty for the revolutionary people to cultivate hatred for the pseudo-Left.

Playing the Imperialists' Game

IN and out of parliament, a loud cry is being raised against Chinese 'aggression' against Viet Nam. The pity is that Viet Nam's own aggression against Kampuchea is conveniently glossed over. Why this double-standard? India has not obviously forgotten or forgiven the Chinese forward armed thrust of 1962 in spite of its new desire for restoration of normalcy in Sino-Indian relations. More, India is as much of a client of the USSR, financially and militarily, as Viet Nam in whom the former has found a natural ally in subservience which goes by the respectable name of 'friendship'. Friendship, indeed ! Was it not the so-called treaty of 'friendship' with the USSR which had emboldened India in its military venture in the then East Pakistan as much as it now has emboldened Viet Nam in its military thrust into Democratic Kampuchea? If the people of Kampuchea were unhappy with the Pol Pot regime, it was nobody else's business but theirs to overthrow it. But why did Vietnam send as many as 14 army divisions into the Kampuchean boundary and why are 20,000 of its soldiery armed with the Soviet-supplied military equipment present on the soil of Kampuchea even while India is shedding tears over Vietnam's fate? The human rights record of USSR is no better. Ours is hypocricy at its worst. Viet Nam's bid for regional hegemony in Indo-China is not very different from India's own ambition for hegemony over the sub-continent. And the pity is that both Vietnam and India are playing the game of the super-hegemonoists at the cost of their real sovereignty.

Marketing Role Not Appreciated

Hansavivek

VOLTAS has shown greatly improved performance during 1977-78 compared to the very disappointing results of the previous year and has stepped up dividend by 5 points to 12 per cent. Net sales have increased from Rs 156 crores and gross profit is up from Rs 67 lakhs to Rs 186 lakhs. Net profit is Rs 105 lakhs (Rs 10 lakhs) and the dividend is covered nearly 1.3 times. This outcome is attributed to revival in demand for certain products such as consumer durables and pesticides, stricter and more effective controls over expenses and better management of financial resources. However, a number of factors continued to operate hampering the return to the higher levels of profits attained in the five years from 1969-70. Demand for mining machinery continues to be low; the interest burden remains heavy; payments from government are inordinately delayed. The settlement of the charters of demands of employees at Bombay and at most of the branches has, according to the management, added over Rs 60 lakhs to staff costs, but the hope for increase in productivity has not yet materialised. The company's export billings increased by 42 per cent to Rs 5.79 crores and the management is now concentrating more on seeking project orders and on providing consultancy service in various fields such as textile mills, airconditioning and refrigeration, tubewell drilling, electrical sub-stations and water management. During the first four months of the current year, the company's turnover has been 27 per cent higher than in the same period last year. Gross margins, though significantly better, have not kept pace with the increase in sales. The overall performance during the current year is expected to show further improvement. While the order book position is generally good, there is as yet inadequate demand for mining equipment, forklift trucks, and water/air pollution equipment. The management's increased emphasis on rural marketing, agricultural input, turnkey projects and the use of newer technologies is beginning to yield results. The chairman, Akbar Hydari, has expressed concern at certain recent instances where newly established undertakings have been directed by financial institutions from whom they obtain equity or loan funds that their marketing arrangements with organisations such as Voltas should be of short duration and on specified terms. Hydari points out that such directives which go beyond statutory or reasonable limitations are not fair either to the producers or to the marketing organisations appointed as distributors or selling agents, even though not on an exclusive basis. He contends that the development of a market for the products of a newly established enterprise is a long and arduous task, especially where after-sales service is involved.

CHEMICALS AND FIBRES OF INDIA's profits declined for the second year in succession. Profit before tax amounted to Rs 2.30 crores in 1977-78 compared to Rs. 2.94 crores in 1976-77 and Rs 4.34 crores in 1975-76. This situation resulted largely because

imports of polyester fibre were allowed to be made freely by textile mills. For most of the year fibre was offered by suppliers in the Far East at very low prices. Not only were prices depressed but sales tonnage was also affected. This in turn led to increase in inventory levels as well as debtors and consequently interest charges increased considerably. Profit after tax came to Rs 70 lakhs (Rs 99 lakhs). Dividend was reduced from 15 per cent to 10 per cent. Demand for black fibre, a premium product introduced in 1976, was brisk and enabled the average realisation to be improved somewhat. Towards the year-end, foreign suppliers increased their prices which gave a measure of relief to the indigenous industry, although presence of a large stock of imported fibre with textile mills and local fibre with Indian manufacturers continued to depress price levels. According to the chairman, A L A Mudaliar, at present the company is selling its fibre at around Rs 70 per kg, inclusive of Rs 41 per kg excise duty, as against the landed cost of the imported fibre of Rs 70 per kg. The company has been issued an industrial licence to expand capacity from 6,100 tonnes to 10,000 tonnes per annum. This will cost about Rs 2.5 crores and is proposed to be financed by internal resources. Other polyester fibre manufacturers have also been allowed to step up capacities. CAFI's expansion cost per tonne would be the lowest among all manufacturers. The future outlook for the industry will depend on government's decisions on the investigation carried out by BICP on the cost structure and on the recommendation of the committee appointed to recommend future import policy and degree of protection required by the Indian industry.

TRIBENI TISSUES experienced a marked contraction of margins during 1977-78 despite higher production and sales. With additional production of 2,600 tonnes from the new paper machine in spite of frequent load shedding and teething troubles, sales at [illegible] tonnes were 20 per cent higher than the previous year's 7,641 tonnes and its value increased by 31.3 per cent from Rs 10.24 crores to Rs 13.45 crores. Better product-mix and "marginal" price adjustments notwithstanding, however, gross profit could look up by a mere 6.3 per cent from Rs 2.04 crores to Rs 2.17 crores. With depreciation requiring more, profit before tax turned out to be actually lower at Rs 1.35 crores (Rs 1.48 crores). Even so, dividend has been raised by a point to 15 per cent. After transferring Rs 48 lakhs to investment allowance reserve, distribution was slightly short-earned. There was no tax liability on the profits, as in the previous year, on account of benefits arising from the new investment. The company stepped up exports from Rs 1.41 crores to Rs 2.30 crores despite severe competition from European suppliers and withdrawal of export subsidy with effect from July last. Bulk of increase was due to export to Pakistan. Efforts are being made to further extend the scope of exports with the introduction of medium and high porosity papers as well as marking press cigarette tissues, now being developed.

Lobbying Foreign Policy

Romesh Thapar

WITH a certain degree of sadness one has to admit that it is becoming too easy to predict the reactions to international events from our political figures. So many of them are now unashamed lobbyists for this or that power group, or simplistic nationalists when it comes to asserting India's interests. All this lack of health has been underlined by the crude Chinese attack on Viet Nam even as our foreign minister was on the last lap of his 'normalising' mission to Peking.

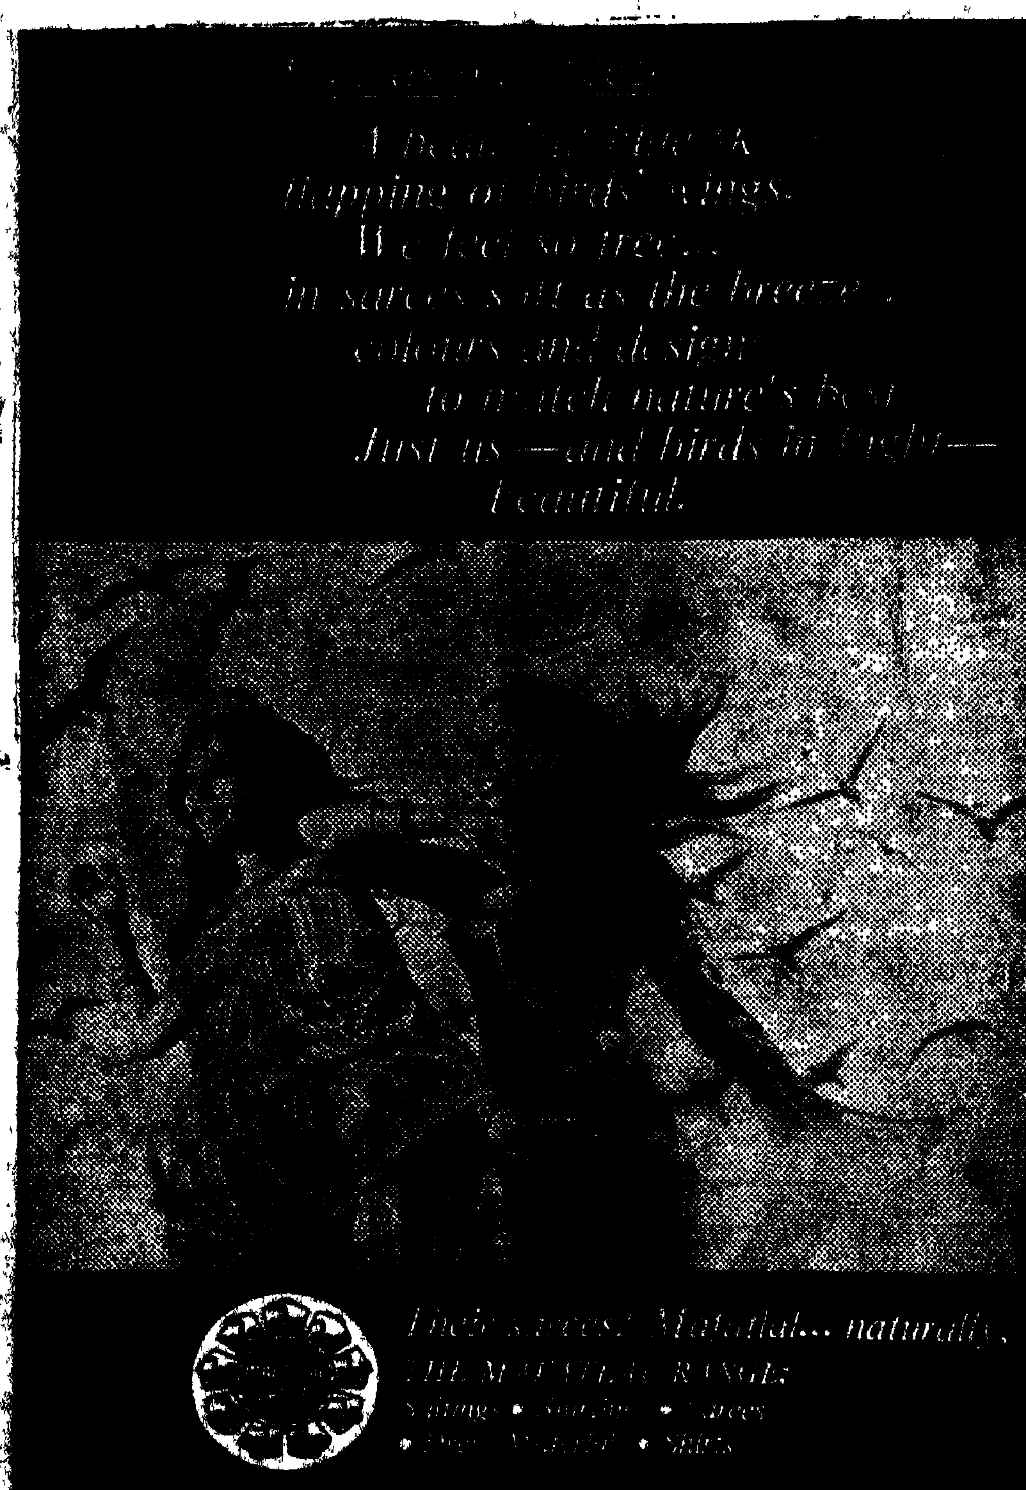
All manner of irrelevant theorising, from the banal pro-Chinese statements of the CPI(M-L) — whatever that might represent today! — to the expected pro-Soviet CPI-ist responses and on to the pro-US equations of Subramaniam Swamy, a somewhat recent recruit of the RSS, leaves the Indian people in a fog of confusion laced with anger. This was best seen recently when some gathered to express solidarity with Tibet and started fighting between themselves — and at a time when the whole of Asia is fearful of China's aggressive posture.

This is not to suggest that we are the only sufferers in times of crisis. Oil pressure can persuade the British queen to don ankle-length skirts on a visit to Saudi Arabia (why not a burqah?) and the once-pampered Shah is beginning to wonder whether any Western country will give him sanctuary. Indeed, the Western world is so far gone that it is prepared to do anything to preserve its comforts and living standards.

We bumble along unable to decide what to say about Viet Nam's intervention in crushing the loathsome Pol Pot regime in Kampuchea when we should have stated in clear-cut terms that this Chinese-backed aberration was bound to be rejected and need not have invited Vietnamese attention. A frank recognition of the new regime after it had established itself would have blunted the Chinese attempt to divert attention from its blatant bullying of Viet Nam. Now we are wondering whether to recognise the new government of Kampuchea, and even as we belatedly denounce the Chinese attack on Viet Nam as aggression.

Why should we not be more principled? Why can't we draw the distinction, as we see it, between what Viet Nam did in Kampuchea, and what China did in Viet Nam? Can a regional confrontation be equated with a continental threat? It would, at this critical time, help us to take initiatives to defuse these tensions which only turn Asian lands into arenas for trials of strength in the interests of those who play the global power game. And China is becoming such a player, the chatter notwithstanding.

The Indian view, if it is to make any sense in today's situation, must be conditioned by our growing interest in building a structure of co-operative effort in South and South-East Asia, using existing organisations like ASEAN, and, of course, the new presence of Viet Nam. Our Chinese gambit from the Delhi end is only intended to dissolve a harsh 18-year-old confrontation over borders. It can never attempt, in the Nehruvian sense, the fashioning of Asian Security and stability on a Delhi-Peking axis. The Asian scene is much changed, and needs a great deal of new thinking whatever the innocent non-alignists might think.



The slow take-off in these areas, conditioned largely by our prevailing complexes about reactions in the US and the USSR (and even China!), is encouraging a panicky western world to counter Iranian events by a renewed arming drive in West Asia and in Pakistan. Nothing could be more disastrous to the interests of Southern Asia, and upon India falls the major responsibility to make this known in no uncertain terms in the capitals of the West. The effort calls for bold initiatives, particularly on the sub-continent, to dissolve the remaining suspicions which tend to encourage us to take to matching exercises in military expansion — assisted, of course, by Chinese chauvinism and by Islamic aberrations.

Nothing infuriates more than the attempt by very obvious lobbyists to force Atal Behari Vajpayee on the defensive about his China visit. This is partially a crude attempt to soften him up for the scheduled Kosygin talks in the first week of next month. India has to pursue the road to normalisation with China whatever the complexities in Peking's behaviour, remembering that the economic and political manipulations in the northern hemisphere need some solid countering in the southern lands. The romanticisation of friendships is a costly business. Let's keep them hard-headed, coldly calculated, but designed to serve the ends of peace, self-reliance and just development.

We watch the mounting battles on the China-Viet Nam frontier, the tensions building in neighbouring Pakistan over the Bhutto trial, the elections in Bangladesh of notorious collaborators who worked for Pakistan, the killings in Afghanistan, and the growing rumpus between the radicals and the religionists in Iran. Tremendous changes are taking place in southern Asia, but leadership at this crucial moment is far from coherent. A wild striving for some diffused objectives is the common pattern. This current upsurge will ultimately find some tangible form and a new balance of power, but India cannot lose itself in a tangle of old concepts and theories which have little relation to these realities.

The China-Viet Nam collision, short-lived or protracted, will mark a qualitative change in South and South-East Asian alignments. Even as the tormentors of the Foreign Minister are muffled by the careful emphases of his skilful speeches (for it is words we believe in more than anything else!), the situation in the Asian continent will need intelligent handling. Here, speeches alone will not be enough. Atal Behari Vajpayee had better get himself solidly equipped with what Asia thinks, or else he may find himself on even more slippery ground — with the lobbyists in full blast.

India's Economic Crisis: Dialectics of Sub-Imperialism

Ranjit Sau

INDIA is in crisis, in every sphere, social, political, economic. About the economic crisis, broadly four alternative theories have been advanced so far. (a) According to one of them, this is a Ricardian crisis, with a little bit of Malthus thrown in. With the growth of population, more and more marginal land has been brought under cultivation, costs of agriculture have risen, so have prices of agricultural goods. Landowning rentiers have benefited; and industry has been suffering under the weight of rising costs and hence falling profits (b) The second theory blames the terms of trade which have tilted in favour of agriculture as the economic and political hold of the farm lobby has gone up in recent years; savings have fallen, and industry is up against the wall of limited home market. (c) The third theory finds the root of the crisis in the very nature of the mixed economy of private and public sectors, where the government buys the inventory of the private sector and thus places a large sum of liquid funds in the hands of the private sector. Massive procurement of foodgrains, and large-scale export subsidy are cited as examples of such official operations whereby the private sector manages to dispose of its inventory quickly. Such a situation is prone to speculative trade and inflation. (d) The fourth theory correlates the present economic crisis with the slow demise of public sector's investment.

Various combinations of the above four are possible. But, one may ask, what is the nature of the present crisis in the first place? Is it just a cyclical crisis, perhaps a little more prolonged this time than the earlier ones? Or, is it a more basic, deep-rooted problem? First this question has to be settled. It appears to us that the Indian economy has fallen in the grip of a fundamental crisis Previously, the economy suffered from cyclical fluctuations in line with the agricultural cycle which also induced a similar pattern on the front of foreign exchange resources. But this time, one finds a structural break. A huge buffer stock in foodgrains and a rising reserve of foreign exchange have failed to spur the economy into action. This disjunction is a symptom of an inner malaise of the economy.

What is a fundamental economic crisis, as distinct from a cyclical one? A fundamental crisis arises out of, and intensifies, the major contradictions in the sphere of production, rather than those in the sphere of circulation. To clarify, in the wake of a poor harvest the demand for industrial goods may fall; this is an instance of a temporary problem in industry, not a basic one. But if the monopolists restrict their output and thus cause stagnation it is a basic or fundamental malady of the system

I

The school of underconsumptionists has a long tradition. Rosa Luxemburg took it to its absurd limit that denies even the very possibility of capitalism, while Keynes is an infinitely more optimistic member But underconsumption is not a peculiar attribute of capitalism; it is there in every exploitative mode of production. At any rate, the thesis of underconsumption locates the problem of crisis mainly in the sphere of circulation rather than in production as such. It has a tendency to quickly degenerate into social democrat reformism. If underconsumption — the lack of purchasing power of the consumers — were a crucial problem of the Indian economy, a Keynes could have jolly well nursed it back to health and vigour.

This is not to deny that the limited home market is a constricting factor for capitalism in India. What we would like to emphasise is that the inelastic home market is more of a *manifestation* of the crisis than its *cause*. Similarly, the lack of investment in the economy is a manifestation, not the cause.

As for Ricardo, we can dismiss him quickly. During the last decade, over four-fifths of the additional agricultural output had been produced by the kulaks with the so-called new technology, where the private cost of production per unit of output is certainly lower than before. Technological change can keep both Ricardo and Malthus at bay.

The 'liquification of stock' theory, the third one above, has read the charts upside down. It is the opposite of the underconsumption thesis. If it were true, if the private sector had no difficulty in liquefying its inventory stock, production should have gone up, instead of staying put or declining. Besides, the massive buffer stock of foodgrains or foreign exchange reserve is only a recent phenomenon, barely two or three years old. How can it explain the stagnation of over a decade?

II

As capital accumulation proceeds, some capitals grow faster than others. This is called *concentration* of capital. Some capitalists move far ahead than others. Concentration of capital is a function of the growth rate of accumulation. If the growth rate of accumulation is zero, the process of concentration of capital ceases. There is another, somewhat similar, yet quite distinct, phenomenon, which is known as the *centralisation* of capital. When accumulation reaches a certain stage, individual capitals turn against each other, bigger ones eat up the smaller fries, and become still bigger. This happens even if the growth rate of accumulation in the economy as a whole falls to zero. In fact, concentration and centralisation of capital are the two distinct processes which go on simultaneously in the capitalist economy; but in some stage one of them becomes the dominant feature, in another the other one emerges as the stronger force. Usually, centralisation comes into operation at a later period when the level of accumulated capital has reached a certain height, and during the period of centralisation the overall growth rate of accumulation in the economy is rather low. Big capitals then feed themselves upon small capitals, instead of accumulating through realisation of surplus value in production. All this is not new, re-read "Capital", vol I (Moscow, 1965), pp 624-28.

In the two decades of fifties and sixties, India's big bourgeoisie had come of age. Drive for industrialisation, import substitution, subsidising public investment — it was the heyday of private capital; accumulation went by leaps and bounds, concentration was the order of the day. Big became bigger; small ones also basked in the sun of official policy. But soon, true to its nature, capital turned against capital. MRTP Act in the late sixties was more

[illegible] nature of window-dressing, or at a feeble attempt to turn the tide. [illegible] not matter. You can capture [illegible] capital by a benami holding of mere twenty per cent of shares of the [illegible]. There are other ways of amassing small capitals. Instead of producing in your factory, you tie up a number of small capitals and get it done through them, but you appropriate the surplus value. Perhaps there are also other secrets of the trade. "Commensurately with the development of capitalist production and accumulation there develop the two most powerful levers of centralisation — *competition* and *credit*. ... The credit system, which in its first stages furtively creeps in as the humble assistant of accumulation, drawing into the hands of individual or associated capitalists, by invisible threads, the money resources which lie scattered, over the surface of society, in larger or smaller amounts, ... soon becomes a new and terrible weapon in the battle of competition and is finally transformed into an enormous social mechanism *for* the centralisation of capitals". (*Ibid*, p 626; emphasis added). One knows how the credit system works in India.

Competition among capitals became fierce. Sick inefficient production units were quickly jettisoned, and the government policy came in handy. The so-called 'concentration ratio' as measured by many in our profession might have *gone down*; but the big bourgeoisie, unburdened of excess baggage, turned all the more strong and fearsome.

During this phase of centralisation, in the seventies, productive investment is not on the *agenda* of the big bourgeoisie; it is bent on grabbing other capitals. This is one of the *causes* of the present crisis of Indian economy. [illegible] intense conflict *among* the Big Houses, and *between* the Big [illegible] on the one hand and smaller capitals on the other is there for all to [illegible]. This goes a long way also to explain the emergence of the Janata Party, [illegible] and growth of Congress (I), [illegible] the likely continuing battle of the [illegible] for some time to come.

[illegible] Houses are vying with each other to divide up the Indian economy among themselves, just as on the world scale the imperialist capitals did at the turn of the century and thus led to World War I. With a little exaggeration [illegible] can say that some of the major [illegible] that were underlying World War I are, in a reduced scale, at work today on Indian soil. India today also reflects some of the traits of the world prior to World War II. The spectre of fascism is on the rise; while the forces of socialism are also going through a difficult drill of reorganisation and preparation. The analogy, however, should not be taken too far.

III

The imperialism of India's bourgeoisie is a sub-imperialism, under the shadow of super-powers, who *are contending* with each other to keep India under their wings. The conflict among the Indian bourgeoisie cannot therefore reach a flash point. Live and let live, forgive and forget, this will be their motto after a few rounds of firework. In five or ten years the line between Janata and Congress (I) will become blurred, if not non-existent.

But the inexorable law of capitalism — concentration and centralisation of capital — will work on. The crisis of the Indian economy will appear again and again. More so, because after all the home market is not expanding fast enough. Feudal and semi-feudal relations in agriculture are a barrier which the weak capitalism of India cannot pierce. In fact, it is a triangular arrangement — feudal and semi-feudal landlords, big bourgeoisie, and imperialism, these three hold the Indian economy in their grip. Keynes would find such a land totally foreign. With or without the help of a Keynes or Friedman, the present crisis of [illegible] would blow over sooner or later. Though it is a fundamental crisis, it would be an illusion to think that the Indian economy is on the verge of a breakdown. One need not be surprised if, after the current turmoil of reorderin the assets, capital comes out even stronger than before, ready for another phase of ruthless self-expansion, to be followed by the next round of centralisation. One set of contradictions is resolved only to give rise to another set at a higher plane; thus the system moves.

Be prepared for the days ahead. After all, there are always *weakest links* in the chain; Indian sub-imperialism is no exception. Classwise, the weakest link in the chain of exploiters is the feudal and semi-feudal landlords, whose interests do not square up very much with those of the other two in the ruling alliance. Geographically, the weakest links are those regions where productive forces have not yet developed or are languishing for one reason or another, where the local bourgeoisie is weak or absent. This statement must be qualified with the observation that in the era of imperialism and sub-imperialism, the contradictions between productive forces and production relations, and between the base and superstructure, assume a global characteristics, it would be futile to look locally for conflict or correspondence. The weakest links are to be correctly identified, and there the assaults have to be launched

Socialism by One Country

GPD

THE inevitable has happened. Deng Xiaoping has moved his men to carry out the punitive action. Deng's language was never his strong point. He has now demonstrated that his actions can be as rough as his language. There was a time when political analysis used to speculate when and if the Chinese would enter the Vietnamese embroglio. It has happened now except that 'the American imperialists and their running dogs' were thrown out of Saigon a good four years ago. Remember that phrase of the 1960? Nobody uses such quaint and obsolete phrases any longer. The socialists in Moscow do occasionally talk of imperialism but usually avoid naming the Americans (see Brezhnev's report to the 25th Congress of the CPSU). The socialists in Peking think that Soviet social imperialism and its allies are the number one problem today.

The Chinese have moved in Viet Nam — a fact not very easy to comprehend. Deng Xiaoping had notified the world about it not so long ago; yet it appeared that the final step may, after all, not be taken. It was quite customary for the Chinese foreign policy makers to make big noises. But they usually stopped short of actual involvement. Deng Xiaoping has introduced a new element in Chinese foreign policy. For the first time in their history the Chinese armies are active in a territory which by their own admission does not belong to them, without any apparent and immediate security threat. In Korea the danger of McArthur and his men crossing the Yalu was not at all unreal. In 1962, when the armed conflict between India and China took place, there was a border dispute and the Chinese armies were active in an area which they claimed as theirs and their adversary knew this. In Viet Nam, however, they are on indisputably Vietnamese soil. This is new and unprecedented in the history of China's foreign policy. The pattern of Chinese behaviour has changed. One does not quite know how and why. This was inevitable, Deng might argue, and the inevitable cannot be resisted for too long.

It is for this new pattern of behaviour, if for no other reason, that the Sino-Vietnamese war has to be seen and understood as *sui generis*. It is no use linking it with the other three wars or battles (Korea, Sino-Indian war of 1962 and the Sino-Soviet hostilities of 1969). What has made the Chinese bring about such a drastic change in the conduct of foreign relations? That is the crucial question regarding the present hostilities.

False Equation

But before we answer that it is important to point out that the equation sought to be established between the 1962 and 1979 hostilities is entirely false. For one thing, in 1962 there was a border dispute. The Chinese wanted to and succeeded in enforcing a *de facto* solution to the dispute and then withdrew. There does not now appear to be any real possibility of altering the *de facto* alignment of the Sino-Indian border. Brave statements on the question will continue to be made in India but the hard fact is that although India might over a period of time secure minor adjustments here and there, there is no question of the Chinese, for example, giving up the Aksai Chin or the road that they have built in the area. In short, there was a clear definable territorial content, a definable objective, to the hostilities then. There is no such problem as far as the Sino-Vietnamese hostilities are concerned.

For another, Viet Nam is an ally of the Soviet Union. That places Viet Nam today firmly on one side in the Sino-Soviet cold war. India was not so aligned in 1962. Maxwell might argue that India was itching for a confrontation with China. But even he has not suggested that India was in the imperialist camp as the Chinese understood the term then. The 1962 conflict may never be adequately explained. But surely it does not help our understanding of the events of 1962 to suggest that what has happened in 1979 is something similar to what happened in 1962. The comparision might help us to bask in the glory of anti-imperialism of which the Vietnamese have been and are a solid example. Our anti-imperialist record is dubious by comparison. Many people in this country seem to hope that by relating the two conflicts some glory might, after all, come our way. A clever calculation no doubt, but not very useful in understanding

Teaching Lessons

Ever since the late sixties the socialists of the world seem to have established an extraordinary pattern of behaviour among themselves. To use a rather ancient and tried expression, contradictions between peoples are now being treated as antagonistic, as compared to contradictions between the people and the enemy! The Soviet Union moved in great force to teach a lesson (although to be fair to the Soviet Union its leaders did not use such language; they concentrated, instead, on the question of sovereignty) to Czechoslowakia in 1968. Later in 1969 they did the same to the Chinese on the Ussuri. Last year by no means ideal government of Pol Pot was taught a lesson by the Soviet Union and Viet Nam. Now Deng Xiaoping has done the same to the Vietnamese. Of course, there are differences. Not all these cases are identical. The details are different. But the basic fact is the same. "In my area of socialism, I decide the norms." That is the logic. It is no longer socialism in one country. It is socialism by one country.

The Sino-Soviet feud has long gone beyond the ideological questions. Lean to one side, Brezhnev and Deng Xiaoping seem to say, but let that side be mine. Otherwise I will take punitive action. One can make too much of Deng's phrase of punitive action. But the Soviet action in Czechoslovakia and on the Ussuri or Viet Nam's in Kampuchea was no less punitive in character than Deng's action in Viet Nam today.

Who aligns with whom is the issue. Pol Pot's major error was not that he ran a totally incompetent government. His error was that he sided completely with the Chinese. The Soviets and the Vietnamese taught him a lesson last year. Now it is the turn of the Chinese. The socialists can sometimes be quite thorough in such matters.

Alignment is All

The point simply is that the issue of alignment is being sought to be settled. The Chinese cannot settle it in their favour in Viet Nam. The Soviet Union was able to do so in Kampuchea. It not only overthrew the Pol Pot regime, but also demonstrated that the Chinese cannot be a very credible ally. A superpower can act in a way in which the Chinese would never be able to act not for some time anyway.

Chinese have now moved into Viet Nam perhaps to demonstrate that the Soviet cannot be a very reliable ally either. This is the major blunder of the Chinese calculations in Indo-China. The credibility of the Soviet Union (in power terms) has already been demonstrated in Kampuchea. The Chinese cannot undo what has been done in Kampuchea. The Soviet-Vietnamese success there cannot be undone by moving into Viet Nam.

It is a classical power game that is being played in Indo-China. Deng Xiaoping and his comrades obviously thought that something can and must be done to retrieve their position in Indo-China. This is how the nation-states have always behaved. Deng's China is no exception to the rule.

The pity of it all is that the Chinese had opened their attack on the Soviet Union in the early sixties precisely on the premise that social-imperialism and revisionism are related phenomena. During the past few years there is a grand revision of verdicts going on in China. Chairman Mao, who was held responsible for 'anti-Sovietism' by the comrades in Moscow and their followers all over the world, ironically appears in retrospect easily the most moderate Chinese leader in his responses to the Soviet moves. He might have been anything, but he was not a Han chauvinist. One is not so certain of Deng Xiaoping. It is unthinkable that Mao would not have understood the significance of Viet Nam.

Indeed, there is evidence to suggest that the Great Helmsman of China understood that. Replying to a discussion on Viet Nam which seems to have centered around the possibility of a Viet Nam neutral between China and the Soviet Union — or even an outright pro-Soviet Viet Nam — Mao in his cryptic sort of way said that Viet Nam was like a Buddhist temple having four abbots distributing four different things. The significance of this was clear. An exception has to be made even if Viet Nam were not quite neutral as between China and Soviet Union. Viet Nam's abbots will occasionally dish out one thing to Moscow and another to Peking. But so be it, for Viet Nam has made an anti-imperialist revolution.

A Great Revision

The modernisers of the Deng variety do not believe in such simplistic and peasant-like formulations. They, like their counterparts everywhere else, believe in power. A great revision is going on in China. It is not altogether impossible that the new adventurism in Chinese policies and thinking is related to this revision. The Chinese were right in linking revisionism and big power chauvinism. They did not have to demonstrate the linkage themselves. China of the early sixties appears to be so distant today — one more reason perhaps why one should not confuse 1962 and 1979.

But then all this still does not answer why and with what objective the Chinese have moved into Viet Nam. After all, to get into a war of this kind, one has to have a definite objective. What are, after all, the Chinese demands? To force the Vietnamese to the negotiating table? But to negotiate what? Do they want to occupy the northern provinces? Not a plausible objective, for they cannot retain them, and the Chinese know this. Do they hope that through an operation of this kind they can alter the situation in Kampuchea? That does not seem likely either. The new Kampuchean government which is a creation of the Soviets and the Vietnamese cannot simply disappear by throwing a few punches at Viet Nam. Besides its future cannot be determined in Hanoi alone, even if it were a purely puppet government. Moscow is another capital which the Chinese cannot simply wish away. Are the Chinese, then, trying to establish a *de facto* solution to the problem of the disputed islands in the South China Sea? That is not very likely either because such a *de facto* solution already obtains on the ground. What then are the Chinese seeking?

All normal power considerations thus do not suggest an answer which would, in operational terms, explain the Chinese move. Against this background the Chinese moves appear to be simply acts of desperation undertaken in total disregard of consequences. They had not acted so irresponsibly before. Further the Vietnamese are as tough as, if not more than, the Chinese. The Chinese may therefore have bitten more than they can chew. Let us wait and see.

ASSAM

After the Raid

Udayon Misra

WHEN in June last year the chief minister of Assam declared the Doyang Reserve Forest in the Golaghat sub-division open to settlement, the move was widely welcomed; for, already about 12,000 families, mainly of Ahom, Chutia, Bodo, Kachari, Mikir, Miri, Nepali, Naga and ex-garden tribes, were living in the area. In the last general elections 35 polling centres had been set up for about 24,000 voters; and there are 106 primary schools, three high schools, 11 ME schools as well as two health centres in the area. For all practical purposes the area had ceased to be a reserve forest and indeed it was the chief minister's Socialist Party that had spearheaded the movement for getting the Reserve Forest declared open to settlement. The movement even had its martyrs when in 1973 two students, Gajen Ingty and Putul Saikia, were killed in police firing at Bhurbandha in Nowgong district.

According to Assam chief minister, the Doyang Reserve Forest area was never a 'disputed area' although in the 1972 interim agreement reached with the Nagaland government, the Assam government had agreed "that the Desoi Valley Reserve Forest and Doyang Reserve Forest shall continue to be reserve forests and maintained as such". Today Golap Borbora (who has inherited that agreement) is being accused of violating the 1972 accord not only by the Nagaland chief minister but also by Congress legislators of his own state who maintain that having opened the Doyang Reserve to settlement, the Janata government offered enough provocation to the Nagas to raid the Assam villages. To be fair to Borbora, one has to grant that by opening up the Doyang Reserve to settlement, he was only giving recognition to a *de facto* situation. Indeed, both the Congress parties which are now trying to capitalise on the situation may with equal justice be accused of having 'surrendered' Dimapur, the capital of the Kachari Kingdom till the middle of the sixteenth century, to Nagaland because of Central pressure and of 'bequeathing' the border problem to the present government.

Whatever be the immediate provocation behind the January 5-6 raids, in scale, intensity and planning the raids seem to have been unprecedented. The pre-dawn attack which was mounted from the Naga villages of Pohoto, Chitoi and Gonovi covered about 50 villages in the South Nambor, Rengma and Diphu Reserves. Over 500 huts were burnt down by the first wave of attackers who were followed in the morning of January 6 by smaller bands of raiders intent upon collecting loot from the villages already destroyed. Entire villages were razed to the ground and the inhabitants were either mowed down with gunfire or hacked to death. The entire operation was carried out in a most brutal manner with not even old people, babies and pregnant women being spared.

The attack broadly followed the historic pattern and execution of Naga raids on the plains of Assam in Ahom and British times. In earlier Naga raids too there were indiscriminate killings, with neither women nor children being spared. The discussion and acceptance of the plan of attack by the village elders, the spontaneous participation in the raid by almost all the menfolk and the manner of the killing — all these fit into with the pattern of traditional Naga raids. Even the timing of the attack — pr-dawn — conformed to the traditional pattern.

According to some eye-witness accounts, a sizeable section of the raiders included men in uniform and this had led to the initial confusion regarding the involvement of Naga 'hostiles'. But the discovery of some Nagaland Police epaulettes and badges in some of the affected villages suggests the possible involvement of the Nagaland Armed Police in the raids — a suspicion strengthened by the arrest of a NAP officer while moving around in the affected areas in a Nagaland government vehicle carrying ammunition. Both Vizol and Borbora have denied the involvement of the NAP in the raids, but it is quite possible that some NAP men while away from duty took part in the raids. The involvement of some former Sema 'hostiles' in the raids has of course been established and a former leader of the Federal Army has been arrested.

The total area under dispute covers 1,929 square miles in Sibsagar district and about 856 square miles in Nowgong district. Nagaland has been claiming the five reserve forests of Desoi valley, Nambor, Rengma, Diphu and Dhansiri. According to Nagaland, the boundary between the two states should be fixed according to the notification of 1867, while Assam maintains that the Notification of 1925 (on the basis of which the Bill for the creation of the State of Nagaland was moved in Parliament) should be the final basis of settlement. Both the chief ministers have in their latest statements reiterated these positions. After his January 2 talks with the Nagaland chief minister, Borbora had said that the 'Sundaram Report' (whose very existence is now being sought to be denied by the Union Home Minister who claims that the one-man committee appointed to go into the Assam-Nagaland boundary question did not actually submit a report but only some 'comments' — what H M Patel describes as 'Sundaram Papers') need not be binding on the two states and could only form the basis of a permanent settlement. At that time he had not made it clear that there could be no settlement outside the 1925 Notification. The Centre's indifferent attitude towards the problem is bound to lead to a further hardening of positions on both sides.

Skirmishes, raids and abductions have been quite common in the villages bordering Nagaland and the events of early January were part of a long-nourished rivalry between Naga and Assamese — primarily plains tribal — settlers over the possession of rich, cultivable land. Armed raids and forced harvesting of crops by Nagas has been a common occurrence. In 1956 the Uriamghat Reserve Office and the Uriamghat Bazar were looted by armed Nagas who adbucted a forest official and set several lorries on fire. In 1957 villages in the Chungajan-Naojan area were raided and the Naojan Railway Station was attacked. The following year a forest contractor was abducted. In 1964 five villagers were abducted from the Nambor reserve forest area and in 1964 an Assamese gaonbura's (village headman) son was killed. In 1965 armed Nagas looted the Doyang Reserve Office and abducted a senior forest official. In 1974 there was a raid in the Geleki Reserve of Golaghat in which a forest official, Abdul Alim, was killed. These are just a few instances, but they clearly show that raids by armed Nagas have been a common occurrence in the villages bordering Nagaland.

The January 5-6 raid was different only in the sense that it was meticu-

...y planned and frighteningly well ... To attribute the attack to international conspiracy or to Chinese designs is worse than being foolish; it is to ignore the real issue which is land. In the present case, a section of Naga village chiefs along with the newly emerging group of Naga landholders carried out the raid in the hope of dispossessing the non-Naga settlers and occupying their land. They were fully aware of the growing boundary tension between the two states and rightly believed that once the raids took place both the Assam and Nagaland governments would be forced to play down the incidents, each in its own interest. That there has been a deliberate attempt to tone down the intensity and scale of the raids is evident from the reporting of the raids. At first the event was almost dismissed as yet another attack by Naga 'hostiles'. Later, efforts were made to cover up the actual number of casualties. While it is true that the actual death toll may be difficult to ascertain, given the nature of the terrain and the fact that during the last Census the affected villages were not covered, yet to put the total number killed at about 50 is a gross underestimation. First hand reports speak of the entire population of at least two villages being wiped out and according to police sources in Assam, at least 800 bodies have so far been recovered. The Assam agriculture minister, Sonoswar Bora, is on record as saying that well over 1,000 persons must have lost their lives. It is widely believed in Assam that many of the dead bodies have been secretly disposed of. But both the state governments, for reasons of their own, are keen to keep the death toll low. Official acknowledgement of higher casualty figures would further embarrass Borbora government which is currently facing strong public indignation for what is being termed as its incompetence; Vizol on the other hand has been saying that taking advantage of the present situation the Assam Police has been uprooting Naga villagers and carrying out atrocities. With the Centre too shying away from a high-level probe into the January events, the total number of deaths will probably never be known.

The immediate reaction to the raids in the Assam valley has been in the form of protests and demonstrations against the state government's failure to take preventive steps despite the chief minister being forewarned of the situation prevailing in the border villages. In the mobilising of public opinion against the Borbora ministry the Purbanchaliya Lok Parishad and the Asom Jatiyatabadi Dal have been on the forefront. The call for a day of mourning given by the Lok Parishad received spontaneous response in the Brahmaputra Valley districts, while the Republic Day functions were boycotted by a large section of students and the public in response to a call given by the All Assam Students Union. There have been some stirrings in the cabinet too and one of Borbora's most trusted colleagues, the finance minister Kehsb Gogoi, wanted to resign but has been persuaded to stay on. For the time being there appears to be no direct threat to the leadership of Borbora. But it is certain that the boundary issue will be used by that section of Janata legislators who are working for a change of leadership.

A notable aspect of the public indignation over the Naga raids has been that political parties and organisations of various shades, while condemning the raid and the state government's incompetence, have continued to call for amity and understanding with the Naga neighbours. There seems to be a growing realisation that mutual quarrels between the north-eastern states is bound to be self-destructive. Even the All Assam Students Union has acted in a sober manner, organising relief and cautioning people against anti-Naga frenzy. Local cultural organisations like the Asom Sahitya Sabha, while expressing sentiments against further fragmentation of Assam, have stressed the need for a peaceful and amicable settlement. Both the regional parties, the Purbanchaliya Lok Parishad and the Asom Jatiyatabadi Dal have dutifully stressed the long-standing historical links between the Assamese and Naga peoples. All this has contributed towards curtailing the growth of anti-Naga frenzy amongst the people and till now there have been no cases of assault on Nagas living in Assam. It is true that Naga students in Assam colleges have not returned to their institutions fearing retaliatory attacks but in the present climate such retaliatory attacks seem unlikely.

It is against the Centre that public feelings seem to be primarily geared. Events as those of January 5-6, had they occurred elsewhere in the country, would have led to a sense of national crisis and would have caused the prime minister to rush to the affected area. But in Assam, the chief minister had to rush to Delhi.

Landlord as Labour Leader!

C V Subba Rao

ENTRUSTING all work, barring actual mining, to private parties in state-owned coal mines seems to be an established practice all over India (see, for instance, "Trade Union Mafia in Dhanbad" by Arun Sinha, *Indian Express*, January 23, 1979). But the case of Singareni collieries in the Telengana region of Andhra is distinguished by the presence of big landlords controlling labourers.

Though the workers involved in mining in pits and screening plants are employed by the state, a large number of workers required to lift the dumped coal are private labourers. While making a mockery of the idea of public sector, this private labour system is often the prime cause of fluctuating coal production, seriously affecting industrial production as a whole. With the extortions by the contractors and insecurity of employment threatening them every day, the pent-up discontent of the workers periodically breaks out in violent protests leading to fluctuations in production While coal companies, railways and electric supply undertakings blame each other for coal shortages and large pit-head stocks, the Government of India lets private contractors play havoc with coal production under its patronage

In the Mandamarri mines, belonging to Singareni collieries, private labourers are under the control of a landlord, Sripati Rao He is the only son of Mandamarri Madhava Rao whom the CPI(M) leader, P Sundarayya, in his book "Telengana People's Struggle and Its Lessons", listed as one of the notorious landlords (owning more than 10,000 acres) against whom the people had risen in the Telengana armed struggle of 1948-51 When the Singareni collieries wanted to take over large parts of his land for mining purposes in 1957, Madhava Rao had offered stiff resistance. Allegedly, he himself opening fire on the officers, killing one. He was reportedly acquitted by the court on grounds of insanity! However, his son has adapted himself far better to the changing conditions. Today he is the biggest individual beneficiary of the coal mines in the area. While effectively owning a little over one thousand acres he is also the biggest arrack contractor and trader in the area, Besides he is also a theatre owner and a movie producer. The panchayat samiti for the villages around is controlled by him. Practising the notorious *vetti* system, he even controls the land legally owned by the collieries.

In 1978, when the company introduced the system of directly delivering the coal from the pits to the buyers, private labourers were required to load the coal into lorries. The labourers generally come from the landless strata of the villages around. Driven by their deteriorating economic conditions they are attracted to coal mines by the prospect of a regular job. Most of them invariably end up as private labourers loading coal into lorries. In the Mandamarri mines, the number of private labourers engaged in this work ranges from 400 to 1,200 a day. The lorry-owners used to pay Rs 60 per lorry, but the labourers can get their daily wage only through middlemen who are merely goondas operating for the landlord. As much as 40 per cent of the wage paid by the lorry-owners is allegedly appropriated by these 'middlemen'. Moreover, the labourers can get a job in the mines only by the goodwill of the landlord which costs anything from Rs 1,000 to Rs 2,000 How the landlord manages to get these appointments made with the officials of a public sector undertaking is shrouded in mystery.

The workers who get their appointments through the landlord are expected to join the INTUC-led National Employees Union This Union along with the Singareni Coal Loaders' Union also led by INTUC, played a key role in getting the wage of the private labourers increased to Rs 100 per lorry With the number of lorries increasing upto 100-150 a day, the landlord is now able to earn more than Rs 4,000 per day through the illegal extortions The president of these INTUC unions is none other than Sripati Rao himself.

There is another union, Singareni Collieries Workers' Union, affiliated to AITUC It is led by a popular CPI leader of the area, V T Abraham. On [illegible] agitated by yet another increase in extortion by the landlord, Abraham mobilised the workers and forced the lorry-owners to pay directly to the labourers. Three days later, on January 5, he was attacked by 40 goondas near KK5 pit. Eventually his unconscious body, along with those of three other activists, was removed to the hospital at Nancharyal by the workers.

Next day morning, incensed by the murderous attack on their leader, over 2,000 workers boycotted work and gathered at the market place. Driven by anger, they damaged the property of the landlord. Later, as the workers were dispersing, the special armed police reached the place and opened fire indiscriminately. Four miners were killed on the spot while two more died in hospital later on. Over 20 persons were injured. As the news spread to other areas, miners from Bellampalli, Ramakrishnapuram and Kagagnagar also walked out of the mines. There was a spontaneous massive demonstration and total bandh in Bellampalli on January 7. The entire coal belt is still reverberating under the iron heels of Andhra's special armed police enforcing the prohibitory orders.

Taking advantage of the presence of a few members of the Radical Students Union, the state's Inspector General of Police issued a statement linking the workers' agitation to "the increasing activities of the extremists". It should be noted that Mandamarri is part of Laxsettipet taluk of Adilabad where, along with neighbouring Karimnagar district, a strong peasant movement is questioning age-old feudal oppression. The IGP's statement is thus ominous for the region. It has always been the practice of the Andhra government to carefully build up its justification in advance for the invocation of the Andhra Pradesh Suppression of Disturbances Act by alleging 'extremist' activity.

The injured AITUC leader is now lying in hospital with serious injuries. No one has been arrested so far for the attack on his life. On the other hand, more than 25 miners have been detained in the Nizamabad jail, well over 180 kilometres away.

Towards a Women's Movement

TWO-DAY women's conference was ;anised by the Stree Mukti Sangathan February 10 and 11 in Pune. In a ,cent women's movement, as wide a ɔport as possible may be needed at initial stages. "Women's Issues" can n generate identification and appeal. is was perhaps what was at the back the organisers' invitation to all ɔups and political parties.

Some 300 women responded to the ʼitation. The participants came from iny districts of Maharashtra: ıule, Kolhapur, Sholapur, Ahmednagar, ıhanu, Nanded, Thane and, of course, ımbay and Pune. There were a ındred or so dalit and adivasi women, ıny of whom had had to bring their bies with them. A couple of them re even accompanied by their ısbands. Middle class, white collar ıd professional women mingled with e dalit women.

In this informal and friendly setting ı adivasi woman from Shahada inıgurated the conference by garlanding e portraits of Pandita Ramabai and otiba Phule. She gave the clenched st slogan 'Stree Mukti Zindabad'.

The sessions were preceded by songs nd skits about women's liberation and mancipation. A small exhibition cf ictures and charts depicting the hisıry of women's enslavement had been ıt up on the walls of the school buildng in which the conference was held. Also displayed were Marathi translations of some well known Marxist classics as well as feminist publications such as *Manushi, Bayja, Mahila Andolan Patrika, Feminist Network* and the Newsletter of the Research Unit on Women's Studies of the SNDT University. The entire proceedings were in Marathi.

In a brief inaugural addresss, the President of the conference traced the history of change in women's status since Independence. The major beneficiaries of legislative reform and development had been educated, middle class women. To the large masses of women, the gap between the rights formally granted in the Constitution and the reality of their daily existence was too great to lend any credibility to these reformist measures. Middle class women had, therefore, to come out of their self-centred lives and help their less privileged sisters. The purpose of the conference was declared to be crystallisation of ideas on how women could organise themselves and launch struggles against oppression; rights, even when they existed, needed assertion for their actualisation.

The participants were divided into ten groups for the discussions: students, teachers, mahila mandals, doctors/paramedical personnel, gramsevikas, trade unionists, political representatives, agricultural labourers / dalits / adivasis. The largest group was that of the dalits and adivasis. Some twenty dalit women spoke of their problems and their experiences in organising and participating in struggles to secure enforcement of the minimum wages act and to protest against atrocities. The importance of women organising themselves, of standing together was repeatedly emphasised by all the speakers. The common problems that rural women faced came up again and again: lack of drinking water, unemployment, need for supportive services like balwadis, enforcement of equal wages act and some machinery to deal with sexual and other atrocities against women. There had to be greater effort to spread adult education among dalit women, to secure better public health and hygiene measures, effective implementation of the employment guarantee scheme (EGS), etc. Many women could not report for work under the EGS as the work sites were far away; the condition about a minimum number reporting for work was unrealistic; payment was often delayed, and so on. The women had no arrangements to look after their babies at the work sites, not even sheds to protect them from the sun. Drinking was a serious problem. Why was the government, many dalit women asked, supposedly interested in their welfare, collaborating with private sector to put up toddy shops?

The trade union group reiterated the need for action to eliminate discriminatory practices by employers. Unions must mobilise more women members. There was discussion on how employers practised discrimination and evaded labour laws relating to women. Women needed to be pulled out of low-paid, low-skill jobs and for that more technical education was needed. Doctors and paramedical personnel recommended that three-four local women be trained by every woman registered medical practitioner to deal with the health care needs of poor women at the local level. Writers and representatives of the mass media pleaded for more coverage of news about women and the need for prompt and detailed reporting of atrocities against women to arouse the public conscience. Also, there was need for close links between journalists and action groups of women's organisations. There had to be more organised protests against the image of women propagated through Hindi films, along the lines of the protest against "Satyam Shivam Sundaram" in Pune.

Mahila Mandals could achieve much more by changing their mode of work and moving out of their welfare and charity oriented framework and operating as agencies to mobilise women. Students could generate greater social awareness among youth, and popularise women's studies courses. There was need for greater representation of girls in technical courses. Women leaders and members of political representatives had so far been exclusively concerned with advancing the general political line of their parties. They needed to shoulder greater responsibility for securing implementation of existing laws pertaining to women.

When the groups emerged from their discussions, a number of major demands were formulated and put forward:

(1) the establishment of an Independent Tribunal consisting of women voluntary workers and with judicial powers, to be operative at the taluka level, to which cases of dis-

crimination, atrocity, etc, could be referred;

(2) enforcement of equal wages act and 25 per cent representation for women in jobs and in technical institutes;

(3) recognition of the social nature of women's work in the family by way of house-work and child-care; only by providing socially arranged services for these activities can women be enabled to play an equal part in the development of our society; a women's cell should operate in every productive organisation to ensure the provision and proper running of such supportive services;

(4) provision of drinking water, as a matter of the highest priority, for the rural and urban poor;

(5) review of the EGS in order to enable women to take better advantage of it; more complete and comprehensive registration of unemployed women;

(6) provision of separate sanitary facilities for women in the rural areas and in areas where the urban poor live.

(7) enforcement of prohibition to save working class women and families from ruin (all the dalit and adivasi women strongly supported this demand).

The list of demands into which the conference tapered off was something of a disappointment after the inspiring beginning. The conference ended without discussion of what the difficulties are in getting the demands met or how various groups can spearhead programmes of action. In a system characterised by massive and growing unemployment, of men as well as women, will reservation have any meaning? Also who are the women who would get the reserved places? The question of minimum wages in agriculture cannot be dissociated from the land distribution problem and the economics of peasant-cultivation, any more than can the question of women's employment be viewed in isolation from the structure of property relations in society. This raises the question of the links of the women's movement to, and its place in, the larger political movement. Even in seeking partial solutions to specific problems questions of how and what action and by whom have to be raised. By skirting many such issues the conference lost some of its significance.

Nevertheless, there can be little doubt that without such initial exercises a women's movement cannot emerge.

LABOUR

Many Loose Ends

Timir Basu

THE proposed indefinite strike in the engineering industry from January 12 was called off following a tripartite settlement, long overdue, arrived at between employers and employees on January 11 on some 16 agreed terms. The last tripartite agreement in the engineering industry had been signed on June 25, 1973. The latest agreement will be binding with effect from January 1 and shall remain in force till December 31, 1981, if otherwise not terminated by either side by serving two months' notice.

The latest agreement is just a carbon copy of the 1973 agreement with some slight difference in the increase in basic pay and DA. The CITU was in such a hurry to avoid the embarrassment of a strike that its leaders forgot to discuss many issues which they had themselves raised in dozens of leaflets, circulars, etc. The objective was to [illegible]w secure an agreement.

After the expiry of the last agreement, employers had deprived workmen of some Rs 1.5 crores by delaying the 1973 settlement by four months. CITU had on that occasion accused the erstwhile Congress government of taking the side of the employers. This time, because of the much longer delay in the conclusion of the agreement, the workers' loss in wages amounts to Rs 10 crores if not more, but CITU is loth to blame its own government for this.

Further, factories employing less than 50 workmen have been kept out of the purview of the agreement. It is workers in these smaller units who are least organised and they continue to be deprived of the benefits of the tripartite settlement. At the time of signing the 1973 agreement it was stated that the case of workers of 'group A' units, i e, the small factories spread all over the Calcutta metropolitan district employing less than 50 workmen, would be separately decided. Nobody, however, cared to raise their case subsequently and the situation is no better today even with a CPI(M)-led government in power. According to the recent agreement, "terms and conditions of employment of workmen in the engineering units employing less than 50 workmen will be separately considered and determined by the government of West Bengal taking into consideration the demands of the federations and the unions". This is exactly identical to the clause, with the same wording, that had been included in the 1973 agreement. Neither the government nor the unions discussed the issue even once during the long period of negotiations leading up to the latest agreement. There is every reason, therefore, to think that, as at the time of the last agreement, the subject will now be quietly forgotten.

The number of parties to the latest agreement is the same as that to the last one, though BMS's Paschim Banga Engineering Mazdoor Sangh is one of the signatories for the first time. Its presence has been neutralised by the absence of the Engineering Association of India. The employers' side was represented this time by the Association of Indian Engineering Industries and any factory that does not owe allegiance to AIEA has thus every right to violate the principles laid down in the agreement.

Again, there is a wide gap between the workers' demands and their achievement. The nine federations of engineering workers submitted charters of demands on different dates in 1977 on the expiry of the June 1973 settlement. The demands included, among other things, a need-based minimum wage of Rs 632 per month, as per the fifteenth Tripartite Labour Conference, reopening of all closed and locked out factories, establishments and offices, stoppage of lay-off and retrenchment, full neutralisation of cost of living through DA, higher rate of yearly increments, increased house rent allowance for all workmen, proper categorisation, *reinstatement of all workers* who were victimised for their trade union activities and of those who had been prevented from joining their duties by hoodlums of employers and subsequently dismissed, filling up of vacancies, and last but not the least, abolition of use of the contract system of labour for doing work of a perennial nature.

The employers kept quiet over the

demands for a long time. The office of the Labour Commissioner did not get the comments of the Association of Engineering Industries before the end of October 1977. The management distorted the meaning of need-based minimum wage and refused to meet any of the demands of the workers. Attempts to open a dialogue with employers failed. So workmen throughout West Bengal jointly resorted to a one day token strike on December 15, 1977. Thereafter, the unions, led by CITU, delayed resort to the strike weapon, under one plea or another. Though in speeches and press statements, it was emphasised again and again that settlement of the workers' long-standing demands could brook no delay, the decision to launch an indefinite strike was taken only in October 1978 at a convention attended by CITU and its three allies

According to the new settlement, engineering units will be grouped into three categories — group A consisting of factories employing less than 50 workmen, group 'B' of units with between 50 and 249 workers and group C of units employing 250 or more workers The group 'D' category, units with more than 1,000 workmen, which had been introduced in the previous agreement, has been dispensed with this time So far as grouping is concerned, the exclusion of group 'A' from the ambit of the settlement is the most objectionable part of the agreement.

The basic wages of workmen in group 'B' will be increased by Rs 52 per month and that of those in group 'C' by Rs 56. The rates of increments of all categories of workmen at all stages will be enhanced by Rs 2 over the existing rates The last agreement had resulted in a pay rise of Rs 50 and Rs 54 on average and so the present settlement represents no marked improvement over it. Most important, the workers are still far from achieving their demand for a need-based minimum wage

Under the settlement, DA will continue to be linked with the consumer price index for the working class for Calcutta with 1960=100 as base. This 1960 base needs a thorough revision, if not total rejection. That the compilation of the 1960 series suffers from a number of defects, resulting in enormous loss of wages to workers, was never even raised by any of the unions at any stage. The rate of neutralisation is to be Rs 1.30 per point of rise or fall in the index, instead of Rs 1.15 as under the previous agreement But even this rise of Re 0.15 is not uniform, DA has been pegged at 300 points, which will be regarded as the floor level. For rise or fall between 300 and 314 points, the adjustment will continue as before, i e, at the rate of Rs 1.15 per point instead of a Rs 1.30.

The workers' demand for categorisation has been referred to the government for action, which simply means that there will be no action before the next settlement. Another controversial issue which has, as usual, been left undecided is that of piece rates and that of bringing piece-rating on par with time-rating. It has been agreed that "the existing piece rates (based on job rates) shall be suitably adjusted taking into account the average wage increase of the time rated workmen of the corresponding category. Pending suitable adjustment of the existing piece rates, these categories of workmen shall be given with effect from the date of effect of this agreement an *ad hoc* increase commensurate with the wages of the time-rated workmen of similar category". This will create many complications which might jeopardise the very purpose of the agreement.

Strangely enough, not a single union insisted on the abolition of contract labour in jobs of a perennial nature and there is no reference to this subject in the agreement. The fact is that even the most sophisticated units are resorting more and more to contract labour practices. Fresh recruitment of permanent workers has been virtually topped. Posts lie vacant year after year. Some one lakh workers have been thrown out of employment during the last few years and no retrenched worker will have his job back as for the next three years there will have to be complete industrial peace at any cost — that is the condition binding upon the parties to the latest agreement. Nor will the workmen get a single paisa for the period of the deliberate delay by the management in the conclusion of the agreement.

The implementation of the agreement can by no means be taken for granted. It is quite likely that a large number of employers will violate the principles of the agreement if past experience is any guide. Disputes regarding violation of the June 1973 agreement are still pending before the legal authorities without any action. For instance, 12 workers of Austin Distributors were sacked when they asked the management to implement the 1973 award. Such victimisation has been rampant. The cases of such workers should have been settled before the final seal was put on the latest settlement. This time once again there is no guarantee that workers in different establishments will not be victimised. Certainly, these factories which did not implement the 1973 award cannot be expected to take the new award any more seriously.

The government of West Bengal had issued an order on February 22, 1974 asking small engineering firms to pay a minimum wage of Rs 200 per month. However, the Calcutta High Court, on a petition under article 226 by some employers, passed a stay order in respect of their factories. The issue has been hanging fire since then and workers have not been getting the minimum wage. The CPI(M)-led Left Front government too has failed to single out the problems of workers of such small firms.

There will also be serious disputes over the fixation of the productivity norm, as this has been left to be done at the plant level. In the absence of any concrete guidelines, management will try to increase the workload as part of the implementation of the new agreement

REVIEW OF MANAGEMENT

March 1979

Review of Management is published four times a year, on the last Saturday of February, May, August and November.

Manuscripts intended for publication should reach the Editor at least six weeks ahead of the date of publication.

OFFICIALESE is the idiom in which the ruling class addresses what it calls "society". The importance of officialese in obfuscating blatant class interests and fostering a false consciousness is a matter that merits more than passing attention.

A good example of officialese at its obnoxious best is the Economic Survey for 1978-79 presented to the Lok Sabha by the Finance Minister. If sense has to be made of it, it has to be read, re-read, and cross-checked. On a single reading — which is what most people will give it — it tends to lead one away from fundamental issues in a reasonable sort of way. That is what it is meant to do, and that is why it is an important weapon in the armoury of the ruling class.

Two examples should suffice to make this point. The Economic Survey ends (page 58, para 8.27) thus: "Finally, a reference must be made to a problem which vitiates India's entire development effort, *viz*, the growing population. The problems of poverty and unemployment which the country currently faces are as much due to growing numbers as to the failure to raise national income rapidly .... It [the employment problem] would become almost insuperable if numbers are allowed to grow at current rates. .".

This, at the end of eight chapters and 57 pages in which the Indian economy's performance in 1978-79 is discussed. On a number of counts, it is flogging a dead horse. It assumes without proof that India's entire development effort is vitiated by the growing population. If we look at the per capita availability of food, we see that it is (marginally) higher today than in the late forties. So is the per capita availability of power, or of steel. But like the average depth of a river, this figure, even if taken together with the twenty million tons of food that are stockpiled, is deceptive, for it tells us nothing about why such large disparities exist. It is to this — actual policy of distribution in all its dimensions — that attention must be directed, not to the absolute number of people. And the point about the entire development effort must be exposed too. The Economic Survey itself talks of unutilised capacity and locked up resources, which on the whole has not shown any improvements over the last year (page 14). A development effort which keeps unemployed labour side by side with unemployed capital (in a situation that is not a Keynesian depression) is hardly one that deserves to be taken seriously. Thus one must ask why the false bogey of numbers of people is put together with a ludicrous development effort to conclude that population growth is the cause why "as a nation, we may be running as fast as we can, in Alice in Wonderland fashion, to remain in the same place".

Without in anyway denying that high rates of population growth will cause major problems in the future, it can be argued that the mythical population problem diverts people's attention from the basic cause: class domination.

The other case is the discussion on industrial unrest (page 56, para 8.16). The Economic Survey notes that the current state of industrial unrest indicates that it is more than a "natural reaction" to the "stringent restrictions imposed on legitimate trade union activity during the emergency". It goes on to say that "it seems that legitimate wage bargaining disputes are not always at the root of the unrest". Legitimate according to whom? And is wage bargaining the only sort of trade union activity that is legitimate, as this sentence implies? The Survey adds that "organised labour seems increasingly willing to use its strength to secure short term benefits for itself unmindful of the consequences of its actions on the society at large and on itself in the long run". The Economic Survey's argument about industrial unrest only needs to be related to the thesis of the Karnataka Chief Minister, Devraj Urs, that organised labour is responsible for poverty because it exploits unorganised labour. Apparently, the capitalist stands aloof from this whole process. The relevant section of the Economic Survey ends by advocating class harmony. "It is necessary to evolve a certain understanding in this regard with organised labour and other productive sections and society . it is most important that there is co-operation among the different sectors of society to increase the size of the national cake rather than competition in sharing it...".

The class role of officialese becomes clear.

A Case of An [illegible]

S K Bhattacharyya

Accumulated Deficits of Public Enterprises by J Satyanarayana, Institute of Public Enterprises, Hyderabad; pp 317, Rs 40.

IT is difficult to maintain the required academic-philosophical objectivity in looking at detailed statistical analysis of accumulated deficits of pubilc undertakings when a body so august as the World Bank said in its 1976 report on the Indian economic environment that the surpluses of Indian public enterprises were one of the most significant factors in the reversal of the inflationary trend. There has been much indulging in bravado at the turnaround in public enterprises' performance — figures have been quoted as to how companies which had wholly lost their equity base are now earning crores of rupees of profit. This is all to the good though some skeptics say that at least part of such profits can be attributed to the niceties of accounting, i e, innovative valuation of work-in-progress, turning the "stone eye" on uncollectible revenues, capitalising expenses which seem to lesser mortals to be revenue expenses! The new generation of accounting experts — at least some of them — in public enterprises seem to be able to take on their brothers-in-faith in private sector and beat them at their own game.

There is no doubt though that a new wind is blowing in the corporate world of the public sector and that several able and outstanding chief executives in key public sector undertakings have brought in a new dimension of management which is making these enterprises key instruments for the translation of our aspirations for economic development and growth. There is also little doubt that nowithstanding the change in the government, public sector undertakings will continue to play this new role of provider of resources for growth and development plans, generator of services and goods badly needed by the economy, innovators of R and D, exporters of goods and equipment which were always considered beyond the Indian threshold level. Many public undertakings are still lagging behind, but in statistical terms they are not all that significant, particularly after the turnaround of the high technology based enterprises.

In this [illegible]t, one is somewhat hard put to [illegible]n the required detachment [illegible]ectivity which seems to pervade Satyanarayana's work. Perhaps what renders it somewhat less than valuable at this point of time is that it relates to the period upto 1968 — almost a decade ago. Even then it would have been a useful contribution if one could glean from this exercise a historical understanding of why in the earlier stages, public sector undertakings incurred such heavy losses. The statistics are formidable. Even though the study relates to only 26 "losing concerns" (as the author terms them), the 300-odd pages including 97 tables — accounting for almost 50 per cent of the total volume — analysing in assorted permutations and combinations the different balance sheet figures of these 26 undertakings. It was Livingstone of Harvard Business School who said that statistical analysis carried out in a completely dispassionate manner unrelated to managerial purpose generates analysis paralysis. The book would have provided considerable grist to Livingstone's mills. Esoteric permutations and combinations are attempted. Some of them are not employed by financial analysts in real life situations, e g, analysis of sales to capital employed, loss on township as percentage of equity ("loss" being defined as the expense on township!), etc. Even the more conventional ones attempted by the author raise the basic question which has nagged financial analysts for many years, *viz*, how do you compare the figures in the balance-sheets of two companies when accounting methods relating to valuation of inventory, provision of depreciation, amortisation of expenses, etc, could be completely different? How relevant would be the comparison of undertakings with relatively modern equipment and technology with those which are not so blessed? How do you build into the analysis the problems of location, managerial styles and beliefs, problems of management structure and control, etc. Indeed there are some who contend that financial ratio analysis is useful only as trend analysis of the same enterprise over a period of time rather than as comparisons of ratios of one organisation with another.

Satyanarayana does provide overwhelming statistical evidence that in the sixties the profitability ratios of these 26 undertakings were low, inventory was high, social expenditure was considerable, etc, but can one look at all these without examining at some depth the context in which these undertakings operated. Is it not necessary to relate such analysis to the role assigned to them either in relation to generation of goods and services required for the economy or maintaining the price level or ensuring the critical mass of supplies. Since many of these undertakings were monopoly organisations, the easy solution would have been to just increase the prices of products, equipments and services to turn such "losses" into profits Would the deficit then become converted into desirable surpluses? If so what violence would it do to the very basic concept of the public sector? It would have been therefore reasonable if the analysis had been extended to the examination of the difficult, but nonetheless necessary, matching of social and financial objectives as also the managerial perspective of the operations of public undertakings during that period. In spite of very considerable statistical analysis work done, there is no evidence that this was attempted. Such an analysis would have required more than computation of financial ratios — analysis of the "policy" papers leading to the establishment of the unit, the annual reports of the administrative ministries, parliamentary debates and most importantly, interviews with the ministers, secretariat officials concerned with the operation of these undertakings, Planning Commission, Bureau of Public Enterprises and, most importantly, the managers at all levels of these public undertakings. Unless the problems identified by the financial analysis were matched by such indepth probes, they can only result in a morass of figures. The fact that during the last decade the situation has completely changed merely serves to strengthen the feeling of irrelevance of such studies. Obviously, the chemistry of management of public undertakings has changed during the last decade. Satyanarayana's work provides us with no clues about the backdrop for that forthcoming chemical reaction.

[illegible]

G R Kulkarni

This paper examines one typical case of a public sector company so as to study how problems arise in actual practice and what needs to be done to enable the management of that particular enterprise to further improve its working.

In the first part of the paper the author studies the functioning of the State Trading Corporation of India. The second part of the paper draws on this experience to formulate some tentative conclusions and recommendations with respect to the management of public sector enterprises as a whole. These may help in improving our understanding of the behaviour and performance of public sector managers and in examining the need for a clearer ideology for public sector management.

THE purpose of this paper is to identify and analyse some concrete problems which arise in the management of corporate public sector enterprises in India, and to make recommendations for treating them.

A number of public sector corporations have been set up under the Indian Companies Act during the past few years. These corporations are expected to function as autonomous undertakings on sound commercial principles. They are expected to operate efficiently and economically so as to minimise their costs of production, and also to serve social objectives. In certain cases social objectives are given more importance whereas in others social objectives may play a secondary role. Whereas profit is considered a good indicator of performance, it is not the only indicator. In cases where social objectives are given greater prominence, a shortfall in profitability may not be regarded adversely if the enterprise can show that it has made every effort to keep all its costs down to the minimum.

Public sector companies face the same problems in management as companies in the private sector, though it may appear that on account of government ownership and the privileges arising therefrom they are sometimes at an advantage over private companies with regard to the discharge of some of their functions. For example, they can raise funds more easily, they give the impression of being subject to lesser regulation and, on paper at least, they have greater freedom to expand, diversify, modernise, and innovate. Such advantage does not extend to areas like labour relations, availability of technology and technical manpower and the operation of market forces. However, when one talks of management problems in the public sector, one generally refers to problems which arise on account of the enterprises being government-owned, and being publicly accountable. Literature on the subject categorises such problems as those which arise from :

(a) multiple public accountability,
(b) interference from government,
(c) bureaucratic style of functioning, and
(d) lack of continuity and absence of stakes arising from lack of ownership status for management.

Many recommendations have been made to treat these problems in a generic way. In this paper we propose to take up one typical case of a public sector company so as to study how problems arise in actual practice and what needs to be done to enable the management of that particular enterprise to further improve its working. In the first part of the paper we shall study the functioning of the State Trading Corporation of India. The study is based on information collected from published sources such as annual reports, chairmen's speeches, publications of the Bureau of Public Enterprises and comments in various studies and reports, including reports of the Committee on Public Undertakings.

In the second part of the paper we shall draw on this experience to formulate some tentative conclusions and recommendations with respect to the management of public sector enterprises as a whole. These may help us in improving our understanding of the behaviour and performance of public sector managers and in examining the need for a clearer ideology for public sector management in this country.

I

The STC Situation

The State Trading Corporation was set up as a public sector company in 1956. It had two principal objectives :

(i) to broaden and enlarge the scope of India's exports, and thereby serve as a catalytic agency for developing non-traditional items for non-traditional markets; and
(ii) to arrange for essential imports.

Over the years, STC has come to be recognised as a successful public sector undertaking. As will be seen from Table 1, its turnover has increased rapidly.[1] Between 1972-73 and 1976-77 its exports increased from Rs 158 crores to Rs 661 crores and its imports increased from Rs 126 crores to Rs 299 crores. It has been a highly profitable undertaking. In 1975-76 the profit had risen to Rs 26.06 crores (Table 2). A substantial part of the profit is being made over to the exchequer in the form of taxes and dividends. STC has, therefore, acquired an image of a successful public sector company, in spite of its having to operate in the sensitive area of foreign trade, against world competition, on sound commercial principles.

Soon after the close of the accounting year 1976-77, two major developments took place. The international price of sugar (an important item in STC's export basket) dropped from a peak of £ 600 per tonne to £ 90. Sugar had contributed to Rs 464 crores to STC's export turnover in 1975-76, and Rs 152 crores in 1976-77 (Table 3). Now sugar had ceased to be an exportable commodity because, at £ 90 per tonne, it was no longer worth exporting any sugar from India.

The second development related to changes in government's foreign trade policy. Between 1964 and 1974, government had canalised a number of items for export and import exclusively through the STC (Table 4). In 1976-77, 76 per cent of STC's exports and 97 per cent of STC's imports consisted of canalised items (Table 1). The trend towards decanalisation, started in 1974, was accelerated after the recommendations of the Alexander Committee on Foreign Trade Policy in early 1978. Several items were likely to be decanalised and imports were likely to be liberalised.

These two developments posed a threat of an immediate and substantial drop in STC's turnover and profits. Since there was very little scope for an

[1] Excluding profits/losses on imported cars and other domestic turnover

immediate expansion of trade in the other remaining products, STC's management was faced with two major problems :

(i) There could be a substantial reduction in the volume of work. What should be done to find work for the staff which STC had recruited over the years as its business expanded, and what should be done to cover fixed costs;

(ii) What new business should the STC undertake immediately and over the next few years; and for this purpose :

(a) how should new products be identified,

(b) how should new markets be identified,

(c) how should sources of supply be developed,

(d) how should markets be developed,

(e) how should personnel be developed to undertake new tasks, especially in the areas of procurement, merchandising and marketing, and

(f) how should the new operations be funded.

Alternative Approaches

In dealing with the two management problems described above, STC could possibly consider the following alternatives :

(i) Keep its fingers crossed and hope that, in spite of government's declared policy to reduce canalisation, market forces may still compel government to resort to canalisation and/or trading on government account in certain specific commodities and to use STC as a canalising agency This approach involves great uncertainty, in any case, trading opportunities may not come forth in sufficient volume to make up for the volume likely to be lost

(ii) Select a few products on its own and take steps for a rapid increase in their exports/imports so as to eliminate dependence on government to assign business from time to time. If this alternative is to be pursued, several difficult questions have to be answered, e g, what should be the criteria by which these products are to be selected? Where is information available about export potential or import needs? Should STC start a manufacturing activity, to provide an assured supply base for exports? What should this be and how big should be the activity? What could be done to attract Indian producers/manufacturers to come to STC for exporting their products? Do they have surpluses to export? What should STC do to motivate them to increase the surpluses available for export? What if they desert STC after STC has established a market for their products overseas? Would these operations result in profit or loss? Would not the image of STC suffer if it incurs a loss for the first time in several years? How would government view this approach?

(iii) The Commerce Minister, Mohan Dharia, has suggested some broad guidelines for STC's future working.[2] These include STC becoming an instrument of socio-economic development and for assisting the government in controlling the commanding heights of the economy. STC is also expected to assist in securing job-oriented economic development in the small scale sector. Should STC give these considerations primary importance in selecting its new product markets even though it might mean lesser profitability and even losses in the bargain? But what about its image? And what about the adverse notice it will attract in Parliament? So, should STC take up such activity on a smaller scale, and concentrate on other profit producing opportunities?

Implications of Change

Unless some unexpected development takes place, whereby alternative (i) above becomes feasible, a major strategic shift is inescapable, and such a shift can neither be planned nor implemented easily The STC management is likely to find that the initiative it can take is considerably limited because of its special status as a public sector company. The following observations help clarify this further :

(i) Though the objectives with which government established STC are known and clear, STC management has rarely taken any major entrepreneurial decision on its own Almost all business has been assigned to it by government notifications. The organisation has almost got into the habit of looking to government for providing leadership in making entrepreneurial choices.

(ii) Over the years the "concept of business" has turned out to be to trade in products/commodities assigned by government from time to time. There seem

to be no guidelines or criteria for choice by STC management of new products/markets. The product mix of the company is highly unstable. There is no distinctive competence in any particular product or market or in any task or activity. It will be immensely difficult for management now to choose a few new areas for concentrated effort on their own.

(iii) Trading in exclusively assigned items constitutes monopoly. Exporters themselves have to approach STC and so also importers. Therefore, little is developed by way of expertise to locate and develop sources of supply for exportable products. There seem to be no major long term relationships between STC and Indian producers nor major long term stakes through developmental efforts in foreign markets.

(iv) Little is also developed by way of expertise in procuring imports from sources of supply abroad. In the past the approach has been *ad hoc* and if, in the process, imports were procured at higher than the justifiable prices, the burden could always be passed on to the actual user of the imported item by charging him higher prices. Procurement was in turn dependant on the line of credit available and there was little choice but to import from that source at the stated prices.

(v) Much of the expertise is in operating as an agent, in processing indents and tenders and in transportation and distribution, not in merchandising, procurement, or marketing. It will take considerable time and effort to develop such expertise within the Corporation.

(vi) A strategic shift may involve trading on the company's own account and at its own risk. Since risks have not been taken in the past, it will take quite some time and effort to inculcate a change in attitude among personnel at this stage, after some 20 years of working under a different system. Secondly, the nature of accountability to Parliament, Audit, etc, as perceived by people, whether real or not, may act, as a further deterrent to a move in this direction.

(vii) In the past profits have come mainly from canalised imports. If the emphasis now shifts to exports, which in a competitive situation may not be profitable, a conscious decision will have to be taken to remain satisfied with a reduced or negative profitability for several years to come. This may not be an immediate cause for concern in view of the comfortable financial position of the company. It has Rs 36 crores of accumulated reserves against a requirement of only Rs 1.8 crores to meet a 15 per cent dividend payment on the paid up capital. But a conscious and a clear-cut decision on these lines will be needed on the part of the company as well as the government.

(viii) As a public sector corporation, what will be the limits to the authority and power of corporate management? What will be its role in bringing about change and what will be the role of the "government"?

The Management So Far

If one looks at the objectives with which STC was started in 1956, and the objectives which it may now try to pursue, there is little noticeable difference. Development of new export items to new markets continues to be the principal objective. So does management of essential imports. The first one implies overseas market surveys, identification of product markets with potentials, working with other development agencies within the country to secure production of desired items by different producers/manufacturers, assured offtake by STC of such production at remunerative prices, development of proprietory brands where necessary and effective marketing overseas with an assurance of sustained supplies for a long period. Managing imports of essential items implies formulation of a system to identify items where imports are currently essential or may become essential some time later, monitoring the supply and demand situation as also the price levels within the country, working with different government and non-government agencies to forecast

import requirements, making adequate arrangements for imports at competitive prices, as also for distribution within the country. However, over the years STC has not concentrated on such tasks. It has functioned mainly as an agency house for government, which was perhaps never the stated objective. The explanation for this situation probably lies in the system under which STC operates, the public sector *management* system.

INSTRUMENT OF POLICY

After incorporating the STC as an autonomous public sector company, government set about shaping it into an instrument of government policy. For that is what public sector corporations are intended to be; and, in turn, government is also held accountable for their performance to Parliament.

Initially, civil servants manned all senior positions in the Corporation including that of Chairman and Managing Director. *Being civil servants themselves*, they would probably have been in the best position to understand government policy and help constructively in shaping the STC into an instrument of such policy.

The Board was constituted from among representatives of different ministries so that "interests", "viewpoints" and "policy" of different ministries got due representations.

Very few important decisions were to be taken without reference to government. High value sales and purchase contracts were to be approved by government in advance. Sales prices for imported commodities were to be fixed by the government. Opening of offices, appointment of senior personnel and proposals for capital expenditure could be finalised only with government's prior approval.

Government issued notifications canalising one item after another through the STC. STC was rarely consulted.

(a) whether STC considered such canalisation necessary,

(b) whether it had done adequate preparatory work to administer it, and

(c) the extent to which STC could do justice to the objectives of canalisation within its existing resources, the additional resources needed and the ultimate cost benefit of the proposed policy. In fact even after canalisation government may not have necessarily communicated to STC the exact objective of canalisation and the qualitative results expected of STC with reference to which its performance in this regard could be apprised.

The STC management came to regard canalisation as a great blessing, because it conferred on it monopoly rights. It provided an opportunity to make a profit without the probability of any serious questioning or evaluation of the attention paid to socio-economic considerations. In later years, we also witnessed the spectacle of some canalising agencies fighting with others to ensure that particular items on the canalisation lists were assigned to them and not to the others.

At this stage the original objectives of promoting exports, STC being a major catalytic agency for broadening and diversifying India's export base, etc, were probably lost sight of both by the government and STC. The policy for which STC was the instrument no longer related to these objectives. Instead STC became an instrument to implement the policy of canalisation. The Ministry of Commerce evaluated its own performance by reference to the total export turnover from India. As it rose, the Ministry felt contented. No questions were asked as to the earnings of convertible currency, the degree of subsidisation of exports or the adverse changes in the terms of trade. The only indicator of performance of the ministry was India's export turnover. STC also came to evaluate itself in terms of growth in its own turnover. No questions were asked about profitability of exports, balance between canalised and non-canalised items, development of marketing expertise or the concern for socio-economic objectives. No questions were also asked while evaluating performance about the degree of satisfaction of customers of STC, its quality of service or the efficiency of its operations. Profits reached record levels. Dividends were declared. Huge reserves were built and large cash balances were accumulated much in excess of the company's requirements. The company got credit for profits which it could earn only because it had a monopoly and it could charge very high prices from importers of canalised items. Sometimes questions were, in fact, raised whether these profits rightfully belonged to the Corporation or to the government. Those who believed that such a distinction did not matter because both agencies were ultimately "government", had come to treat STC not as a distinct autonomous entity, but as a part of government itself. In fact many in the STC also came to share this belief.

DEFINING STC's NEW ROLE

From the speeches of the Commerce Minister[3] and the STC Chairman,[4] it seems clear that both the government and the company are keen on changing STC from an agency of government to an effective, autonomous company which acts as a spearhead of India's export effort as also a stabilising influence on domestic prices through timely imports. In choosing its product-markets in furtherance of this primary objective STC will have to give substantial consideration to the prospects of creating new job opportunities in the small-scale

*Denotes value below Rs 50 lakhs.

sector and will also have to bear in mind the need to acquire market influence in those sectors which enable government to exercise greater control over the commanding heights of the economy.

What are the implications of STC planning for such a role:

(i) As captive business declines, STC management will be called upon to do some strategic thinking to create new business, much of which may be in the area of developmental exports. In the past STC management had devoted little time to such thinking.

(ii) Much of the new business will be on STC's own account and at its own risk. STC will, therefore, have to assume the role of a genuine trader operating in a competitive environment. This implies greater initiative and care in the choice of business, commitment of resources and formulation of buying and selling strategies.

(iii) Further strategic thinking will be called for on the part of STC management to ensure internal consistency among the above sets of policies and other connected policies so as to ensure overall viability.

(iv) STC management will have to *initiate action to create* sources of information on the basis of which strategic decisions could be taken.

(v) Appropriate skills will have to be developed among personnel to carry out the new tasks. First an assessment has to be made of the available skills and expertise. This will indicate the degree of internal competence. Trading operations are not all of the same kind and require different types of expertise and competence. For example, very broadly speaking trading in "commodities" differs from trading in "products". In the case of agricultural commodities supplies depend on the availability of surpluses in the market. Demand overseas depends upon the world crop situation. International trading is done through organised markets, called "commodity exchanges" or through direct government to government negotiation. Transactions are put through *via* telexes and telephones, exchanging information and instructions between STC officers and brokers. The number of transactions is limited and each transaction is of a very high value, often over a crore of rupees. Field trips for marketing are comparatively limited. Prices fluctuate erratically and there is a tendency for cyclic behaviour. On the other hand.

TABLE 4 : NUMBER OF ITEMS CANALISED AND DECANALISED

Year	Imports		Exports	
	No of Items Canalised	No of Items Decanalised	No of Items Canalised	No of Items Decanalised
Until 1967-68	5	0	11	0
1968-69	4	0	—	0

1973-74	23	0	14	0
1974-75	7	0	3	2
1975-76	1	9	8	0
1976-77	7	10	4	2
Total	174	19	45	4

in the case of "products", that is manufactured and proprietory items, the situation is radically different. Sources of supply can be developed through managerial action. Better values can be obtained and demand created through "brand" selling and strategies. Product management, merchandising, and marketing can help management get on top of the market as against being at the mercy of the market, as in commodity selling. Prices can be managed. The contribution of 'product' selling to improving the "terms of trade" is much more than in the case of 'commodity' selling.

Just as management of commodity trading and management of product trading require different strategic approaches and operational skills, different commodities and different products will have their own individualities from the point of view of management. The choice of products and markets has to be matched with available skills in the first instance. Thereafter skills have to be developed where they are lacking.

(vi) For the purpose of trading in commodities, a commodity specialist group will have to be developed. The choice of commodities will depend upon the availability of the concerned specialists. For the purpose of trading in products, the emphasis will no doubt be on an appreciation of all important developments with regard to the concerned product in its global context, but with a special stress on the constantly changing merchandising and marketing techniques and the emergence of competitive product substitutes in different parts of the world. This will involve a major strategic shift in so far as STC may have to go into brand selling on a substantially increased scale than it has ever attempted in the past. Product specialists will have to be developed individually for different product groups. New products can be taken up only along with the development of such expertise.

(vii) A time-horizon during which the above changes should be put through will also have to be determined in advance.

Operationally speaking, the above approach would involve a detailed understanding and appraisal of several factors. Final choices will depend upon the results of such appraisal, value judgments and degree of risk which STC management is willing to undertake.

Government could lay down the policy objectives; but cannot become a party to the decisions as regard to choice of management strategy or operational issues such as approval to individual contracts, their pricing and their profitability, save in very exceptional cases. If a practice had evolved to delegate some decisions to Board sub-committees, care should be taken to see that a government director is not a member of such sub-committees; otherwise the decision is likely to be pushed on to him. Likewise, in the matter of personnel to be employed, the manner in which the organisation is to be structured and the nature of schemes to be formulated to implement government's policy objectives etc, decisions should be substantially left to the STC management itself; subject of course, to the overriding condition that all actions are in conformity with government directives already issued on the subject.

RELATIONSHIP WITH GOVERNMENT

Can the STC go over to such a system of decision making? STC is a fully owned government corporation. It is government's responsibility to ensure that it performs effectively as an instrument of government's policy. Government is accountable to Parliament for such performance. If government does not take such part as it used to in the management of STC, how can government be expected to discharge such responsibility? There are two possibilities :

(a) have STC's task determined well in advance and hold STC management accountable for results, and

(b) require that all important decisions are taken with the knowledge, involvement and approval of government.

A number of positions between these two extremes are possible, depending upon various factors such as historical practice, operational styles of different executives and conscious attention devoted to a periodic review of systems and procedures. Perhaps current practice is more close to alternative (b) than alternative (a). Unless we move closer to alternative (a) and away from alternative (b), we shall be faced with the same problems as in the past.

As against the present practice of securing annual performance budgets in advance in quantitative terms from the STC, it might be advisable to obtain comprehensive budget proposals indicating not only quantitative targets, but also qualitative information such as (1) proposals, if any, for canalisation, (2) criteria for choice of new business and new schemes including proposals for new products/commodities to be taken up during the following year, having regard to social, developmental and commercial objectives. (3) guidelines for allocation of resources (4) indicative advance planning of trading on government account and (5) an integrated review of performance by reference to already established criteria.

Similarly, there could be frequent exchanges and consultation between the company and the government on strategic aspects of developments in the international environment, as monitored by the STC, with recommendation for advance planning or action by government including the additional role to be assigned to the STC. In other words, STC could function as a field agency monitoring

different sectors of the trading environment, not only through its own perspective, but also through the eyes of the government and making available to the government useful feedback for timely action. It is possible that the STC may like to limit its concern to the monitoring of the environment with respect to a few selected commodities which it can competently manage, instead of being asked at the last minute to take up the management of a product or commodity which has already become problematic in the Indian market.

WORKABILITY OF RECOMMENDATIONS

From the foregoing analysis, it would appear that to ensure success in the changed role which is envisaged for the STC, a basic change will be required in the relationship between government and the company. Government will have to limit its role to defining policy and giving advance instructions and directives. STC management will have to be rendered substantially autonomous and accountable to the government for a predetermined range of performance to be evaluated by pre-determined criteria. Will it be possible to meet this requirement and if it is not met, would the degree of success in achieving the objectives be affected adversely? The experience with regard to management of public sector enterprise so far shows that the probability of the requirement being met is low and also that the answer to the latter part of the question is in the affirmative unless special efforts are made both by government and the company to forge new relationships and new methods of working. The general experience so far shows that there are likely to be several difficulties in practice to a change-over in the pattern of relationships from the existing to the desired form. The present manner of functioning provides for an effective diffusion of responsibility. A ministry and a company can be mutually supportive as against the outside world. Secondly, the present style of management enables the system to acquire reserves outside the Consolidated Fund of India. A good deal of initiative and effort will, therefore, be needed to secure a break from the past and introduce new styles and new relationships. This may mean a change-over to performance orientation as against procedure orientation and a long term commitment to the strategy once developed. The staff will need to be reassured and given protection as also encouragement in changing over to a result based system. The competence to create a new managerial system is there; the compelling force has to be developed. Otherwise STC might end up wishing for some new external developments, which could enable it to continue the *status quo* and successfully operate along alternative one out of the three alternative approaches identified earlier.

II

Management Problems: Conclusions and Recommendations

The STC experience described in the preceding section has helped us to see how some unique management problems arise in a public sector corporation. It can be argued that STC is not a typical public sector undertaking and that the kind of problems described in the STC situation have little wider relevance. For, STC is a trading company whereas many of the important public sector companies are manufacturing concerns. In the STC, several buying and selling decisions involving large sums of money are taken regularly, whereas in the case of a manufacturing concern major investment decisions are taken only very rarely. Similarly, government officers are likely to feel more at ease with trading type of decisions as compared with decisions involving considerations of complex technology. Therefore, it can be argued that there is likely to be a much greater degree of managerial autonomy in the case of manufacturing concerns. In our opinion, this is not so. Even though capital investment decisions may be taken less frequently, there are a host of decisions including product mix decisions, pricing decisions, personnel decisions, etc, which are called for almost from day to day. The similarity or dissimilarity between STC and other undertakings does not depend on the nature of activity or the nature of the product mix, but on the fact that the ministry and a public sector company under its control often constitute a mutually supportive system. The management of the enterprise likes to lean on the ministry so that the ministry shares in its responsibility and the ministry, in turn, likes to let it do so, so that it can duly exercise effective control and enjoy a sense of real power. Together they face the outside world as a unified entity. Many people perceive a public sector enterprise to be synonymous with government and the perception is not called in question often.

The STC experience, therefore, has a much wider relevance and should help us see some typical problems of public sector corporate management in their true perspective.

We notice that STC has been making good profits and enjoys a good image on this score. We also notice that the good profits are a result of the choice of business mix which includes more of monopoly trading and very little by way of attention to the difficult task of social change and/or development. Whether by accident or design, the pattern of choice has been consistent for several years. We notice similar behaviour on the part of many public sector companies, all of which are either making good profits or trying to do so. As a general proposition, we can hypothesise that a public sector company which makes good profits acquires a reputation as a well managed company. Such reputation creates good morale all round, especially good employment morale. Once a company has earned such a reputation no questions are raised or exception taken to the degree of attention (or the lack of it) paid to socially oriented objectives etc. Conversely, every management wants to try its utmost to secure a high degree of profitability for its operations from year to year. This compelling need to improve its profit performance influences the manner in which choices are made in business decisions such as: less/more social objective, lower/higher prices for products etc. BHEL, HPF, IOC and EPIL are instances which show how reputations are made through superior profit performance. ECIL is an instance which shows how reputations are lost through failure to sustain the level of performance. We can, therefore, conclude that profit now has come to be regarded as the single-most important indicator of managerial efficiency and performance in the public sector.

Public sector companies are considered to be instruments of government policy. The need for adequate economic performance, measured by "profit", sets certain limits within which a corporation can be used as an instrument of policy. For example, in the STC case, government has intended to use STC as an instrument of policy for diversifying the export base, manage imports, check profiteering, assist in developing the small sector and backward areas and create employment. We notice that STC has done a good job of trading as an agent of government. It has not been

is an instrument in other [illegible]. In future also the likelihood of actual schemes being formulated in furtherance of these objectives will depend upon the extent to which they are likely to contribute to STC's profits in the near future. If profits are not seen as likely to accrue, there is going to be much lesser interest in thinking through such schemes and overall commitment will tend to be marginal. In the long run, such schemes may peter out and be rendered defunct. It is, therefore, desirable that the government clearly identifies the limits within which a particular corporation can function as an instrument of policy. Where different policies of government have contradictory objectives, e g, commercial efficiency, performance of developmental tasks, service orientation, etc, it may be unwise to use the same corporation as a combined instrument for all the policies. For, in the long run, the economic objective will tend to gain preference over all other objectives which are socially important and desirable. There is a risk of the latter being neglected altogether. Other instruments of policy should be thought of to give effect to such objectives. These may include development agencies financed independently for the tasks they are expected to perform. They may be entrusted with an expenditure budget and held accountable for securing certain specific qualitative and quantitative results. They need not make profits.

Identifying long term corporate goals in a public sector company is a great problem. These get decided, from time to time, by the Chairman and corporate management, the Secretary of the Ministry and the concerned minister. We need a long term corporate commitment expressed as an entrepreneurial perception, i e, in the form of a "concept of business" of the corporation — not in the form of components of the utility function but its vector. Such a commitment only will enable a corporation to acquire and develop a certain distinctive competence, which will give it a uniqueness of individual personality and character. However, in practice it is most difficult to satisfy this requirement. Political discontinuity at the ministerial level in government affects the continuity of policy at the corporate level. Similarly corporate managements themselves seek to surrender some of their autonomy to government.

It has to be accepted that the degree of autonomy, which managements of public sector corporations will enjoy, is bound to be limited as compared with the autonomy enjoyed by the managements of certain private sector companies. This is because the public sector company is an integral part of the public sector management system consisting of itself and its controlling ministry. Once this is realised, the nature and quantum of autonomy has to be worked out mutually by negotiation and exchange of views. There is no other standard solution. It will take some more time for government and companies to understand and appreciate the reality and seriousness of this proposition. With more experience of working the system, the concerned partners will acquire the necessary perspective and negotiating skills. Most public sector companies at present enjoy exclusive market power which is almost monopolistic in nature. It is natural for their management to want to continue to be in this situation as also be able to prescribe the desired levels of prices for their products. It is only situations where the product is marketed to the masses that the community controls those monopolies, e g, the post-card of P and T and second class fares in Railways. In other cases, "public" accountability is not a serious deterrent to the exercise of monopoly power by public sector companies. However, support of the ministry is needed. This is sometimes justified in the name of preventing "unhealthy" competition. It is this factor which prevents corporate managements from working out greater autonomy for themselves *vis-a-vis* the ministries; the discomfort and fear of losing the sympathy and support of the ministry in being able to perpetuate the monopolistic advantage. Support of the ministry is needed also for various other reasons from time to time. The company management is therefore willing, and sometimes even desirous, of shedding a part of its autonomy in favour of the ministry. We will continue to have instances like "77" cold drink being assigned to Modern Bakeries, without examining whether the product fits with the other product mix of the company. We will also have instances of two public sector trading companies insisting that a particular product may be "assigned" to each of them exclusively by a ministry order. Therefore, the degree of autonomy desired by corporate managements will be less than what may be considered ideal from the point of view of efficient management.

There will be no easy solutions to problems of management in the public sector. The limitations identified above will have to be accepted as facts of life and attempts made to optimise the efficiency of the system to which the unit in question happens to belong. Changes will come as more experience is gained and pressures mount on the public sector systems to show better performance.

Notes

[An earlier version of this paper was presented at the Third National Conference on Management Research held at the Indian Institute of Management, Calcutta The author is grateful to K Balakrishnan and N C B Nath for their comments.]

A Case Study

K P Kannan

This paper presents an economic evaluation of a land development project in a water-logged area in central Kerala — the Trichur Kole Land Development Project — recently undertaken by the state government with financial assistance from the Agricultural Refinance and Development Corporation.

The author attempts to distinguish the different groups that would be affected by the project, their respective net gains, and how they affect considerations of social profitability.

This attempt at a cost-benefit analysis specifically views the project from the point of view of its benefits and costs at market prices, its impact on farmers, labourers and poorer sections, and in terms of regional development and larger social values.

I

IN the selection of development projects, economic evaluation, understood in the sense of detailed social cost-benefit analysis, is being increasingly advocated by not only national planning authorities but also domestic as well as international financing agencies. The purpose is to assess the net worth of a project not merely from the point of view of the groups directly involved but also from the broader social angle. The latter alone would provide a total framework to judge a project's overall impact. In practice, however, very few projects are subjected to an economic evaluation in the above sense, in a systematic fashion. The problems encountered are not merely one of methodology; they are often much more basic in character. Some of them relate to the total absence of technical alternatives being considered at the stage of design, the tendency to rely on *ad hoc* methods of estimating costs and benefits — often inflating both or underestimating the former and overestimating the latter — and a clear lack of interaction of persons from different disciplines which is particularly crucial in agricultural projects. It is, however, not contended that these aspects of micro-level planning are the only important considerations, the intention is only to point out that they constitute the foundation for a sound project analysis.

The project under examination is a land development project in a water-logged area in central Kerala (Trichur Kole Land Development Project) recently undertaken by the state government with financial assistance from the Agricultural Refinance and Development Corporation. The project, as conceived by the authorities, is not an exception to the limitations mentioned earlier. However, our exercise is an attempt to demonstrate how best one can go about with the economic evaluation of a project of this kind. More often than not, both the project sponsors and financial institutions are satisfied with the evaluation which takes into account their respective costs and returns. The role of different groups involved and their respective net gains and how they affect the considerations of social profitability are hardly tackled. Particular emphasis has been given here to such aspects.

For our analysis, we had to rely in a number of places on independent sources of data and our informed judgments. On this basis, four alternative variants of the project were considered and their relative worth examined. Methodologically, the general principles of project evaluation have been applied although no attempt has been made to strait-jacket the analysis to any standard methodology of project evaluation in its entirety. The scope of our evaluation could have been expanded to take into account such aspects of 'externalities' as the impact on the ecology of the area and objectives like income distributional effects since the benefits accrue to different sections consisting of farmers from various size-groups and agricultural labourers. Omission of these aspects, especially the former, is due mainly to the non-availability of reliable data at a sufficiently disaggregated level.

First, a brief description of the project. The low-lying area extending from the banks of the Chalakudy river in Trichur district upto Ponnani in the north is known as Kole land. These lands covering an area of about 180 sq kms being below mean sea level remain water-logged for a major part — about seven months — of the year. Another similar land-depressed area in the state is the Kuttanad region covering an area of about 874 sq kms.

Though the Kole land area is very fertile because of the silt and other waste materials deposited during floods, the scope for regular cultivation of paddy is confined largely to a single crop (*punja*) during summer, between January and May. When the north-east monsoon tapers off by the end of November the fields are dewatered by pumping water out into the canals. To start with, the water requirements of this crop were being met from water stored in the channels and depressions but from 1957 onwards they are met mainly from the Peechi reservoir. The total area in the Kole lands under the summer crop is about 11,000 hectares.

A winter crop (*mundakan*) was first raised in the Kole lands in 1966 and winter cropping has gradually been extended to an area of 3,500 hectares. The major hazard this crop faces is of flooding during the north-east monsoon. The winter crop is raised by dewatering the fields immediately after the cessation of south-west monsoon in August. Temporary bunds are then constructed to prevent flooding during the north-east monsoon in October-November. The crop is of a shorter duration and the risks involved in raising this crop are considerably greater than the summer crop. Table 1 summarises the present cropping pattern in the Kole lands.

As part of the state government's programme of increasing the production of paddy through intensive cultivation measures — the scope for extensive cultivation is limited in Kerala because of the near-full utilisation of cultivable area — Kole land area was taken up for development.[1] Accordingly, a feasibility study conducted in 1969 suggested permanent bunding of the Kole fields and improving and widening of the Kole canals for preventing water-

TABLE 1 : PRESENT CROPPING PATTERN IN KOLE LANDS

	Summer Crop	Winter Crop
Duration of crop	January-April	September-December
Variety of paddy grown	C-28 (HYV)	IR-8 (HYV)
Water requirement (MM [a])	100.63	43.69
Source of irrigation	(i) Peechi reservoir (ii) Water stored in canals and depressions	(i) Rainfall (ii) Water stored in canals and depressions
Total cultivated area (hectares)	11,000	3,500
Average yield per hectare (quintals)	27 3	19.0
Total output (tonnes)	30,000	6,650
Major problems in cultivation	Shortage of water	Floods during N-E monsoon

TABLE 2 : ESTIMATED COST OF DEVELOPMENT OF KOLE LAND AND CONSTRUCTION OF CHIMONI DAM

Nature of Work	Estimated Cost (Rs in lakhs)
Kole Land Development	
Land acquisition	137.05
Earth work	331.37
Bridges and regulators	162.69
Miscellaneous	110.40
Total	741.51
Construction of Chimoni Dam	
Works	576.68
Establishment charges	46.13
Tools and plant	5.77
Less : Resale value of temporary buildings	1.62
Add : Audit and account charges, etc.	5.76
Total	632.72
Grand Total	1,374.23

logging of the area during the cropping season.

Based on this report but incorporating certain additional proposals, a Project Report was prepared in 1971 by the state Public Works Department. This proposal envisaged: (i) the construction of two storage reservoirs at the Chimoni and the Mupli tributaries of the Karuvannur river for purposes of irrigating a net area of about 20,200 hectares, (ii) the construction of two regulators for preventing the intrusion of salt water from the sea; and (iii) the development of 11,000 hectares of Kole and adjoining lands for raising an additional crop together with the construction of flood outlet to the sea at Kuttamangalam.

In 1973, the state Planning and Economic Affairs Department updated the above project and submitted it as the Chimoni-Mupli-Kole project to the World Bank for financial assistance. The project did not pass muster because (a) the benefits were overestimated in that the feasibility of raising an additional third crop was not clearly established and (b) the cost estimates were found to be on the high side. The Trichur Kole Land Development Project now under consideration can be said to be a scaled down, modest version of the 1973 project.

The project seeks (i) to construct permanent earthen bunds around the paddy fields to prevent flooding during the north-east monsoon thus enabling the cultivators to raise *mundakan* (winter) paddy crop in an additional area of about 7,100 hectares (i e, total 11,000 hectares *minus* 3,500 hectares already under *mundakan* cultivation *minus* 400 hectares to be submerged in the course of widening and improving existing water courses); (ii) to widen and improve the existing water courses for diverting the flood waters through new cuts into the lake and improving the existing flood banks and levels; and (iii) to construct a dam across the Chimoni river for irrigating not only 11,000 hectares of Kole lands but also 2,000 hectares of periphery land for the first *punja* (summer) paddy crop. (The Project Report itself does not claim the extension of irrigation to periphery land.) While the first two items come under the land development scheme to be implemented by the Kerala Land Development Corporation, the construction of the dam will be the responsibility of the Public Works Department.

The water requirements of the Kole lands (i e, the entire 11,000 hectares) for the summer crop are at present being met from (a) the Peechi Reservoir which was completed in 1957 and (b) water stored in the channels and depressions. The Chimoni dam is supposed to replace the Peechi reservoir as a source of irrigation for the Kole lands.

The cost estimates for the (1) development of Kole lands and (2) construction of Chimoni dam are summarised in Table 2.

II

Though the project, as formulated, does not make explicit the various technical alternatives which might have been considered for the purpose of this evaluation exercise, it is assumed that there still are at least two alternative ways of developing the same area. One is to undertake both the construction of Chimoni dam and development of Kole lands — both works to be completed within a period of four years — as provided for in the Project Report itself; the other, we believe, can be to undertake only the development of Kole lands but omit altogether the construction of the Chimoni dam.

The proposal for the construction of the Chimoni dam assumes that (a) the water now made available from Peechi reservoir for irrigating the summer crop in the Kole lands is not adequate and (b) that the substitute water made available during summer from the dam will be more than adequate and therefore stabilising. In short, both the construction of a dam across the Chimoni river and diversion of water from the Peechi reservoir are considered essential

Though the assumption regarding the inadequacy of the existing supply of water to Kole lands for the summer crop is extremely crucial to the proposal for constructing the Chimoni dam, it has not been elaborated upon in depth with supporting data in the Project Report. To examine the viability of this assumption, estimates of yield for the three taluks comprehending the Kole area were collected. The yield per hectare of 27.3 quintals (average for the five-year period, 1969-74) and 29.4 quintals (average for the three-year period, 1971-74) is one of the highest for the state. Since the yield figures, as mentioned above, refer to the 3 talukas and not to Kole area proper, it is very likely that the Kole area itself, being more fertile than other lands, had even higher yields. Hence it is difficult to accept the proposition that Kole lands are, at present, suffering from a shortage of water during summer. As for the winter crop, the question of shortage of water does not arise, the problem then is one of flooding

Further, information on the incidence of crop failure in the area was sought from the state Department of Agriculture. The information furnished showed that for the past five years the area adversely affected by shortage of

TABLE 3 : COSTS AND BENEFITS UNDER DIFFERENT PROJECT ALTERNATIVES

Costs	Benefits	Area Benefited (hectares)	Phasing
Alternative I			
Capital Investment			
Land Development	Additional winter (*Mundakan*) crop in Kole lands	7,100	
Construction of Chimoni Dam	Stabilisation of existing winter (*Mundakan*) crop in Kole lands	3,500	4 years
Annual Costs			
Cultivation of Paddy (Winter and Summer Crops)	Additional summer (*Punja*) Crop in the periphery lands	2,000	
Cultivation of coconut	Stabilisation of existing winter (*Mundakan*) crop in the periphery lands	2,000	
	Additional yield from coconut cultivation		
Alternative II			
Capital Investment			
Land Development	Additional winter (*Mundakan*) crop in Kole lands	7,100	
Annual Costs			
Cultivation of paddy (Winter crop)	Stabilisation of existing winter (*Mundakan*) crop in Kole lands	3,500	4 years
Cultivation of coconut	Additional yield from coconut cultivation		
Alternative III	As in Alternative I		8 years
Alternative IV	As in Atlernative II		8 years

water was only 5 per cent. In the circumstances, it appears that the second alternative of developing only the Kole land proper through the construction of permanent bunds and widening and improving water courses without the construction of Chimoni dam is quite feasible and worth examining. Whatever little shortage of water exists at present could be overcome by deepening the channels and depressions in the area, an alternative which finds no place in the project report. In fact, the main source of water for irrigating the summer crop in the Kole lands before the commissioning of the Peechi reservoir in 1957 was the channels and depressions.

The two alternatives mentioned above have been evaluated first with a phasing period of 4 years and then with an 8-year phasing. Thus, the exercise can be said to consider four alternatives (Table 3).

III

As a first step in this evaluation exercise, it was necessary to scrutinise the estimates of costs and benefits in terms of resource flows of the project over its life time. For the purpose of this exercise, evaluation has been attempted separately assuming life-spans of 20 and 30 years. However, it is felt that for a project of this type with a long physical life, evaluation on the basis of a somewhat longer life-span than is usually allowed for by financial institutions would be more reasonable.

Costs are divided into two major categories: capital costs and operating costs. Capital costs cover the costs of land development including construction of permanent bunds and construction of the Chimoni dam. The information given in the Project Report was subsequently supplemented by the project formulators by a breakdown of these costs in terms of their material and labour (skilled and unskilled) components. Neither the engineering details of these estimates nor the technical choices considered in various items of work have been scrutinised by us for the purpose of this exercise. Nevertheless, it should be borne in mind that the technical choices implicit in such estimates do have certain cost implications. The costs may be higher or lower depending on the materials used and designs adopted.

Operating costs include not only the maintenance of the capital assets but also the costs of cultivation of paddy and coconut in the project area. Though the Project Report does not envisage planting coconut trees along permanent bunds, costs as well as benefits of planting coconuts have been incorporated in this exercise because it would add, marginally though, to the net benefit of the project. For this purpose, reasonable estimate of the cost of coconut cultivation was relatively easy to make on the basis of the cost data collected by the Central Plantation Crops Research Institute, Kasaragod. Estimates, however, of costs of paddy cultivation incorporated in the Project Report were found to be at great variance with the data used in the Engineering Report on the Chimoni dam. Further both these sets of data were not found to comprehend the existing cultivation practices. They appear to have been worked out on the basis of some normative judgment of optimal system of cultivation. It was felt however that valuation on the basis of such estimates would be quite unrealistic.

Fortunately, data on cost of cultivation of paddy in Kerala has been regularly collected under a research programme of the Ministry of Agriculture, Government of India. These data were collected on the basis of accepted methods of sampling and data collection and hence carry a better scientific basis than other sources. The data on cost of cultivation for a representative area in the Kole lands are for the winter and summer crops. Comparison of these costs with the estimates given in the Project Report shows that the latter are overstated to the extent of 16 per cent (for summer crop) and 22 per cent (for winter crop). For the purpose of this evaluation exercise, the former cost estimates have been adopted.

The most important benefit of the project would be the yield from raising the second, that is, winter crop. To estimate the yield, a five-year, 1972-76, average for the three talukas in which the Kole lands fall, has been taken as the basis. It ought to be stated, however, that only 3,500 hectares of a total of 11,000 hectares of cultivable Kole land has so far been under winter crop. To the extent that land already brought under winter crop was of better quality and therefore had better yield the adoption of a five-year average yield could be said to result in overestimating the benefit of this project. At the same time, it cannot be overlooked that the entire Kole lands are likely to benefit during winter from the fact that permanent bunds will reduce the incidence of flooding. So there is scope for improvement in yield for the entire area.

TABLE 4 : SUMMARY OF FLOW OF BENEFITS AND COSTS (Rs IN LAKHS)

* Rs 1310/- hectare of equal instalments for 11 years.

However, this is an aspect considered separately. The major benefit of the project is claimed in terms of improvement in yield from the land already under cultivation for one or two crops. It is not quite clear what the basis is for expecting improvement in the yield from summer crop. As was noted above, the average yield is high. It could be argued that since the same land will hereafter be used to raise two crops, the yield from the crop will decline though the overall yield per hectare from the two crops taken together is very much higher than before. Therefore, in this exercise no credit has been taken for improvement in yield per hectare, as far as summer crop is concerned. Credit has been taken however at 20 per cent of the existing average yield of winter crop as likely to accrue from improvement on account of better protection afforded to this crop against flooding. This improvement in yield per hectare, it is assumed, can be brought under winter crop as a result of this project. No additional cost has been provided for in this evaluation so that the improvement in yield allowed for in the estimates of yield of winter crop raises the net benefit from the project by the full amount.

Thus, for the purpose of this exercise, the paddy output is projected at the rate of 27.3 quintals per hectare for the summer crop and 23 quintals per hectare for the winter crop as against the estimate of 30 and 37.5 quintals respectively given in the Project Report.

It must be added however that to project output per hectare on the assumption of existing cultivation practices which is implicit in the adoption of a five-year average yield ignores that yield could be much higher than what it actually is, if (a) better water management practices are followed like supply of adequate water at critical periods during summer crop and (b) still better protection is available from floods to the winter crop. It could lead to the increased use of inputs like fertilisers, pesticides, etc, which would raise the cost of cultivation but would also simultaneously result in higher yields. On this basis it is possible to talk of 'expected benefits' at a higher level of technology of cultivation. However, to estimate such 'expected benefits' is difficult in the absence of data from studies on comparable land with similar agroclimatic conditions.

The pricing of paddy is the next important problem to tackle in order to evaluate the benefits of the project. For rice/paddy, dual pricing obtains in Kerala where some 40 per cent of the rice consumed is distributed through fair price shops and the balance is sold in the open market at a clearing price much above the fair price. While the adoption of the fair price would underestimate the benefit of the project, to adopt the market clearing price would overestimate the benefit. In a situation like Kerala's, where the paddy/rice is regularly purchased in

	16 Land Acquisition (Chimoni Dam)	12.5	12.4	12.3	12.5	12.4	12.3

large quantities from outside the state, the price could be reckoned as the relevant opportunity cost of paddy/rice produced additionally within the state. Fortunately, the data on the quantities and prices of rice purchased from other states by the Kerala State Civil Supplies Corporation for the past five years are tvailable. The weighted average price of rice thus purchased comes to Rs 2,171 per tonne.

Since the additional output of paddy due to the project is only marginal compared to the state's annual demand for additional quantities from outside the state, it is not likely to affect the price of rice procured from other states. Therefore the valuation of the additional output of paddy in the Kole lands on account of the project on the basis of the price paid to rice purchased from outside the state appeared to be the most reasonable course to adopt. The paddy-to-rice conversion ratio has been taken at 3:2.

The benefit in terms of coconut output has been estimated on the basis of (a) the yield data for Trichur district nd (b) the average farm price for the 5-year period, 1970-71 to 1974-75.

A flow chart of costs and benefits for Alternatives I and II of the project, i e, the alternatives with 4-year time phasing for the completion of capital construction, was prepared after making the adjustments and corrections on the above lines. The detailed breakdown of items in terms of resources, skilled and unskilled labour and their time phasing have been done on the basis of whatever information is given in the Project Report and subsequent discussions with the concerned officials. A summary of the detailed flow chart is presented in Table 4.

The items classified as transfer payments refer to cash transfers from one group to another which are not resource costs to the project. When viewed from the point of respective groups they constitute as costs/benefits to the group concerned. But they get cancelled when viewed from the point of view of the society as a whole.

IV

It will be noted that the costs and benefits given in Table 4, though considerably modified and adjusted, are still at market prices. Though the market prices may not necessarily reflect the social opportunity cost of resources, it is always useful to start with an evaluation by using market prices. After all, the project costs are incurred largely through the market and its benefits too usually accrue in terms of marketed, or at least marketable, goods and services.

It may be recalled that the life-span of the project is taken to be 20 and 30 years. In a sense, an agricultural development project of this nature may be considered permanent but for purposes of evaluation a life-span of more than 30 years is unlikely to make any perceptible influence on the net worth of the project, even on the basis of a very moderate rate of time discount. Since no single cut-off rate of discount has been stipulated for projects of this nature, three alternative discount rates

TABLE 6: ESTIMATES OF UNEMPLOYED MANDAYS AVAILABLE IN TRICHUR DISTRICT AND KOLE AREA

(in lakhs)

	Item	Trichur (5 Talukas)	Project Area (3 Talukas)
1	Total population (1971 Census)	21.29	16.12
2	Total rural population (1971)	18.79	14.02
3	Annual growth of population (per cent)	2.61	2.61
4	Total Rural population in 1975	21.36	15.94
5	Total workers (rural)	6.19	4.62
	Estimate of unemployment based on 1965 survey		
6	Unemployed persons : 12 per cent of workers	0.74	0.55
7	Underemployed persons : 29 per cent of workers	1.79	1.34
8	Mandays available of the unemployed @ 300 days per annum	222.00	165.00
9	Mandays available of the underemployed @ 150 days per annum	268.50	201.00
10	Total=(8)+(9)	490.50	366.00
	Estimate of rural unemployment based on NSS, 12th round, Kerala, 1970		
11	Unemployed persons: 3.2 per cent of rural population	0.68	0.51
12	Underemployed persons: 30 per cent of workers	1.86	1.39
13	Mandays available of the unemployed @ 300 days per annum	204.00	153.00
14	Mandays available of the underemployed @ 150 days per annum	279.00	208.50
15	Total=(13)+(14)	483.00	361.50

were applied and the flow chart reduced to present values as given in Table 5.

The net present value of the project at market prices — NPV(M) — indicates its net worth in terms of the discounted surplus it is expected to generate after allowing for its various costs, capital and recurring, during its expected life-span. At market prices, the net benefits of Alternative I can be worked out as under from Table 5.

$$NPV(M) = [(1) + (2) + (3) + (4) + (5) + (13)] - [(6) + (7) + (8) + (9) + (10) + (11) + (12)]$$

Items (14) to (16) are not included since they are merely transfer payments. The results, given below for the above equation, show that the Alternative I of the Project is not viable at 10 and 12 per cent rates of discount with a 20-year year life-span.

Rates of Discount (per cent)	NPV(M) (Rs lakhs)
Life-span 20 years	
8	+105
10	−20
12	−116
Life-span 30 years	
8	+281
10	+81
12	−42

If the life-span is taken at 30 years the net returns are positive at 8 and 10 per cent rates of discount. However, even with a larger life-span of 30 years the project is not viable at market prices at 12 per cent rate of discount.

V

For the purpose of social benefit-cost evaluation, the major item that calls for correction is the cost of labour, that too unskilled labour.

In a state like Kerala with chronic problems of unemployment it is hardly necessary to emphasise the importance of examining the employment potential of new development projects. Due to the predominance of three crops in Kerala's agriculture, whatever additional employment has to be generated within agriculture will have to be connected largely with rice cultivation and allied activities.

The employment potential of a project could be examined in terms of its own technical alternatives and also between similar projects. The scope for such an analysis is rather limited in this exercise. However an attempt to quantify the employment potential of the project is worthwhile.

For land development including the construction of permanent bunds, the man-power requirements have been estimated at 55 lakh mandays of unskilled labour and 17 lakh mandays of skilled labour, both direct and indirect. For the construction of the dam, man-power requirements are nearly 38 lakh mandays of unskilled and 9 lakh mandays of skilled labour. This employment will be spread over a period of four years.

Also, there will be a step-up in recurring employment due mainly to the additional winter crop in an area of 7,100 hectares and additional summer crop in 2,000 hectares. When the project is completed the additional employment thus generated will be 18 lakh mandays of unskilled labour per annum.

Having got the estimate of labour input of the project, recurring and non-recurring, the most important question for purposes of assessing its social profitability is whether wages actually paid to unskilled workers can be taken as reflecting the social opportunity cost of labour. The agricultural labourers in the project area, as in the rest of rural Kerala, do not have continuous employment throughout the year. Further, these agricultural labourers belong to the landless category and hence are unable to utilise their family labour for any other land-based occupation. Alternative employment opportunities are also very few as there is hardly any industry worth mentioning which could absorb the surplus labour in agriculture. In the project area, the whole problem of unemployment is acute in view of the fact that only one crop a year is raised in more than two-thirds of the Kole lands.

In order to determine the social cost of labour involved in the project, we need to have some idea of the magnitude of unemployment in the project area. As the data of the latest Sample Survey on employment and unemployment in Kerala conducted by the State Bureau of Economics and Statistics are yet to be processed, we have depended on two earlier surveys[2] of 1965 and 1970, for the estimates of unemployment in Trichur district as a whole and also the project area (covering three talukas). It can be seen from Table 6 that in the project area, the available mandays of the unemployed comes to well over 150 lakhs and that of the underemployed to over 200 lakhs per annum. As against that, as can be seen from Table 7, the requirement of unskilled labour for capital construction and annual additional paddy cultivation under Alternatives I and II of the project does not exceed 23.25 lakh mandays in any single year.

While the availability of unemployed mandays is much higher than the maximum requirement of labour in capital construction under Alternative I, it need not necessarily follow that the

History & Business of the company

The company was incorporated on 22nd February 1975 as a public limited company in the State of Andhra Pradesh An industrial licence No CIL 50C777 dated 5th February 1977 has been obtained by the Company for the establishment of a new industrial undertaking to manufacture Semi-Conductor Devices. This industrial licence has been further extended to 3rd February 1980.

Promoters

The company has been promoted in the joint sector by Andhra Pradesh Industrial Development Corporation and M/s Yamuna Digital Electronics (Pvt) Ltd for manufacture of semi-conductor devices

Project

The company is setting up a project for the manufacture of 5 million semi-conductor devices at Pattancherevu in Medak district of Andhra Pradesh

Raw materials & Power

The major raw materials required are Monocrystalline silicon, wafers, masks and are to be imported The indigenous raw materials required are locally available The A P State Electricity Board has agreed to supply the required power to the company

Construction schedule & progress made

The company hopes to install the entire machinery by March 1979 and trial runs are expected to commence in April 1979 The unit will go into full production by May 1979

Business prospects & profitability

The demand for electronic goods is steadily increasing and the company expects a reasonable growth for its semi-conductor devices subject to unforeseen circumstances The directors expect that the company would earn sufficient profits to pay a reasonable dividend within a reasonable time

Project cost & sources of finance

The project is estimated to cost Rs. 335 lacs and will be met as under

	Rs in lacs

Above 10	1.2	0.7	20.7	12.3
	184.4	100.0	167.7	100.0

social cost of labour can be assumed to be zero. In any one normal year, January to April is the work period for the summer crop and September to December is the work period for winter crop. The latter is raised at present only in part of the project area. Naturally therefore, the peak agricultural demand for labour occurs during January to April when practically everyone classified as underemployed finds work.[8] Secondly, our estimates of the unemployed include persons both in the agricultural and non-agricultural sectors and even here all those unemployed may not be actively seeking work. Thirdly, most capital construction of the type envisaged in the project is such that it is bound to slow down during monsoon time because of floods. Therefore much of it will have to take place within the remaining seven months or so. Once, however, capital construction is started it has to go on at a certain pace.

The crucial factor in determining the social cost of unskilled labour is still the number of unemployed within the project area who can be utilised without any direct or indirect social cost. For those unskilled labour outside the vicinity of the project area, their employment would involve an element of additional cost in terms of transportation to the project site from different parts of the three talukas in which the project is spread over. Assuming that the project catchment area is 20,000 hectares, we have attempted an estimate of the unemployed mandays in this area. The assumptions underlying our estimate are spelled out in Table 7. It may be noted that the availability of unemployed mandays in the project catchment area comes to a little over half the average annual requirement of unskilled labour days for capital construction under Alternative I. If we allow for the additional man-power requirements for the extension of winter crop cultivation in the third and fourth years, the available unemployed mandays for the four-year construction period as a whole would work out to half the number required. Therefore, for unskilled labour required for capital construction under Alternative I the social cost has been placed at half the wage cost at market prices. Hence, a premium of (—) 0.50 has been applied.

Under Alternative II, the unskilled labour required for capital construction only is slightly more than half that under Alternative I and equals the availability of unemployed mandays in the project catchment area. However, since additional labour will be required for the extention of winter crop cultivation in the third and fourth years in the areas already brought under additional cultivation by constructing permanent bunds, there would still be a case for assuming the social cost of labour to be somewhat above zero. Since Alternative II has been posed in this exercise as a possible option to Alternative I, it has been decided out of abundant caution to place the social cost of unskilled labour for capital construction at one-fourth of the wage cost at market prices. Hence, a premium of (—) 0.75 has been applied for this variant; that is, in our arithmetical calculation 75 per cent of the wage cost will be treated as social benefit and the remaining as social cost.

Once the project is completed, the demand for additional labour will arise mainly from the winter crop to be raised in an additional area of 7,100 hectares. This demand could be easily met from the unemployed and underemployed agricultural labour force in the project area. Since the project envisages the construction of permanent bunds, labour which is currently employed on annual repairs to temporary bunds before the winter crop will, in fact, become redundant. Therefore, the social opportunity cost of labour to be employed on land additionally brought under winter crop is taken as zero.

As for the skilled component of capital construction, though unemployment among skilled labour cannot be ruled out, it is assumed for the purpose of this evaluation exercise that all such labour will have to be withdrawn from other employment; the number of persons of various skills required for construction work is unlikely to be readily available even when the project area has a surplus of skilled labour as a whole. Thus no correction has been made in the costing of skilled labour.

Thus, for purposes of social evaluation of the project, there will be considerable reduction on the cost side and therefore increase in net benefit from the project. While no direct weightage has been given to employment, the objective of employment generation can be said to have been indirectly in-

corporated in this evaluation exercise by costing labour at its social price.

It may be recalled that major corrections and adjustments such as the pricing of paddy and coconut were incorporated in the evaluation of the project at market prices [NPV(M)] itself. The only further correction introduced for purpose of social, as distinct from market, evaluation of the project related to the pricing of unskilled labour. Unskilled labour accounts for 42 per cent of the cost of construction of dam and 43 per cent of the cost of land development and between 48 and 51 per cent of the cost of cultivation of paddy. The cost of materials and skilled labour has been taken at market prices on the assumption that social values thereof are not very different — an assumption, though arguable, which is unlikely to affect materially the conclusions of the evaluation.

For reasons explained above, while the social cost of unskilled labour in capital construction (items 6-c and 8-c of Table 4) has been taken at half the market wage rate, that of the unskilled labour employed in cultivation and allied year-to-year operations (items 7-c, 9-c, 10-b, 11-b and 12-b of Table 4) has been taken at zero wage. Therefore, while the social benefit of employing unskilled labour in the project is only half the wage cost attributable to such labour in capital construction, the social benefit of employing unskilled labour in raising crop on additional land will work out to be the full wage cost incurred thereon from year to year. Symbolically, the net social benefits will be given by the following equation[4] (as applied to Table 5).

$$NPV(L) = -\lambda\,[(6-c)] + (8-c)] - \phi\,[(7-c) + (9-c) + (10-b) + (11-b) + (12-b)] - (13) \text{ where } \lambda = -0.50 \text{ and } \phi = -1.00$$

so that

$$NPV(L) = 0.5\,[(6-c) + (8-c)] + [7-c) + (9-c) + (10-b) + (11-b) + (12-b)] - (13).$$

If the net social benefit of employing unskilled labour, as indicated above, is added on to the market valuation previously arrived at, it will give the net benefits of the project at social values.

Thus, for the *farmers* as a group the net benefits would be given by the following formula as applied to Table 5:

$$NPV(F) = [(1)+(2)+(3)+(4)+(5)+(13)+(15)+(16)] - [(7)+(10)+(11)+(12)+(14)]$$

The benefits of the farmers include not only the income from the cultivation of paddy and coconut (items 1,2,3, 4 and 5) but also the savings effected in repair of bunds and compensation received from the government for the land for constructing bunds and the dam (items 13, 15 and 16). Under the project as it is conceived, while the construction of the dam is to be carried out by the state government without recovering any part of the cost, land development, it is expected, will be financed out of loan from the Agricultural Refinance and Development Corporation and the farmers are liable to repay, over a period of 11 years, only the cost incurred on land development. Therefore, the costs, to be incurred by the farmers are the maintenance of bunds (item 7), cost of cultivation of coconut and paddy (items 10, 11 and 12) and repayment of loan (item 14). The net benefits of farmers, given below, reflect the time pattern of costs and benefits of this group. Farmers do gain substantially from this project.

[illegible] Alternatives I and II

	Alternative I (20 Years)			Alternative II (20 Years)		
	Discount Rate (Per Cent)			Discount Rate (Per Cent)		
	8	10	12	8	10	12
At market prices	+0.14	−0.02	−0.15	+0.98	+0.70	+0.48
At social prices	+1.50	+1.14	+0.89	+3.86	+3.24	+2.73
		30 years			30 years	
At market prices	+0.35	+ .11	−0.05	+1.36	+0.96	+0.65
At social prices	+1.89	+1.42	+1.08	+4.73	+3.80	+3.33

Note · Net Benefit Cost ratio is defined as the amount of *net benefits* generated per unit of capital investment. That is $= \frac{\text{Present Value of Net Benefits}}{\text{Present Value of Capital Costs}}$

TABLE 12: NET PRESENT VALUES OF BENEFITS OF KOLE LAND DEVELOPMENT PROJECT UNDER ALTERNATIVES III AND IV

(*Rs lakhs*)

Item	Alternative III (20 years)			Alternative IV (20 years)		
	Discount Rate (Per Cent)			Discount Rate (Per Cent)		
	8	10	12	8	10	12
Benefits at market prices NPV (M)	+26	−61	−105	+283	+196	+149
Benefits in terms of social prices NPV (S)	+732	+531	+397	+771	+604	+493
		30 years			30 years

Life-span 20 years	
8	+1020
10	+872
12	+754
Life-span 30 years	
8	+1204
10	+988
12	+831

Unskilled labourers: It will be recalled that the social gain of generating additional employment of unskilled labour NPV(L), was arrived at by taking half the unskilled wage component of capital costs (under Alternative I) plus the entire wage component of recurring costs, NPV(S) = NPV(M) + NPV(L).

Rates of Discount (Per Cent)	NPV(S) (Rs lakhs)
Life-span 20 years	
8	+1176
10	+900
12	+683
Life-span 30 years	
8	+1522
10	+1119
12	+826

The implications of the social valuation thus arrived at are worthwhile stating. Clearly, net social benefits of a project — NPV(S) — can be positive even if the net benefit of that project at market values — NPV(M) — is zero or negative. But the social justification of the project is then wholly dependent on the additional employment of unskilled labour it generates. It means also that one or more parties involved in the project are disaggregated in terms of the principal groups involved therein.

VI

Three principal groups have been identified with respect to this project: (i) the farmers, (ii) the agricultural labourers (unskilled labour) and, (iii) the project authority (i e, the state government). The third group is taken to include all public agencies like the Land Development Corporation and financial institutions.

When looked at from the point of view of these separate groups, the relevant prices are market prices and not social prices. Social prices are relevant only when the project is viewed from the society's point of view.

Therefore the net addition to their income from employment in the project could be taken to be half the yearly wage during the period of construction. Once the project is completed, the labourers will secure additional employment through raising of a winter crop on 7,100 hectares of Kole lands. But the [illegible] of employment now available on repair of temporary bund will also have to be allowed for. Thus the net social gain of employing unskilled labourers — NPV(L) — will be half the wage cost in capital construction plus the entire wage component of recurring costs minus the loss of employment on repair of bunds under Alternative I.

Rates of Discount (Per Cent)	NPV(L) (Rs lakhs)
Life-span 20 years	
8	+1071
10	+920
12	+799
Life-span 30 years	
8	+1241
10	+1028
12	+868

However, from the point of view of income redistribution the agricultural labourers as a group obtain additional income equivalent to the entire wage cost at market prices less the wages now obtained on repairs of temporary bunds. The present value of such income accruing to the labourers as a group is given by R(L).

Rates of Discount (Per Cent)	R(L) (Rs lakhs)
Life-span 20 years	
8	+1245
10	+1088
12	+961
Life-span 30 years	
8	+1415
10	+1196
12	+1030

Project Authority: As already stated, the expression 'government' has been used to include all public agencies connected with this project, directly or indirectly. The costs to be taken into account in this context are the costs of construction of the dam and its maintenance (items 8 and 9), development of land (item 6) and compensation for acquisition of land (items 15 and 16). The returns of this group comprise only of repayment of loan by the farmers (item 14). Thus the net gain from the project authority's view point would be:

$$NPV(G) = (14) - [(16) + (8) + (9) + (15) + (16)]$$

As can be seen from the results of NPV(G) given below, because the authority has to incur certain costs (like dam construction and its maintenance) without recoupment and also bear the initial investment on land development the returns have turned out to be in the negative for all the three rates of discount even with a longer life-span of 30 years.

Table [illegible]: Net Benefit-Cost Ratios of Kole Land D[illegible] Project under Alternatives III and IV

	Alternative-III (20 years) Discount Rate (Per Cent)			Alternative-IV (20 years) Discount Rate (Per Cent)		
	8	10	12	8	10	12
At market prices	+0.04	−0.10	−0.18	+1.19	+0.87	+0.71
At social prices	+1.08	+0.84	+0.67	+3.24	+2.68	+2.35
	30 years			30 years		
At market prices	+0.29	+0.16	−0.06	+1.73	+1.47	+0.95
At social prices	+1.53	+1.15	+0.88	+4.21	+3.34	+2.79

Table 14: Capital Cost (Undiscounted) of Land Development in Kuttanad and Trichur Kole Lands

Region	Rs Per Hectare: Including Cost of Land Acquisition	Rs Per Hectare: Excluding Cost of Land Acquisition	Area Benefited (hectares)
*Including Infrastructure Works**			
Kuttanad	4,673	4,557	52,000
Trichur Kole	11,803	9,872	12,400
*Excluding Infrastructure Works**			
Kuttanad	3,846	3,730	52,000
Trichur Kole	7,130	5,812	10,400

* Infrastructure works for the Kuttanad Development Project consists of improvements to the channel to the Thottappally Spillway, protective works to the bunds affected by the spillway and diversion of Idukki tail race water from the Muvattupuzha basin with a total outlay of Rs 430 lakhs. The infrastructure works in Kole Land Development Project is that of the construction of the Chimoni dam with a total outlay of Rs 632.7 lakhs

Rates of Discount (Per Cent)	NPV(G) (Rs lakhs)
Life-span 20 years	
8	−915
10	−892
12	−870
Life-span 30 years	
8	−923
10	−897
12	−873

The sum of the net benefits of the above three groups valued at social prices should give the net social benefits of the project referred to in Section V.

VII

In sections IV and VI, evaluation results were given for Alternative I. Under Alternative II, costs on construction of the dam and its maintenance (items 8 and 9), cultivation of summer crop (item 12) and compensation for land acquisition for constructing the dam (item 16) will not be incurred Correspondingly, some of the benefits (items 3 and 4) will also not accrue. Therefore, the net benefits of the project under the different equations will be as follows:

$$NPV(M) = [(1)+(2)+(5)+(13)] - [(6)+(7)+(10)+(11)]$$

$$NPV(F) = [(1)+(2)+(5)+(13)+(15)] - [(7)+(10)+(11)+(14)]$$

$$NPV(L) = -\lambda\,[(6-c)] - \phi\,[(7-c)+(10-b)+(11-b)] - (13)$$

Where $\lambda = -0.75$ and $\phi = -1.00$ so that

$$NPV(L) = 0.75\,[(6-c)] + [(7-c)+(10-b)+(11-b)] - (13)$$

$$NPV(G) = (14) - [(6)+(15)]$$

$$NPV(S) = NPV(M) + NPV(L) = NPV(F) + NPV(L) + NPV(G).$$

Life-span 20 years	Rates of Discount (per cent) 8	10	12
	Rs lakhs		
NPV(M)	+273	+191	+127
NPV(F)	+605	+525	+462
NPV(L)	+804	+686	+592
NPV(G)	−332	−334	−335
NPC(S)	+1077	+877	+719
Life-span 30 years			
NPV(M)	+380	+259	+171
NPV(V)	+713	+593	+506
NPV(L)	+940	+772	+705
NPV(G)	−333	−334	−335
NPV(S)	+1320	+1031	+876

The results of Alternative II, presented above, bring out that the project becomes [illegible] at market prices for all the three rates of discount for both 20 and 30 years. At the same time, it has also helped to reduce the project authority's (denoted as government) loss to a considerable extent. Compared to Alternative I both at market and social prices, Alternative II comes out better even though one of the parties involved in the project, (the government) will still face a net drain of a little over Rs 3 crores. The reason for Alternative II emerging as a better variant is that the reported shortage of water, for which the construction of the dam is proposed, is not reflected in the yield rates of the paddy crop in the Kole lands.

VIII

Every project has a regional or local dimension to it. What is attempted in this section is only a measure of the direct impact of the project on the region. This could be done by identifying the outflows and inflows and then calculating the net inflow to the region

Under Alternative I, the net benefit to the region would be given by

$$RD(T) = [(1)+(2)+(3)+(4)+(5)+(6-c)+(8-c)+(9-c)+(15)+(16)] - [(7-a)+(7-b)+(10-a)+(11-a)(12-a)+(14)]$$

Under Alternative II, this would be

$$RD(T) = [(1)+(2)+(5)+(6-c)+(15)] - [(7-a)+(7-b)+(10-a)+(11-a)+(14)]$$

Apart from the direct impact, there could be some indirect impact as a result of spending some part of the direct income generated by the project. But the indirect impact can be measured if it was sufficiently known to what extent the additional income generated locally tended to be spent on goods and services produced within the region. Since this is unknown, no attempt has been made in this exercise at measuring the indirect impact of the project on the region.

IX

Given a choice between projects, or different variants of the same project, it is worthwhile examining how the benefits are distributed between the various income groups of beneficiaries

This could be done first by assessing the net benefits accruing to the weaker sections and thereby assigning such benefits a higher weight than that to benefits accruing to other beneficiaries. In practice, the difficulty is one of assigning the right weights because they are seldom laid down at the national (or regional) planning level. However, one may still assess the impact of a project on the sections which are broadly identified as poor.

Two groups which could safely be identified as poor are the small farmers and the agricultural labourers. Small farmers have been defined as those with a land-holding of less than 2 hectares. It must be conceded straightaway that the 'poverty' of a small farmer is not the same as that of the 'poverty' of an agricultural labourer and that the clubbing together of the two groups is not, in any way, intended to equate poverty of the two groups. In fact, if agricultural labourers alone were to be identified as poor, the net benefits accruing to them are already given by R(L).

From the point of view of redistribution, it will be still relevant to ask what proportion of the benefit accruing to the farmers as a whole goes to small farmers. In the absence of data on the distribution of land separately for the Kole lands, information on land distribution in Trichur district has been used on the assumption that the pattern of land distribution will not be significantly different in the Kole lands from that of the district as a whole. Table 8 gives the pattern of land distribution for the Trichur district.

It may be noted that the distribution of land in the district is highly skewed, with 87 per cent of the cultivators having holdings below two hectares accounting for only 38 per cent of the area. On the other hand, 13 per cent of the cultivators with a holding of 2 hectares and above account for 62 per cent of the area. Hence, the net benefits accruing to the small farmers in the project area is taken to be 38 per cent of the benefits accruing to the farmers as a whole.

Under Alternative II, this will be

$$R(SF) = 0.38\,[(1)+(2)+(3)+(4)+(5)+(13)+(15)+(16)] - [(7)+(10)+(11)+(12)+(14)] = 0.38\,[NPV(F)]$$

under Alternative II, this will be

$$R(SF) = 0.38\,[(1)+(2)+(3)+(5)+(13)+(15)] - [(7)+(10)+(11)+(14)] = 0.38\,[NPV(F)]$$

The net benefits of the poorer sections as a whole would be given by

$$R(PS) = R(SF) + R(L).$$

X

The results in terms of net present values of benefits of Alternatives I and II are summarised in Tables 9 and 10. With a 20-year life-span, Alternative I is viable in terms of market prices, of course as adjusted in this exercise, at a rate of discount of 8 per cent. Alternative II is viable even when the rate of discount is higher. With a 30-year life-span, Alternative I becomes viable in terms of market prices even at 10 per cent rate of discount. However, in terms of social valuation, Alternative I can be seen to show a higher net present value for rates of discount of 8 and 10 per cent and almost as much net present value for the rate of discount of 12 per cent when compared to the corresponding net present value of Alternative II. It will be misleading however to infer from this that in terms of social valuation, Alternative I is at least as good, if not better than, Alternative II. Here, it is relevant to relate the net present value to the capital cost for each alternative. Table 11 gives the ratios of net benefits at market and social values to corresponding capital costs. It can be seen that the ratios for Alternative II are between two and a half to three times higher than the corresponding ratios for Alternative I. Thus the net benefit, social as well as market, likely to be realised per unit of capital investment is higher for Alternative II than Alternative I.

It will be recalled that for both Alternatives I and II it is assumed that construction will be completed in the first four years. How realistic is it to make this assumption? There could be doubt on this score, particularly in the light of recent experience within Kerala with respect to agricultural projects in general and a project of similar type, namely Kuttanad Development Project, in particular. To what extent the factors which were responsible for the delay in the completion of the earlier scheme have been provided for in the formulation of the Project now evaluated is not clear. In case, however, the completion of the Project is likely to take much longer than originally expected, evaluation results are bound to be adversely affected. This can be seen from the results summarised for Alternatives III and IV (Tables 12 and 13). Alternative III includes all the costs and benefits in Alternative 1 but with a phasing of the construction work over 8 years. Similarly Alternative IV is an 8-year phasing of Alternative II. It must be added that in the absence of details about the time phasing, in physical terms, of the various items of capital construction it is difficult to say whether or not the time phasing of financial expenditure is realistic.

The reduction in net benefits at market social valuation on account of delays in construction can be seen to be quite considerable. Thus the smaller the delay in completion, the larger will be the net benefits of the project. At the same time, the ratios of the net benefits to corresponding capital costs are considerably higher for Alternative IV and Alternative III.

Thus on the basis of this evaluation exercise, the choice clearly seems to be for undertaking the project without the Chimoni dam. It must be added however that, as can be seen from Table 12, the capital cost per hectare of land even without the Chimoni dam works out to be nearly one and a half times as the corresponding figure under the Kuttanad Development Project.

XI

The exercise is rather limited in scope in the absence of both the kind of detailed data necessary for a much more thorough socio-economic evaluation and also the specification of other technical variants of the project. The project, as conceived, envisages principally the construction of permanent bunds to prevent flooding during winter and construction of a dam across the Chimoni river for supplying adequate water during summer. The construction programme would, it is assumed, be completed in a period of four years. The two alternatives to it considered for the purpose of this evaluation are strictly speaking, not technical variants. One possible variant could have been the deepening and extension of channels and depressions which used to serve as the principal source of water for irrigation prior to the construction of Peechi

...voir but are naturally out of use ...ly. Could these not be developed at ... lower cost and in shorter period ... the proposed Chimoni dam to overcome whatever little shortage of water exists at present? Evidently, the present thinking in official circles is not well disposed to consideration of such not-too-imposing variants.

Also though for the purpose of this exercise, some corrections were made to cost and benefit estimates — as for example to the costs of cultivation of paddy and to the likely additional output of paddy and its price — the capital cost estimates have been left virtualy untouched. Only for the social evaluation is the price of unskilled labour assumed to be considerably below the market wage. The intention is both to incorporate thereby the employment objective into our evaluation and to treat at least a part of the wage paid as 'benefits' because it accrues to people whose employment and income levels need to be raised. However, the underlying assumption needs being highlighted, namely that labour is mobilised largely in such a way that it coincides with the period of maximum unemployment in the area. Drawing labour for the project during periods when agricultural operations require the available local labour does not obviously constitute a social benefit.

The exercise has also demonstrated that delay in implementing the project will result in considerable reduction of net benefits accruing to all parties concerned. Even the assumption of prolongation by four years may, in the light of experience in implementing similar projects in the state, seems to be on the conservative side. Construction of many irrigation and other projects started as far back as 12 years are nowhere near completion.

It is important to note that even with a modest version of the project, namely Alternative II, the capital cost of land development per hectare turns out to be one-and-a-half times the cost of a similar project undertaken for the Kuttanad region. Interestingly the cost estimates of this project were further revised upwards (when the present exercise was completed) by another 35 per cent which would double the cost per hectare of this project compared to the one in Kuttanad.

Notes

[I owe more than the usual word of thanks to I S Gulati for his guidance in finalising this study. A number of comments and suggestions that he offered for improvement and subsequent changes made at various stages of this study have made it a joint product. But he thought it fit to give me the privilege of the sole responsibility for the paper. Hence, I must add that I alone am responsible for any errors and omissions that may remain.]

1 A similar programme of land development taken up in 1974 was the Kuttanad Development Project covering an area of 52,000 hectares. Kuttanad region is also a low-lying area, 0.5 to 2.0 metres below mean sea level where an additional crop will be raised once the construction of bunds is completed. For an evaluation see, K P Kannan, 'Kuttanad Development Project: An Economic Evaluation'. *Indian Journal of Agricultural Economics*, Vol XXX, Number 4, October-December, 1975.

2 See *Report of the Survey on Unemployment*, 1965, Bureau of Economics and Statistics, Trivandrum, and *National Sample Survey, 12th Round*, E[illegible] *Unemployment in Rural Areas*, Kerala, 1970.

3 As per the 1965 Survey, a person was treated as underemployed if he worked less than 42 hours in a week; such persons constituted 54.7 per cent of the employed. However, in our calculations, we have taken only those who are severely underemployed, i e, those who worked less than 28 hours in a week. They formed 29 per cent of the employed. In the NSS of 1970, a person was treated as underemployed if he worked less than or equal to 4 days in a week.

4 Item 13 represents the saving effected as a result of reduction in the annual cost (on unskilled labour currently being employed) on repairs to temporary bunds. Thus the net addition to employment on account of the project will be less to that extent. Therefore in working out the social benefit due to employment this saving in wage cost has been deducted.

[illegible]ions [illegible]tween Small-Scale and Large-Scale Industry

A Different View

T Thomas

This article seeks to analyse the factors underlying the policy of promoting small-scale sector and to expose some of the major limitations of this policy.

The author argues that indiscriminate promotion of small-scale industry, defined merely in terms of size of capital, need not result in increased employment or the most efficient use of scarce resources like capital and land.

Very important factors like consumer interest, market linkage, the efficient use of resources and the need for innovation necessitate the continued growth of large-scale industry.

The role of the small-scale sector has, therefore, to be seen as complementary to that of the large-scale one and not one of exclusive dominance in a widening range of activities.

I

Introduction

INDUSTRIALISATION in India, like in all other countries, started with small industries based on arts and crafts, e g, handlooms, metal work, leather processing, oil expelling, etc. It was very much after the Industrial Revolution in Europe that we began to have large-scale industry in sectors like textiles, engineering, steel, etc. Education of our countrymen in the technologies of large-scale industry and the development of the market in India for the products of such industry led to the establishment of large-scale industries. And today we can look back with pride on the great strides made by Indian industry, especially after Independence. This remarkable change is noticed by outsiders who come to India after a lapse of time or after visiting neighbouring countries. Such progress has been made possible due to the encouragement and nurturing of industrial activity in the chemical and engineering industries through government policies which protected these industries through tariff preferences, investment incentives and a host of other measures.

Today, we have another stage when some people hold the view that the panacea for our problems of employment and industrial development is the accelerated development of the small-scale sector. Since this philosophy and the implementation of policies based on it can have a profound influence on the whole process and pace of economic development in our country, and can also affect the fate of many large industrial organisations, it would be useful to analyse and understand the assumptions underlying the current philosophy so that its limitations would become more obvious.

II

Critical Analysis of Case for Small-Scale Industry

Let us look at the economic reasoning behind small-scale industry. First of all, there is the belief that small-scale industry will provide the best solution to the great problem of employment generation in our country. Secondly, it is argued that small-scale industry will make less demand on important resources like capital and land, which are scarce in our country. Thirdly, it is held that the spread of the small-scale sector will prevent the concentration of economic power in a section of society.

There might be other economic arguments, but these are the main ones We shall examine these in some detail to see how valid they are in actual practice, and then go into a more general analysis of some of the limitations of small-scale industry.

Employment Generation

No one would dispute the need to create employment for all those who are able to work in our country. Employment is not only an economic necessity but also a social necessity, because it is only when a man has an occupation and an income arising from it, that he can assume a fuller measure of human dignity and true independence. However, there is ample reason to doubt whether the current tendency to promote small-scale in place of large-scale is going to generate any significant addition to employment as compared to the size of our problem.

First of all when we talk of employment, we should look at direct as well as indirect employment. Very often, large-scale industry can generate considerable amount of indirect employment which is not taken into account and cannot be matched by small-scale industry. Let us take an example. The organised sector of the soap industry in India uses 160,000 tonnes of non-edible oils and produces 270,000 tonnes of an acceptable quality of soap which the consumer is willing to buy. In cultivating and, in many cases, in collecting these oilseeds, it is estimated that over 100,000 people find employment — that too in rural areas, among marginal farmers and tribals. If the small-scale sector were to produce the same quantity and quality of soap, because it does not have the technology or the capital, it will not be able to use this quantity of non-edible oils. It will need to use either imported tallow or palm oil, or indigenous edible oils which have to be replaced by imported edible oils. In either case, the employment and income will benefit another country.

Compared to this level of indirect employment, the direct employment in the soap industry is only 12,000 in large-scale and 38,000 in small-scale sector today. As against 270,000 tonnes of soap produced in large-scale sectors, the small-scale sector produces 560,000 tonnes of soap per annum. It has been estimated that even if all the soap made in large-scale were to be made in small-scale, the additional employment will be only 18,000 persons which is far fewer than the difference in indirect employment of 100,000 persons.

Another major avenue of indirect employment related to large-scale is in the distribution system. In one soap company's operations, whilst it employs about 10,000 people directly, the indirect employment in the distribution system is over 30,000 people. In any meaningful comparison of employment in the two sectors, this also has to be taken

into account.

Again, employment has also to be related to income generation. In many industries an important reason for the competitive survival of small-scale industry in spite of all subsidies given to them, is the low wages in comparison to large-scale. For earning the same amount of wages in small-scale sector, in many cases at least double the number of people have to work. Therefore, the total wages paid to workers need not necessarily be higher and the income-generating capacity per worker is much lower in small-scale. This factor also has to be taken into account for any meaningful comparison.

Yet another dimension is the quality of employment. Today in India we have 5 million educated unemployed and their numbers are swelling. It is only large-scale industry that can provide the quality of employment that the better qualified people will desire. Therefore, growth of the large-scale sector is essential to keep pace with their aspirations.

There is a distinct and positive relationship between the growth of small-scale and large-scale sectors. Small-scale sector can be divided into three categories with regard to their relationship with large-scale sector. Firstly, there is a category of small-scale industries which depend for their growth on the growth of large-scale sector, e g, suppliers to large-scale manufacturers, small units servicing or finishing products of large industry, etc. The second category consists of those small-scale units which are independent of large-scale units with regard to their market, e g, handicrafts. The third category is where the large units and small units compete for the same market, e g, handlooms, khadi anl village industries, etc

An analysis of data provided in the Census of Small-scale Industry Units, published by the Development Commissioner for Small-scale Industry, shows that almost 60 per cent of small units (in terms of value of production as well as in numbers) fall into the first category, *viz*, dependent on large-scale units. The second category depends for its growth very much on the rate of growth in incomes domestically or on export market. The third category is often at a distinct disadvantage in competition with large-scale, due to price and quality as seen by the consumer.[1]

Therefore, one can conclude that a major portion (60 per cent) of small-scale industry will continue to depend for its growth on the growth of the large-scale sector. It is also to be noted that the more modern sectors of small sector are usually more dependent on large-scale industry in a complementary fashion. Therefore, in the ultimate analysis, any significant increase in employment in small sector has to be as a result of a corresponding increase in the activities of the large-scale sector as well.

But it will be somewhat myopic for us to depend on industry, whether large or small, to solve our employment problem in the present generation. And it has to be solved in the present generation if we want to avoid a social catastrophe. India is at a very critically dangerous stage of socio-economic development. On the one hand, literacy and awareness are increasing at a rate that will lead to ever increasing aspirations and cascading discontent. On the other hand, the rate of progress in communication and education, especially among females in the Hindi speaking belt, has been so tardy that population increase and all its attendant problems will not be checked, probably for another 25 years. Therefore, we have to contain and manage the social problems of an increasing population with rising aspirations and awareness till the populous backward areas of the country catch up with the modern sectors of the country. And providing employment for the masses in the rural area is going to be one of the key determinants for our ability to manage this imbalance. Industry — large, small or tiny — is not going to provide the major answer to this problem in a democratic set-up.

We have to look elsewhere, namely, to agriculture for the real solution. In India, we have 170 million hectares of cultivated land of which about 40 million hectares are under irrigation. First of all we can increase the 40 million hectares to at least 80 million hectares in the next 15 years, which is only a 5 per cent per annum increase in irrigated area. Secondly, and more importantly, in the irrigated area we should intensify agriculture by taking multiple crops. At present we use about 90 men per 100 hectares of cultivated land. The corresponding figures for Egypt and Japan (who are both more efficient than us in agricultural output per hectare) are 181 and 219 men respectively per 100 hectares.

It is evident that if we were to reach at least the Egyptian level of intensity and even if we did it for the 40 million hectares of the currently irrigated land, the *additional* employment generated in agriculture would be 36 million jobs at the rate of additional 90 men per 100 hectares. If we brought another 40 million hectares under irrigation, a further significant addition to employment would be possible.

This should be our real solution to the employment problem because it has the following advantages

(i) Employment will be generated where people live and there is no need to provide all the infrastructure required if they are displaced into urban areas.

(ii) Agriculture will become so much more remunerative per hectare of land that rural incomes will increase significantly. This in turn will accelerate progress, limit rural family sizes and make it possible to tax agriculture so that more resources become available for developmental investment, including investment in different sectors of industry.

(iii) With rise in agricultural income, there will be greater demand for products of industry — both large and small.

(iv) Surplus agricultural produce can be exported to neighbouring countries, in the Middle East, in order to earn valuable foreign exchange.

Economic history shows that all large countries had to go through this process of generating resources in agriculture, diverting part of it for industrialisation and thereafter transferring part of the population to industries and services that cater to the increased overall wealth. Whatever 'ism' a country may practise, this will be the inexorable process which even the Chinese have had to rediscover very recently. Let us hope, at the end of a lot of political rhetoric and debate, we will also reach this inevitable conclusion — preferably under a democratic form of government.

To sum up this point, small-scale industry by itself does not hold the solution to our employment problem. It has to be accompanied by growth in large-scale sector. And the real thrust lies in agriculture. Therefore, we should give far greater preference to setting up District Agricultural Centres in addition to District Industrial Centres.

Economic Utilisation of Scarce Resources

The most scarce resources in India are capital and arable land, in that order. If we have capital we can convert more of the land mass into arable and irrigated land. But there is a physical limitation to the extent of land and therefore it has to be treated as

scarce. Let us examine as to how small-scale industry relates to these resources.

Capital: With regard to capital, the common assumption that small-scale uses less capital has to be questioned. First of all, in almost all types of industries, which small-scale sector is engaged in, a major portion of capital is invested as working capital. An analysis of the finances of 326 small-scale units in Delhi had shown tdat 57 per cent of the total capital employed by these units was employed as working capital.[7] Another study covering 159 units[8] also indicated that 53 per cent of capital employed in small units was in working capital.

In the utilisation of working capital, smallness of operations is a distinct disadvantage unless the sources of material or the channel of distribution are artificially created through government subsidy. Larger scale enables an enterprise to utilise less working capital per unit of output.

Even in the area of fixed capital, it is not always to be assumed that small-scale units will use less capital if all the investments in the usually subsidised infrastructure are also taken into account.

Perhaps, a more important factor which is often lost sight of is the function of capital. A major function of capital is to generate capital for investment — not merely to produce goods for consumption. Large-scale industry utilises capital more effectively for generation of savings. This is because of the following reasons

(i) Large-scale industry which can use better technology is able to utilise raw materials efficiently and to recover by-products more fully. Therefore, they can produce more out of the same raw material, thereby contributing to increased resources.

(ii) Large-scale industry will tend to generate a larger proportion of non-wage income (e g, profit) than small-scale. It is the non-wage portion which will be saved for investment.

Let me give an example of how capital is diverted away from savings through subsidising employment. It concerns khadi and handloom industry. The NCAER has estimated the following costs of production of cotton dhoties by the three different sectors of textile industry :

Sector	Cost in Rs Per Metre of 20/24 Dhoti
Khadi	3.5
Handloom	2.9
Powerloom	1.8
Mills	1.6

Of course, these prices are totally distorted in the price to the consumer (as distinct from cost) due to heavy subsidies. But who pays for the subsidy? In the end, all subsidies are paid for by the consumer because a major portion of government revenue comes from excise duties which (unlike direct taxes) are paid by all consumers, irrespective of incomes. In fact, the poorer sections of society pay a much higher proportion of their income as excise on all kinds of essential articles. So can we justify subsidising employment in the less efficient sectors of the economy by taxing the common people?

Economic development does not depend merely on utilisation of an available resource like capital, but on a rapid increase in such resources, especially capital. And large-scale sector is better equipped to create such increase in resources.

Land: In the case of agro-based industries which constitute a substantial part of industry in our country (textiles, sugar, oilseeds, etc), the efficiency of usage of raw material has a direct bearing on not only the efficient use of land, but also on the income and expenditure of the farmers and rural population. For example, take the sugar industry where sugar-cane crushed and processed in mills yields crystalline sugar equal to 9.5/10 per cent of the weight of cane. As against this, in the khandsari and gur manufacturing processes in small-scale sector, the yield is only 6.5 per cent of crystal sugar equivalent. At present, 58 per cent of sugar-cane grows in India is processed into gur and khandsari while 30 per cent is processed in mills with the remaining 12 per cent being used for seed and direct consumption. Out of 143 million tonnes of cane, only 43 million tonnes are processed in mills. If this 43 million tonnes of cane were also to be processed in small-scale, we would lose 1.4 million tonnes of available sugar. If this 1.4 million tonnes of sugar were to be compensated as khandsari by additional agricultural production, we will need to produce about 21.5 million tonnes more of sugar-cane, that is an increase of 15 per cent (over 143 million tonnes) both in production and in acreage under sugar-cane.

In addition to the 15 per cent more land, we will also have to provide scarce water resources to grow this additional cane. Furthermore, as khandsari process gives much less molasses, there will be substantially less molasses and hence alcohol production. Thus, it is very clear that processing sugar-cane in mills will result in much better utilisation of land and water. Yet, in our country, mill sugar is charged almost 100 per cent more excise than khandsari while gur pays no excise. If we are to shed emotional inhibitions and take into account the total economy in terms of land usage and consumer interests, this policy should be reversed in favour of mill sugar.

Let us take another example from agro-based industries — this time of a commodity which is perennially short in our country, *viz*, oilseeds. Vegetable oil can be derived from oilseeds using either a ghannie or expeller, or a solvent extraction plant. Taking groundnut seed which contains about 40 per cent oil, crushing in a ghannie will result in leaving about 10 per cent of the weight of cake (that is 15 per cent of oil available) as oil in cake. In an expeller, the corresponding figures will be 6 per cent (and 9 per cent of available oil) and in solvent extraction it will be less than 1 per cent (or 1.5 per cent of available oil). Therefore, there is a wastage of about one-seventh of the available oil in ghannie, and about a tenth of available oil in the case of expeller. This kind of wastage affects not only the area required to be under cultivation of oilseeds, but also makes the oil dearer for the consumer.

Therefore, it is evident that in the efficient utilisation of land, large-scale industry has a more positive role than small-scale industry.

Disposition of Economic Power

The third argument used in promoting small-scale as well as public sector, in preference to large-scale, is that of preventing the concentration of economic power in private hands.

Let us examine the real consequence of this policy. On the one hand, we have the spectacle of our population becoming increasingly the victims of the less efficient public sector monopolies. All basic industries like coal, power generation, steel and petroleum are in the public sector. What is the difference we find between a private sector monopoly and a public sector monopoly? First of all, the private sector monopoly is usually more efficient as it has a profit motive which entails sanctions that make the management efficient. Public sector companies have no such compelling motivation. Secondly, the private sector monopoly is afraid of the MRTP Act, whereas public sector is exempt. Thirdly, when public sector enters an industry, it will have to try its best to convert itself into a monopoly so that competi-

tion need not be faced. So, as consumers, we are at a disadvantage dealing with public sector monopolies.

Yet economic power is shifting into the public sector and therefore into hands of politicians and bureaucrats who wield disproportionate power over vital sectors of industry. We have to stop and ask ourselves, "Have we really prevented concentration of power?" We have not. We have only shifted the source of power.

At the other end of the spectrum, we are told that promotion of small-scale industry will prevent concentration of power. In actual practice, it does the opposite. A small-scale man is at the mercy of government authorities at considerably more layers than the large-scale man. Whether it is for finance or for space, or for raw materials, or for various subsidies to offset inherent disadvantages, the small-scale man has to please many masters in the state governments, the banks, the municipalities and all the multifarious agencies of the Central government. The holding power of a small-scale man is very limited and bureaucracy knows that and exploits it to the full. For instance, there is the case of a small-scale industrialist who had to get his small boiler certified by an inspector who expected his usual 'dakshina'. When the man hesitated the inspector was good enough to work out for him the loss the former would sustain per day and the fact that his 'dakshina' was hardly equal to a week's loss. He will hesitate to do it with a bigger industry because he is never too sure of the degree of helplessness of big industrialists, due to their linkages, real or assumed, at higher levels.

In view of these facts and trends, one would question the assumption that small-scale dilutes the concentration of economic power. In fact, it merely transfers the concentration of economic power to the government.

Having thus examined the arguments in favour of small-scale, let us discuss some of the serious limitations of this sector.

III

Limitations of Small-Scale Industry

One of the blind spots with many advocates of small-scale is with regard to the market. They tend to think of industry almost exclusively in terms of the production unit. The most acute form of this myopia is among those who think every village or group of villages should produce all that they require and become thereby self-sufficient. But that will be the self-sufficiency of the type that was and is still being enjoyed by our tribals and adivasis. Fortunately, we live in a society which is democratic with open channels of communication and an increasing degree of awareness and freedom of choice for consumers. If a villager in a remote part of UP goes to a cinema or listens to the radio, he may hear about the virtues of dental care or the benefits of family planning. He may see actors and actresses in fashionable attire. You cannot then expect him to have no desire to acquire some of the products he has seen or heard of. He is not going to be satisfied with the neem twig or rice husk charcoal for cleaning the teeth. He is not going to be satisfied with the local fabrics or local soaps. He will want better products.

Therefore, the one inconvenient fact that everyone has to realise is that as communications inevitably improve in a democratic society, the size of the market and the mobility of products increase in ever widening circles. Of course, this will not happen in a dictatorial society where the needs and desires of the population can be controlled and directed. Fortunately, we are not in that situation.

Once we accept the existence of a widening market, a serious limitation of small-scale industry becomes abvious. Much larger resources than what the small-scale can command are required in order to sense the changing needs of the consumer, to create products to satisfy such needs, to test such products in the market place, to communicate to the consumer the characteristics of the product and to make available adequate quantities of the product at a uniformly acceptable and reliable quality, over wider areas. It is essentially growth of the market which leads to the growth in size of an industry and not the other way round. And no amount of rhetoric by politicians and academicians can change this fact. The fact is that in a free society, there is going to be an inevitable case for the size of the enterprise to grow with the size of the market.

To produce goods at optimum cost and quality, a continuous process of innovation is necessary. Innovation in industry consists of various measures to improve the productivity of the resources employed. This involves the utilisation of skills such as design engineering, industrial engineering, R and D, etc. To acquire and to support such skills, the industrial unit has to achieve a certain size which is beyond our country's definition of small-scale sector. Barring exceptions it is only large-scale industry which can devote resources for this, and then allow the innovative process to diffuse through to the small-scale sector. If all industrial units were to be exclusively in the small-scale sector we will have to look for innovations from large-scale industry in other countries. Or we may stagnate.

A serious limitation of the small-scale sector in several industries is the extent to which they have to depend on government subsidies and protection. This is given in the form of more liberal imports, concessional provision of finance, infrastructure and materials, preferential excise and other levies, preferential pricing in government purchases, exemption from several obligations to employees, and exemption from most of the control procedures.

Yet all these concessions and protections have to be paid for by society and to that extent small-scale is parasitical on the rest of society. If the subsidies and protection are withdrawn, they would wither.

To hold that only small is beautiful, is to be oblivious to the fact that everything that is alive has to grow. Today's small-scale industry is going to be the medium scale industry of the next decade and, hopefully, the large-scale industry of the following decade. It is not an accident that medium scale industrialists are now already getting worried. An enterprise has to keep growing, or else it will decline and die. Once we accept this logic of inevitable growth, the dividing line between yesterday's small and tomorrow's large becomes very fuzzy indeed. And those who try to hold the so-called line at small-scale sector are those who live in yesterdays.

Due to their lack of technology and limited access to markets, many small-scale units are able to compete with large-scale units, even after receiving subsidies, only by paying lower wages to their workers. In many engineering industries where labour costs are a significant part of costs, this is the case. Therefore, small-scale industry has the limitation of exploiting labour. This is also a cause of their failure because as the small-scale unit becomes profitable, labour will demand better terms and if those terms approximate the terms offered by large-scale, it can lead to ruin of the small-scale unit. Therefore, wage exploitation is almost an inbuilt

...survival strategy for small-scale industry.

In a similar fashion, the consumer is exploited by the spread of small-scale sector. He is paying for the subsidies and getting products of variable quality with lesser prospects of innovative improvements.

IV

Reconciling the Roles of Small and Large-Scale

Having thus understood many of the limitations of the small-scale industry, let us examine whether there is a way of reconciling the roles of large-scale and small-scale sectors, not in a mutually exclusive manner but in a complementary manner This was best stated by Prime Minister Morarji Desai, who in a recent communication to the Chambers of Commerce said

> In the context of our economic policy and industrial policy resolutions I have been considering the possibility of de-compartmentalising the present approach to village industries, small-scale industries and large-scale industries. While the priorities as between the three sectors of the overall industrial organisation of the country would undoubtedly remain unaffected, the question is whether from the functional point of view some amount of co-operation cannot be achieved .
>
> I have also been considering the matter in the larger context of promoting mutual co-operation, trust and confidence between the different sectors of industry
>
> From all these points of view, I am wondering whether it would not be possible to bring these three sectors of industry in closer co-operation through mutual assistance
>
> The common interests of the three sectors make this kind of co-operation a worthwhile proposition In fact this approach may generate competitiveness without the drawback of rivalry and a mutuality of interests may enable the three sectors to consider the problems of production and availability in an integrated manner

We must find ways of enabling complementary growth of large and small — not conflicts and compartmentalisation For instance, in many industries it should be possible to undertake the capital and technology intensive parts of the process in large-scale, leaving the labour intensive part of the decentralised small-scale, but again the marketing of the products being done by large-scale. An example would be that of textiles. Preparation of cotton and spinning is best done by large-scale. Weaving can be decentralised. But again, the finishing, quality control and marketing can be done advantageously by large-scale.

Or in the soap industry, we have shown that the processing of unconventional oils and the recovery of glycerine are best done in large-scale which has the technology and capital; the conversion of base soap material to tablets and packaging can be done in small-scale, with the marketing and distribution being done again by large-scale Our actual experience shows that this can work in practice with great advantage to small-scale producers

I am sure this approach of complementariness can be adopted by many industries In my view, the real development of small-scale industry in our country will take place only on the basis of such complementary growth, not on the basis of conflict

V

Conclusion

The factors underlying the policy of promoting small-scale sector have been analysed Some of the major limitations of the present policy, which states that whatever can be produced in small-scale must be produced by that sector alone, have been exposed. It has been shown that indiscriminate promotion of small-scale industry, defined merely in terms of size of capital, need not result in increased employment or the most efficient use of scarce resources like capital and land Very important factors like consumer interest, market linkage, the efficient use of resources and the need for innovation, necessitate the continued growth of large-scale industry. Therefore, the role of the small-scale sector has to be seen as a complementary to that of the large-scale one and not one of exclusive dominance in a widening range of activities..

[illegible]eory and Practice

Ajit K Biswas

The activities of the Institutes of Management, ostensibly considered research, are mostly based on wrong mercenary values, are totally inappropriate in the objective situation of our country and militate against the development of any serious research programme except by isolated scholars.

I

Management Institutes Galore

THE mushrooming of management institutes all over the country during the last decade or so is a clear indication of the scope for manipulation that has emerged in this field.* It is going to strengthen some of the tendencies which are noticeable in the Indian Institutes of Management set up under government auspices and to tarnish their image as academic institutions. These Institutes were intended to initiate training and research in such problem areas as are not covered in universities (concerned with the basic disciplines of science and humanities) or in the various Institutes of Technology. But they were to be considered as institutions squarely based on genuine academic values as proclaimed in the relevant documents. The alienation of these Institutes from academic values is already widely pervasive, and transparent even to the intelligent layman, let alone the cognoscente.

Flashing advertisements about management development programmes (MDP), extension programmes, in-company training and consultancy activities of these Institutes provide ample opportunities for racketeering. The target groups are often a curious assortment of persons with different educational and experiential background. Over a long time span since the inception of these Institutes, the target groups consisted of manufacturing concerns in the private sector which used to send delegates from the middle or lower rank of executives. Now a lot of canvassing is required on the part of the interested faculty to attract the minimum number of participants to enable them to run the programmes without any loss.

There is, of course, an increasing demand now for programmes from public sector enterprises and government organisations for various types of national schemes requiring the training of personnel in different types of activities. But it does not change the basic character of the Institutes in respect of training and research so long as the researchers and instructors do not care to equip themselves properly for these programmes. The lapse is more on the part of the faculty than on the part of the participants. The programmes often suffer from the lack of necessary knowledge of the instructors in respect of the problem area, especially in the Indian context. More often than not, the participants are more interested in sheer animal comforts provided in the luxurious hotels where these programmes are conducted. The quest for knowledge is the most conspicuous by its absence. The mercenary motive is found by the faculty to be more rewarding in their scale of values, as most of the target groups neither care to be exacting enough, nor do they have the necessary background to assess critically the fare they are served.

The differentiation of the role of management institutes from that of universities is often exaggerated. It is said that the management institutes are unlike universities which are after knowledge, rather than the fruits of knowledge — as if the two are easily separable. Bridging the gap between theory and practice or so-called *functional* areas does not lie in the realm of charlatanry but with scientists who can appreciate the interdisciplinary nature of any real life problem requiring policy decisions.

II

Management Institutes and Generation of Funds

We are told that one of the specific features of management institutes is generation of funds through consultancy, MDP's and extension programmes, unlike other academic bodies such as universities. The rating of a faculty member by his capacity for generation of funds is readily acceptable in our socio-economic structure. The more one degenerates as a scientist, the more one's capacity for fund generation. That is why the management institutes provide berths for con men who will find themselves extremely uncomfortable in the company of genuine intellectuals of both theoretical and policy orientation.

It will not be far from the truth to assert that the Institutes of Management do not have any clear sense of priority in their areas of research, developing from the intellectual urge of the concerned faculty. Ideally the rationale of this urge must be consistent with the objective conditions operating in the country and which provide the ideological base. The logic of development then arises from questions and problems emanating from ongoing research in the various areas and not from the demands foisted on them by interested target groups, national or international. These target groups, even with their very limited objectives, retain their control since they provide the necessary financial support. I wonder how many of our management consultants from the Institutes would dare to probe deep into the financial structure of the big business houses which will involve a thorough scrutiny of their many underhand deals, violation of laws, propensity for speculation, etc. What is essentially a system of patronage is considered to be the return for imparting knowledge. Most of the reports produced by these consultants have no substantive research content.

What is extremely disturbing in these Institutes is thus the appearance of intellectual mercenaries on the scene. The so-called progressive ones have found in this confusing situation an opportunity to expand their area of operation and to cover problems of national and social importance, the demand for which arises from various government organisations and, maybe, the genuine needs of the country. They publicise MDPs and extension programmes in respect of subjects like energy and power, transport, health, water resources,* urban development, nutrition, small-scale industries, etc. The Institute which provides the maximum number of

* This paper is not concerned with some of the finest scholars employed in the Indian Institutes of Management. It refers to the dominant trend, to some extent built into the system, which has developed over the years vitiating the basic academic values.

* I attended one of the finest seminars on this area in the Indian Institute of Management, Calcutta, with great care being taken in the choice of participants and faculty. But these are exceptional in nature. I am concerned with the dominant trend.

such programmes is, so to say, on the map. Preparatory work by the interested faculty is minimal in these cases and they are prone to borrow heavily from whatever is available in the literature of the Western countries irrespective of any sense of relevance. They hardly appreciate that in most of these areas, very little or only the most perfunctory and scattered work has been done in the Indian context. The basic technical literature is out of bounds for quite a large number of the faculty in respect of their intellectual equipment and absorptive capacity. A proper perspective requires the organisation of sustained and intensive research in most of these areas rather than overnight preparations for very short duration courses, pending any pedantic posture as purveyors of knowledge. Essentially what we find in these programmes is the same type of persons, whether they come from the various organisations of the government, private or the public sector or the Institutes of Management, arbitrarily split up between researchers and teachers on the one hand, and student participants on the other, depending on their respective stations in life. Nothing serves the Institutes better than grabbing funds from whatever sources they may come, since this is an ideal game where the generation of funds and research are happily combined!

III

Management Science and Basic Disciplines

Any management problem except trivial ones derives its sustenance from and must have its roots in the basic disciplines which have developed over a long period of time and is a part of our cultural heritage. Failure to appreciate this lands an aspiring management scientist in a quagmire where management becomes a commodity to be bought and sold in the market like other commodities. The political economy of India — its base and superstructure — provides ample scope for this confused irrational role of management institutes. The professed objectives of socialism present only a camouflage for a game in which the big business houses and oligopolists, bureaucracy and mercenaries posing as intellectuals share the common interest of filling in their respective coffers. The public sector is only a thin wedge which suits them pretty well, for they are then in a position to claim that in the framework of a regulated economy, they are also subserving the interests of socialism!

Ignorance of and alienation from basic discipline result in *ad hocism* in the profession of management training and research. In the process, the vested interests of the target groups dominate and they can easily impose their own values on the management researchers. The faculty find any doubt regarding academic and social values they might have had in their early years extremely hazardous and uncomfortable. In an inflationary situation there cannot be any value which serves them better than financial affluence. In consequence, the dominant trend in these Institutes of Management is primarily the degeneration of potential intellectuals and the erosion of academic values through a progressive loss of serious-minded scholars. Whether to quit in grace or flourish in disgrace, of course, presents a hard choice for the young aspirant.

The basic disciplines are bypassed by

rious subterfuges which are readily ,ailable in a large number of manage- ,ent text books. To give an example, ,cial cost-benefit analysis of manage- ent education can be shown in the ,rm of a calculus of the difference tween the money earning potential of e graduates and the cost incurred on em, with all the paraphernalia of dis- ,unting, etc. Jargon mongering and orking in cook book recipe styles ,are the management man from the duous task of the search for know- dge. It suffices to know the terms ,ed in scientific publications and voke them, as and when necessary, cording to his conception and in a anner which serves the interests of target groups and the concerned culty. It is uncomfortable for this pe of persons to find any scholar ganise a seminar on, say, stochastic ocesses, or classical political economy, r where ignorance is bliss and begets oney, it is foolish to be wise. The zziness of values, to give another ample, is sharply brought out in the nventional marketing courses. The chnique of luring people through lvertisements and various other media adopt new brands, and in our country xury goods for the affluent are taught ith great fanfare; some shoddy stati- ical methods are used to give these urses a scientific garb. I wonder w many of the market researchers d instructors have been able to preciate the import of a thoroughly jovable book like Vance Packard's lidden Persuaders", let alone serious ciological literature.

IV

Theory of Management Research as a Science

It is necessary to appreciate, that in country like India, it is irrelevant and ational to give undue importance to search programmes which cater to e limited objectives of the private ctor. Despite the sizeable industrial- ation that has taken place in our untry, the problem of poverty has, cording to expert estimates, assumed a rious dimension. This is obviously not flected in the measure of per capita al income, since this concept is in- pendent of the notion of distribution. consequence, whatever development e have achieved is of a very lopsided ture and efforts have hardly been mmensurate with our needs. It is, erefore, imperative on the part of cial and natural scientists of both eoretical and applied orientation to address themselves to these problems which will help in the amelioration of the economic condition of the masses.

The task of the scientist, no doubt, is a limited one. Unless the decision-making authorities represented in the government are receptive to the expertise provided by them, and are ready to set up an effective machinery for the implementation of the agreed programmes, there will remain a frustrating gap between what is suggested by management science and what is actually practised. Unfortunately in the Indian situation where mixed modes of production operate and do not conform to any of the classical types experienced in the Western countries, there is bound to be a big gap between expert solutions and their implementation, between the professions and practice of the government. Fundamentally the economic base which determines dialectically the political superstructure will remain as the dominant force. Admittedly the experts cannot be held responsible for deliberate distortions and lapses in implementation of their programmes, but they cannot forfeit their responsibility to remain committed to their problem solving studies and continually strive to establish a persuasive rapport with the decision-making authorities.

No real life problem is solvable in terms of any basic discipline. That is why we require a dialogue among experts drawn from various fields of specialisation. Their interaction demands that the expert must be able and educate himself, if necessary, to understand the language of other experts. This will indeed enable the team to forge an effective participation in interdisciplinary research. I think this is possible and eminently desirable requiring mutual sharing of academic and social values, and understanding between faculty members belonging to different disciplines. Secondly, in any real life problem we have to take account of the historical situation, that is, an appreciation of the *present as history*. It is obviously fruitless to seek the solution of a problem in a vacuum or to suggest any policy prescription deemed to be applicable to all situations irrespective of time and space. Thus ahistoricity is inadmissible in most of the applied or management problems. This is particularly important in the Indian context since there is an inbuilt tendency in our educational system to lean heavily on Western experience. Thirdly, there must be a clear appreciation of the difference between the *explanatory* framework and the *prescriptive* framework of a problem. An explanatory or diagnostic framework will, however, have primacy in the sense that it is a prerequisite for the development of the prescriptive or the policy model.

This brings us right to the central theme of management research which implied the rational handling of a problem with a thrust on the formulation of appropriate policies. While one has to recognise the importance of objective historical situation and the technological constraints, it is not possible to frame any effective policy in any problem area if the constraints set by adverse institutional factors and socio-economic structure are regarded as absolutely sacrosanct and binding. In the transitional stage of an economy like ours, the situation appears to be often frustrating for the experts, but they cannot escape from their basic responsibility of hard work, and articulation of their views in a manner which is understandable to the larger section of the community. This, I believe, is the ultimate reward for their research, even if the powers that be are not attuned to the rationality of expertise because of the basic irrationality of the socio-economic structure.

It is not being suggested here that we should aim at the ideal or the first best solution. It is the failure to accept the second or third best solutions by the decision-making authorities that might be extremely demoralising for the management scientists. I am using the term failure either as outright non-acceptance or half-hearted acceptance resulting in distortions and lapse in implementation. The other type of failure which is inherent in the notion of science as an ever evolving body of knowledge is part of the educative process providing us with the techniques of learning by doing.

V

Conclusion

To conclude, I have no doubt in my mind that some of the activities in the Institutes of Management, ostensibly considered as research, are based on wrong mercenary values, totally inappropriate in the objective situation of our country, and they militate against the development of any serious research programme except by isolated scholars. The image of the Institutes is not determined by these lone scientists but by the dominant functional areas where charlatanry comes into its own.

Latin American Economy in 1978

THE Executive Secretary of Economic Commission for Latin America (CEPAL), Enrique V Iglesias, drew up a preliminary balance of the performance of the Latin American economy in 1978 at a press conference held at CEPAL headquarters at the end of December 1978. In general terms, the data available to CEPAL indicate that (a) there was a slight slowing down in the rate of growth (from 4.5 per cent in 1977 to 4.1 per cent in 1978) so that for the fourth year in succession the increase in the regional domestic product was relatively poor; (b) in the external sector, the deficit on the current account of the balance of payments rose substantially; (c) as a result of higher inflows of capital, Latin America's gross international reserves were further strengthened; (d) on average, over the region as a whole, the inflationary process slackened slightly in 1978. The assessment by the Executive Secretary of CEPAL is reproduced below from *notas sobre la economia y el desarrollo de america latina*, January 1979, prepared by CEPAL Information Service.

Economic Growth

The growth rate of Latin America was somewhat lower in 1978 than in the preceding two years. According to preliminary estimates, the region's gross domestic product grew by 4.1 per cent, which is lower than the 4.5 per cent and 4.4 per cent attained in 1977 and 1976, respectively (see Table 1).

The growth rates of Mexico and Colombia improved markedly, which was connected with the rise in petroleum production and the industrial upturn in Mexico, and the good results in agriculture and manufacturing production in Colombia. The Brazilian economy grew at a rate which was much the same as in the previous year, although its agricultural production declined as a result of widespread drought. A large group of countries also had product growth-rates which were similar to or somewhat lower than those of the previous year. On the other hand, in some countries economic activity declined, as in the case of Argentina, Nicaragua and Peru.

Over the last four years the Latin American economy, growing at an annual rate of roughly 4 per cent, has not managed to repeat its dynamic performance in the five-year period 1970-1974, when the region's domestic product grew at an average rate of a little over 7 per cent. Although the Latin American countries are currently better able to defend themselves against difficult international economic situations, the slow and erratic growth of the industrial centres since 1974 has unquestionably had an unfavourable effect on the region's development possibilities.

External Sector

A number of major features, some of them of an adverse nature, marked the evolution of the external sector for the Latin American countries as a group during 1978. The value of exports of goods rose by only 4 per cent and with a moderate but greater increase in imports (9 per cent) and a further increase in net payments of profits and interest, the deficit on current account was appreciably higher than in 1977. However, greater movements of capital led to a rise in the overall balance-of-payments surplus (see Table 2).

With regard to exports of goods, the growth in their value took place despite a drop in unit value (3 per cent) due to the growth of the volume exported, which amounted to 7 per cent.

What is immediately apparent from a separate analysis of the performance of the exports of the oil-exporting and non-oil-exporting countries is that in the former group (which now includes Mexico) the unit value and the volume of exports, remained stable. This is true of the average for the group as a whole, however, and it should be noted that Ecuador and Mexico greatly increased their volume of exports.

The non-oil-exporting countries was characterised by significant rises (of about 10 per cent) in the volume of exports, which offset the drops which took place in almost all of them in the unit values of exports. This confirms the increasing productive capacity and flexibility attained by the Latin American economy, as well as the favourable results being achieved by the export promotion policies of the countries of the region.

The fall in the average unit value of the exports of the non-oil-exporting countries (4 per cent) was the result of drops in the world prices of some basic commodities, including cotton, sugar, cocoa and coffee. On the other hand, the prices of goods such as beef, tin and wheat rose to varying extents.

With regard to imports of goods, the growth in their value was the result of a rise of 7 per cent in unit value and of only 2 per cent in volume. Whereas the variations in unit values were the same for all countries of the region, there were important differences from the standpoint of the volume of imports, particularly in the case of the non-oil-exporting countries.

Thus, on the one hand, the volume of imports dropped considerably in Argentina and Peru, which were connected with the course of economic policies followed in those countries. On the other hand, in a number of countries the volume of imports rose by over 10 per cent.

Due to the above-mentioned trends in export and import prices, for Latin America as a whole the terms of trade declined significantly (9 per cent). The countries most affected by the drop in the world prices of their main export products (Colombia, El Salvador, Honduras, Paraguay and the Dominican Republic) were naturally those where the terms of trade declined most.

These variations in exports and imports of goods, together with the net variation in non-factor services, caused the region's deficit on the trade balance to double, rising from 2,150 million dollars in 1977 to 4,400 million in 1978 (see Table 2). Nevertheless, it should be pointed out that this change was entirely due to envents in the oil-exporting countries, since the trade deficit of the non-oil-exporting countries remained the same.

Net payments of profits and interest by Latin America continued to rise, amounting to 9,700 million dollars in 1978. Thus the total deficit on current account rose from 10,600 million dollars in 1977 to 13,900 million in 1978. Contrary to what occurred in previous years, in 1978 more than half the deficit stemmed from the external accounts of the oil-exporting countries.

The net inflow of autonomous capital ammounted to 20,500 million dollars, an appreciably higher figure than in 1977. As a result, the region was able to finance its current account deficit and at the same time its balance of payments recorded an overall surplus of 6,600 million dollars. In the case of the non-oil-exporting countries, the surplus amounted to 7,600 million dollars, whereas the oil-exporting countries recorded a deficit of 1,000 million which corresponded primarily to the Venezuelan deficit.

In view of the performance of the balance of payments of the region, it is estimated that at the end of 1978 gross international reserves will amount to over 30,000 million dollars, against 26,600 million at the end of 1977. This additional build-up of reserves was concentrated in a few countries, particularly Argentina, Brazil and Chile.

Inflation

Inflation has become a necessary item in the annual studies of the performance of the Latin American eco-

nomies, not only because of the levels it attains but also because it affects a large number of countries.

On the basis of data which does not cover the entire year, and of preliminary estimates for many countries, it is estimated that inflation in the region dropped slightly in comparison with the previous year. The rise in prices for Latin America as a whole is estimated at roughly 40 per cent in 1978, compared with 42 per cent in the previous year (see Table 3).

While this is significantly lower than in 1975 and 1976 (60 and 64 per cent respectively), it is still almost double the figure for the period 1970-1973. From an overall standpoint, inflation continues to be a real problem in the region, and furthermore, an analysis of the causes of the rise in inflation in each country leads to the conclusion that inflation is a complicated phenomenon to interpret and therefore a tricky one to tackle.

Recent inflation has affected the region to varying degrees and in various ways, the countries are divided into three groups in Table 3 according to the overall features of the different inflationary processes. The inflationary picture in 1978 changed in a number of noteworthy ways.

In the first group, where inflation was high and stemmed primarily from domestic causes, the performance was not uniform. Whereas the inflationary process picked up to some extent in Argentina, it dropped considerably in Chile and Uruguay. All in all, the average for the group was similar to that of the previous year.

In the second group, with intermediate levels of inflation due to both external and internal factors, a number of differences occurred. Whereas the rate of inflation dropped in Brazil, Colombia and Mexico, it rose appreciably in Peru. One of the causes of the drop in the rate of inflation was the lower growth rate of imported inflation. Inflation in Peru was affected by other factors, more closely linked with real and financial domestic disequilibria.

With regard to the group of countries with moderate inflation, there was a slight increase in the rate of price rises for the group as a whole, from a little over 8 per cent in 1977 to almost 10 per cent in 1978. It should be stressed, however, that while inflationary trends were once again quite moderate in this large group, with the exception of Jamaica, they were not uniform in all of them. In half of the countries the rate of inflation increased to some degree, whereas in the other half it declined (see Table 3).

For most of the countries in this group, in 1978 imported inflation was weaker than in the previous year. The prices of imports rose by 7 per cent in 1978 for the group as a whole, as opposed to almost 9 per cent in the previous year. On the other hand, export prices dropped moderately, whereas they rose by over 15 per cent in the previous year. These changes and a study of events in each country suggest that where inflation increased, domestic factors have become more important, although the possibility cannot be ruled out that imported inflation has a lagged effect on domestic prices. Be that as it may, the rate of inflation in this group appears to have been kept under control.

This picture of inflation in Latin America in 1978 provides food for thought, bearing in mind that four-fifths of the population have been suffering the consequences of active and sometimes intense inflationary processes.

During this examination of the Latin American economy during this year which is coming to a close, one cannot hide one's concern at the phenomenon of inflation together with the already unfair distribution of income. When price rises become severe, it is the poorer sectors, and broadly speaking those with fixed wages, which bear the brunt of the effects; when stabilisation policies are applied, it is again those sectors which most suffer the effects of the discipline imposed on wages and salaries and public expenditure. All in all, both when developing and when recurring, in view of the policies usually followed, inflation undermines the welfare of the wage-earning sector and hits the poorer groups harder.

ECONOMIC INTEGRATION

Despite the difficulties being experienced in the formal integration processes being carried out under the existing multilateral agreement. (LAFTA, Andean Group, Central American Common Market and CARICOM), trade within the zone has continued to grow in absolute and in relative terms. Although at the beginning of the present decade exports outside the region from some countries grew more than exports to countries within the region, in recent years exports within Latin America as compared with total exports elsewhere have resumed their upward trend. In 1974 intra-regional trade made up less than 15 per cent of the region's total trade, it is estimated that this figure rose to about 17 per cent in 1977.

This increase in intra-regional trade has made it possible to partially offset lower demand for imports arising from lower levels of economic activity and protectionism in the industrial centres To this must be added an additional advantage: the structure of exports within the zone is markedly more advanced and desirable than the structure of exports destined for other regions, because of their higher degree of processing and technological complexity, and the support they provide for Latin American industrialisation.

Informal integration, which is being put into practice by means of specific arrangements between two or more countries, in parallel with the formal processes, has expanded substantially both in terms of magnitude and in terms of the variety of arrangements for trade or the implementation of joint projects. Nevertheless, such informal actions should be not an alternative, but a complement, to action through the existing multilateral institutionalised integration processes.

If such complementary steps are taken, it will be possible to give greater impetus to regional integration; in addition, it will be possible to achieve greater balance in the distribution of the benefits arising from integration, if the informal arrangements improve opportunities for development in the less industrialised countries of Latin America, and also if, in the formal processes, special instruments are used for such countries which help to offset their initial disadvantages *vis-a-vis* other, relatively more industrialised economies in the region.

Bearing in mind the poor prospects for the world economy and the growing protectionism in the developed countries, the major difficulties which Latin America has been encountering in exporting to other regions will probably be lasting rather than transitory. For this reason, the regional market is an important potential source of dynamism which Latin American countries can avail themselves of in the coming years in order to achieve a faster growth rate and more active transformation of their structure of production.

In this context, it should be remembered that the period laid down in the Caracas Protocol for the operation of LAFTA runs out in 1980. As a result, it is both opportune and advisable to examine now the possibility of a decision by the countries making up the Association to extend the transitional period laid down in the Protocol.

As a measure to complement the approval of this extension it might be desirable to sketch out guidelines and machinery designed to revitalise LAFTA's activities. One aspect which it would be useful to tackle is the problem deriving from the increasingly inadequate margins of preference which the member countries of the Association have granted one another in view of the progressive sharp reductions which some of them have been introducing in customs tariffs for all imports irrespective of their origin.

Poverty in Latin America

According to studies carried out by CEPAL, 40 per cent of Latin American households were living in conditions of poverty around the year 1970. In other words, 110 million people found it impossible to acquire the minimum of goods necessary to satisfy their basic needs. At the same time, 20 per cent of households were in a situation of indigence, to the extent that they could not afford to buy enough food to provide a minimum adequate diet.

The issue of poverty in the region is disturbing not only because of its extent, but also because of the insufficient speed with which it is being reduced.

During the 1960s and the early 1970s, the absolute number of people living in poverty remained constant, while as a proportion of the total population they declined from about 50 per cent to 40 per cent. Nevertheless, in recent years it is likely that the lower rate of economic growth in Latin America has led to a small increase in the number of poor households in the region.

Another cause for concern is the way the poor have shared in the distribution of the growth in Latin American income. Over the 10 years between the early 1960s and the early 1970s, the 40 per cent of the population which did not succeed in breaking out of poverty saw their share in the total income fall from about 10 per cent to 9 per cent. From another viewpoint, what happened was that about nine-tenths of the growth in income benefited those who had not been poor even a decade before, and moreover that six-tenths of the growth in income went to the richest 20 per cent of the population.

This unsatisfactory trend contrasts with the fact that the growth achieved in many countries of the region places them in a better position to tackle the phenomenon of poverty than 10 years ago. So much so that it has been calculated as an illustration that the income the poor need to reach a level which would enable them to overcome their poverty dropped during the period in question from 8 per cent to 4 per cent of the Latin American gross domestic product, as a result of the growth in total income.

Nevertheless, apart from the need for balanced assessment of these orders of magnitude, it is necessary to recognise the urgency of finding concrete machinery to permit a greater proportion of the benefits of growth to be channelled towards improving the productivity, working conditions and welfare of the poorest groups, since it is clear that the phenomenon of poverty in the region is increasingly determined by the absence of equity in the distribution of income and by the nature of the system of production in which the income is generated.

Ideology of Jayaprakash Narayan

Ghanshyam Shah

Towards Total Revolution (Four Volumes) by Jayaprakash Narayan; edited with an introduction by Brahmanand, Popular Prakashan, Bombay, 1978; pp cli + 1200, Rs 250.

JAYAPRAKASH NARAYAN (JP) is a moralist, revered by a sizeable cross-section of the common people and the elite. Naxalite youths as well as Swatantrites and Jana Sanghis seek his support and use his name whenever they find it convenient to do so. He also enjoys the support of religious leaders like Satya Sai Baba and rationalist professors of the Royist persuasion. He raised hopes of the Indian masses by leading the Bihar movement in the years 1974-75 to bring about what he chose to call 'total revolution'. But before the movement could result in something tangible or otherwise, the country experienced Emergency — an authoritarian regime.[1]

The post-Emergency period has been the most crucial one in JP's chequered political career. He found new grounds for hoping to continue 'total revolution'. He felt himself to be so close to the ruling party, for the first time since Independence that he said, "The Janata party is dear to me... I feel it to be a part of my being" (IV, 208). He campaigned for it in the 1977 elections. Under his leadership the Janata party MPs took an oath at Rajghat to observe austerity and to build the nation on the Gandhian model. His say carried weight in deciding who should be the Prime Minister of the country and the President of the party. His say was decisive in the selection of the Janata party candidates for the assembly elections in some of the states.

But JP's romance with the Janata party has not continued for long. He now feels that he is being ignored by the party and the government. He has begun disowning his nominees and some of his close associates. At the moment, he is perhaps the saddest man in the country, watching the scene with a feeling of helplessness. This is an irony of history. But it is not a unique case. History has witnessed such heroes earlier. The only solace of those who adore him is that he shares the same fate as did Mahatma Gandhi whom he follows.

Why has been JP ineffective and why is it that his idea of 'total revolution' has failed? Why are the results of the 'total revolution' quite the contrary to what were expected? These questions need to be discussed dispassionately, both by JP's followers and by his critics. At the moment, Sarvodayites are at crossroads. Vinoba has withdrawn himself from Sarvodaya activities and has retired into seclusion, whereas JP has confessed that gramdan and bhoodan have proved to be ineffectual in solving "a major social-economic problem" (IV, 191). All this shows that the time has come to pause and make a critical appraisal of the Sarvodaya theory and practice. This has to be done on the basis of its ideological premises and empirical evidence rather than by indulging in loose talk or ascribing the failure of the movement to the failure of this or that individual.

In this context, the publication of these volumes of JP's writings and speeches editd by Brahmanand is welcome. The editor of these volumes was JP's one time secretary. At the outset, it should be mentioned that the volumes do not present all that JP has written and spoken. What is presented in these volumes is Brahmanand's selection. It should be said that on the whole, the selection is judicious, and there is nothing much to complain about it.

JP obtained a degree in Sociology from the Wisconsin University, where he wrote his Master's thesis on "Cultural Variation" in 1924. He has also written more than forty books during the last four decades. Some of his books are: "Why Socialism?" (1940), "Social Responsibilities of Business" (1965), "Tasks of Social Research" (n'd), "Prison Diary" (1977). Yet he is essentially a man of action more than a theoretician. He himself says: "I never tried to write a book systematically and comprehensively, setting forth my thoughts" (I, vii). This is not mere modesty but an honest confession. One fails to come across any systematic account, let alone analysis, of any practical problems in his writings, though he has something to say on almost all problems faced by India.

Central Thread

But this does not mean that JP's writings are mere jottings of random thoughts and represent emotional responses to external events, though sometimes they do. One does find a central thread in JP's thinking. Even in his student days in America, he was preoccupied with cultural and moral values. That preoccupation remained with him later, when he became a leader of the Congress Socialist Party, the Praja Socialist Party and the Sarvodaya movement. His main concern has been "how to make India independent and help establish a social, economic and political democracy" (I, vii). To achieve that aim he began with following Marx and ended by following Gandhi. He found that Gandhi held answer to the problem of attaining his goal. He said, "Whether it is the political edifice raised on the foundation of Gramraj or the economic structure raised on small-scale industries and intermediate (or appropriate) technology, or whether it is the development of a rural-urban agro-industrial civilisation, the inspiration has to be drawn from Gandhiji, reinforced wih the most modern thinking and experience of the West" (I, vii).

JP has also continued to share Marx's vision of the future society, particularly a classless society without state apparatus. He earnestly desires to synthesise Marxism and Gandhism because according to him both have the same end, and differ only in the means they employ to achieve that end. He observes, "The values of individual and social life that socialism strives to achieve and make the basis of a new civilisation also constitute the foundation stone of a Gandhian society the values are not different [between the two]: social and economic equality [casteless and classless society], freedom from exploitation, fullest possible freedom and opportunity for self-development, dignity of the human personality; co-operation, society's responsibility for the well-being of each and the responsibility of each towards society" (I, 147).

Such ideas of achieving a sweeping synthesis of Marx and Gandhi are not only inaccurate, but also misleading. Indeed, it is mere wishful thinking. Gandhi did often talk about 'casteless and classless' society, as all statesmen, or Anand Margis or such others do. But it is necessary to have to look more closely at the teachings of Gandhi and Marx in order to see whether such an attempt at synthesis is worth making. Unlike Marx, Gandhi subscribed to caste society and the Hindu socio-religious framework. Gandhi categorically expressed, "I am a Hindu, not merely because I am born in Hindu fold, but I am one by conviction and choice. There is no superiority or inferiority in the Hinduism of my conception. But when Dr Ambedkar wants to fight varnashram itself, I cannot be in his camp because I believe varnashram to be an integral part of Hinduism".[3] Moreover, Gandhism and Marxism also differ, as JP himself has observed, in their "philosophical foundation". He says, "It is true that philosophically Gandhism has a non-secular and religious or supernatural foundation, whereas socialist philosophy is wholly secular and natural or material" (I, 147). How then can both of them have similar ends except in rhetoric?

Means and Ends

However JP himself feels that the most important difference between the two is that about ends. As against socialist, according to JP, the Gandhian believes in adherence to moral values and eschewing state power for attaining the end. "I for one have come to believe that for the achievement of socialism a strict regard for means is of highest importance We will never reach this goal [socialism] except by strict adherence to certain human values and standards of conduct" (I, 96). He has repeated this argument again and again: "Fair ends cannot be achieved through unfair and unscrupulous means" (II, 175). These 'fair' means and 'standards' of conduct include individual honesty and non-violence. On the other hand, JP alleges that communists follow any means to attain their ends. He found that "they have no honesty, no integrity. They are out-Geobbelsing Geobbels" (II, 115). They followed Machiavellism. JP's views are based on his experience with some of the Indian communists during the forties. JP however does not give examples of his experience which led him to arrive at this conclusion. It seems he has equated individual behaviour with the policies and strategies of the Communist party. The question involved is: do Marxist principles advocate that a Marxist must not have honesty and integrity and that he should be 'Machiavellian'? Or, is it that some Marxists are not honest? As far as individual instances are concerned, one can cite several experiences of 'Machiavellian' behaviour of the so-called Gandhians in pre-and-post-independence India. The adjective 'so-called' can be applied to all groups, be they Marxist, Jana Sanghi, free enterprise-wallah, etc. 'Machiavellian' tactics one adopts

for [illegible] with 'revolution or reform'. They must be condemned. For that, one need not be either a Gandhian or a Marxist.

However, it is simplistic to say that only 'moralists' adhere to moral values, and materialists in general, and Marxists in particular, do not abide by any moral values. The concept of morality the two entertain is different. To the moralists, certain moral values are 'universal' and 'eternal'. But there are differences among them as to which of the values are 'universal' and 'eternal'. Marxists on the other hand refuse to attribute absolute validity to any ethical principle or law. They do not accept suprahistorical morality, nor the categorical imperative, whether religious or secular. They are no *a priori* or eternal values that can be defined as moral values. According to them, men's ethical ideas are part of their social consciousness. Social consciousness often reflects one's position in society, certain social needs, real or imaginary, one's class interests and the requirements of authority.

In practice, neither moralists nor materialists nor Marxists stand steadfastly for certain moral values, come what may. In any actual situation, one has to take a stand. Therefore, one cannot take this or that stand in a vacuum. The stand taken depends upon one's own judgment of a situation. The judgment can vary, though one can rationalise the act performed retrospectively. Several examples in history can be cited in which moralists have taken decisions which negate the very values and principles they propounded. Gandhi, for instance, manipulated the Congress Committee in 1939 to oust Subhash Bose, the duly elected president of the Congress. Not only that, the followers of the Mahatma justified this act, and "created moral terror and shut the mouths of the opposition".[3] Recently, after the 1977 Lok Sabha elections, JP ignored the procedure of 'majority vote' in electing the Prime Minister of India. He imposed his decision on the party. His choice was, he declared, in the best interests of the country. He did not confess that his *modus operandi* was undemocratic though inevitable, in a given situation. One can cite similar examples in the case of the communists too. They also violated certain norms and procedures that they advocated at one time or another. Lenin and the Bolshevik party, for instance, pledged in 1917 to fight for world revolution and even to wage a revolutionary war against the [illegible] Germany. But early in 1918, at Brest Litovsk, Lenin came to terms with the Kaiser's government, and signed a 'shameful' peace treaty imposed upon the Bolshevik government by Germany. Yet Lenin did not feel that he had broken his pledge. He felt that by concluding that peace treaty he had secured a respite for the Russian revolution, and for the time being this was the only service he could render to world revolution. Lenin saw "nothing dishonourable in the behaviour of a revolutionary who retreats from his position before overwhelming enemy forces, provided that the revolutionary acknowledges the retreat as a retreat and does not misrepresent it as an advance".[4] This is the basic difference between a materialist and a moralist; the former accepts the retreat as a retreat, whereas the latter justifies the retreat on moral grounds.

Non Violence

As opposed to materialists, JP maintains that *Ahimsa*, i e, non-violence, is sacrosanct, and is the only means that can be adopted for achieving human progress. However I am not sure whether JP accepts Gandhi's concept of *himsa* which means not only to kill but also "hurt anyone — any life — by evil thought, by undue haste, by lying, by hatred, by wishing ill". However, according to JP, science can flourish only in a non-violent society (III, 82). How would he explain the development of science in the present day 'violent' society? Or, is there no development in science at all, and we have to wait for its development till a non-violent society comes into existence? He does not discuss such problems in detail.

JP's major concern has been with political violence. Here again, he confuses two forms of violence — individual terrorism with that of class struggle and mass insurrections. It is true that some impulsive and impatient self-styled revolutionaries, both so-called Marxists and non-Marxists, do give reason to JP for mixing up the two. They think individual terror is a substitute for mass organisation and class struggle. They forget that the capitalist or the feudal system is not managed by one, two or many ministers, or administrators. Individual terror, as Trotsky argued, "reduces the masses' importance in their own consciousness, because it reconciles them to powerlessness and orients their attention and hope towards a great avenger and liberator".[5] Individual terrorism results from a misconception as to the meaning of revolution. In this context, JP's stand against individual terrorism is relevant, as well as eminently reasonable.

Another aspect of political violence is 'class struggle'. It involves the recognition of the existence of classes and their conflicting interests. JP's position as regards the existence of classes in society is vague and vacillating. During his socialist days, he accepted the existence of different classes, in society. In 1948, he observed, "The Congress is not yet a capitalist party, but largely an agrarian party passing slowly under capitalist control" (II, 104). But later, after he embraced the Sarvodaya ideology, he never characterised any party in terms of its class character. In the absence of the category of class, his analysis boils down to personalities — Jawaharlal, Indira, Morarji, etc. However, again in the 1970s, he started talking about classes, though without any consistency. In 1975, rebutting Indira Gandhi, he asserted, "I wonder if she knows that a class war is going on all the time in Indian history, as in all societies where there are privileged and unprivileged classes. So nobody creates a class war. It is only a question of who wants which side of class war to win" (IV, 128). But in 1977, he was saying that in industrial society, "there was or there is an owning class who own the means of production and the other class which are more or less the tools of production.... Now in our society we do not have that kind of a classification" (IV, 204). Therefore, class struggle as 'the dynamics of social change' was out of question in India.

At the same time, there was a need for class organisations; "... the stronger sections should change their attitude... I found that it had little effect on the situation. I therefore, decided that I should advise the weaker sections to organise themselves and become strong enough not necessarily to fight against the stronger sections but certainly to claim their rights, enjoy the privileges which the law has given them in regard to the land reform, the housing and the similar other benefits bestowed upon them by law" (IV, 200-201). Please note here that JP differentiates between 'fight' and 'claim'. How does one 'claim' one's rights? Just by announcement? By forming an organisation? When one asserts his rights, can such assertion not involve fighting for one's right? But JP is allergic to the very idea of 'fight'. Further, he asks the poor to organise to claim what is given by law, thus confining their claim

within the legal framework. The question that arises is: what should the poor people do, if their claims are not accepted and implemented by the privileged class? And, what should they do, if the privileged class uses violence against those who claim their rights in an organised manner? JP's answer is significant. He forbids the poor to use violence even for self-defence. He observes: "The movement loses all validity as soon as the parties or the landless people indulge in violence. There might be violence from the side of the landlords or the administration. But the parties and the people concerned must face that violence with order and discipline. Nor can the right to use violence in self-defence be invoked in a satyagraha of this kind" (III, 130). One can imagine the consequences of such one-sided violence. JP is so concerned with the means (particularly to be followed by the poor people) that in practice, means become an end itself. If violence brings social justice, that justice is polluted, hence not acceptable to JP. Consequently, the main end of 'social justice' is sacrificed for the sake of the so-called 'purity' of means

In order to convince his followers that violence breeds only violence and nothing else, he selects facts and also shifts the level of analysis. His explanation of most of the events centres around the failure of individuals to conduct the Bhoodan Movement properly, the failure of the Congress, the failure of the Janata party, etc, and as soon as he confronts the problem of violence he passes over to the logical(?), abstract level. He argues that violence breeds violence and no sane society based upon justice, equality and democracy can be built up after a violent revolution. He argues, "... violent revolution destroys old order, but cannot build the new order ... This is never the structure of people's power [The failure of the Russian revolution] is not the betrayal of the leaders, but logic of violence" (I, 228). One fails to understand how, when masses take to violent means to combat the violence of the ruling class, the revolution ceases to be the expression of people's power? Such mass insurrections cannot be successful unless there is political consciousness of the masses which matches the consciousness of the ruling classes who take recourse to violence to preserve their rule and their privileges. Conversely, it may be asked: is there a guarantee that non-violent revolutions would build a non-violent, and also just, social order? According to the Gandhians, India won Independence (which they sometimes call revolution) through non-violent means. Has it led to the building of a non-violent society with justice, equality and so on? Our experience of the last three decades needs no documentation to prove that we are far from establishing the ideal 'Sarvodaya' or 'Socialist' society.

Parliamentary Democracy

Like the liberals, JP does not believe that parliamentary democracy can bring about socialism either. He argues, "Socialism, in Western Europe at any rate, has lost its pristine idealism and become only a parliamentary or legalistic creed" (I, 160). He has written and given speeches several times about the limitations of parliamentary democracy. But in this matter also he is not consistent. On the one hand he has shown the uselessness of the system, on the other he has entered into a long and inconclusive debate on the relationships between the executive and the judiciary, and between the executive and the legislature. He himself appointed more than one committee for suggesting electoral reforms. He spent a lot of time in giving suggestions on Lok Ayukt and Lok Pal Acts. After a brief retirement, he and Sarvodaya workers started taking active interest in active parliamentary politics — the formation of the Janata party, selection of candidates for state assemblies and parliamentary elections, campaigning for one or the other candidate, issuing appeals to the electorate and so on.

But as expected, JP has been disillusioned by the Janata party's performance within less than one year. He attributes the failure of the Janata party to some individuals and does not go beyond that. He blames Morarji Desai and Charan Singh for becoming "a part of the machine" (IV, 199). The question arises as to why Morarji Desai has failed? Is it because of his personal inability or dishonesty or is it because of certain forces which have continued to dominate the State? If Morarji Desai and Charan Singh have failed, who will succeed? Since Indira Gandhi is out of question (for JP) will Vajpayee or Advani, or JP, Kripalani or any other Sarvodaya leader (assuming that they would be prepared to shoulder the responsibility rather than remain advisers and critics) succeed?

The Sarvodaya leader knows the answer: They cannot. But he does not want to face reality squarely. His ethical principle of giving primacy to individual morality over material forces comes in his way. His vacillations are also due to his hesitation in accepting the existence of classes (no matter how one defines them) having opposed interests, and the dominance of certain classes over State power. During his Sarvodaya career, he entertained and advocated the pluralist view that the State was neutral, looking after the interests of all. Of late, he has begun to reject this view; "We were wrong in this assumption [that the State is neutral] and that the State system was subservient to a variety of forces with their interests entrenched in keeping it a closed shop is glaringly apparent now".[6] But JP does not pinpoint which these "variety of forces" are. What is to be done to free the State from the shackles of these "forces"? Have these "forces" disappeared after the Janata party's victory? Will they give up their hold over State power through a change of heart? Can the "State system" which he mentions above be changed by those same "forces" which have continued to remain in power?

JP and the Sarvodayites have to ponder over these questions dispassionately and have to "revisit" their moralist ideology. The Sarvodaya movement has now come full circle after three decades. Brahmanand's efforts at presenting JP's writings and speeches in a collected form will be aptly rewarded, if JP's "experiences and ideology" are discussed thoroughly within and outside the Sarvodaya circles. They seem to be more capable of doing that than many political groups.

Notes

Agrarian Relations and the Left Movement in Kerala

A Note on Recent Trends

N Krishnaji

The abolition of tenancy is widely believed to be accomplished fact in Kerala. The effective implementation of the law was possible largely due to the organised strength of the left movement in the state and the related fact that land reforms in Kerala were implemented by left-oriented governments.

The movement which has developed in Kerala since the abolition of tenancy has three main components: successful struggle for higher wages for agricultural labourers; espousal of the demand for 'fair' prices for farm products; and struggle for land.

This paper attempts to understand these recent trends in the left movement in the light of long-term changes that have taken place in agrarian relations.

TENANCY was abolished in Kerala through the Kerala Land Reforms Amendment Act (1969). In other states similar Acts, concerned more with the regulation of tenancy than its total abolition, passed during recent times, have meant their existence merely on statute books but in reality have led to diverse forms of concealed arrangements between landlords and tenants, usually enforced by the former to protect their own interests which were threatened by the law. In Kerala, however, the abolition of tenancy is widely believed to be an accomplished fact. Effective implementation of the law was possible largely due to the organised strength of the left movement and the related fact that land reforms were implemented by left-oriented governments, unlike in most other states where the reforms were sought to be introduced from 'above' before the peasant masses were politically organised to fight for their rights. An important aspect of the Kerala scene in this context is the conferment of ownership rights on hutment dwellers, which also was the outcome of intense political struggle and effective legislation. The movement which developed since the abolition of tenancy has three main components: a successful struggle for higher wages (for agricultural labourers); an espousal of the demand for 'fair' prices for farm products which does not require struggle (the peasant interest in this respect being sought to be protected by all political parties); and the struggle for land which has not been very successful.

This note is an attempt to understand these recent trends in the left movement in the light of long term changes that have taken place in agrarian relations. Section I deals with some aspects of the class structure and Section II with the strategies of the Communist Party of India (Marxist), the strongest representative of the Left, on agrarian issues.

I

Aspects of Changing Class Structure

Agricultural Labourers

The most striking feature of agrarian change in recent times in Kerala, as in other parts of the country, is the continuous growth of rural wage labour in its working population. A significant proportion of the labourers in rural Kerala are engaged, unlike in other regions of India, in sectors other than agriculture, especially in the primary processing of agricultural products such as coir spinning and manufactures. However, even within the agricultural sector, the ratio of cultivators to agricultural labourers has tended to decrease continuously at least from 1921. Trends in the composition of the working population show a fall in the proportion of cultivators and a rise in that of agricultural labourers.[1]

This is no doubt due, in part, to the dispossession of the poor and middle sections of the peasantry at different points of time in the history of the regions comprising Kerala. But to what precise extent it is associated with the development of capitalist agriculture is hard to judge on the basis of available data. In the most recent period, i e, after land reforms (the nature of which will be discussed below) have been implemented, two counteracting forces have been at work. On the one hand, rights to ownership of land have been conferred not only on the *kudikidappukar* (hutment dwellers) but also, as a result of tenancy legislation, on poor peasants, who used to cultivate landlords' land under various forms of tenancy arrangements. On the other, the poor peasants have not in general been able to raise the productivity of their lands and their living standards for obvious reasons. The question relating to the extent of proletarianisation resulting from the direct alienation of land from the poor peasants cannot thus be easily settled. We have data, however, which show that 'landlessness' among agricultural labourers has decreased during the period 1956 to 1971.[2] To understand the significance of the underlying statistics we need to consider the fact that hutment dwellers, who are now "owners" of land, usually put their little bits of lands to agricultural use (coconut and tapioca being the common crops) and hence qualify, for statistical purposes, as 'landed' agricultural labourers. This cannot, however, wholly explain the decline in landlessness for there is a distinct possibility of growth in numbers of poor peasants, cultivating bits of land but depending on wages, within agriculture and other sectors of the rural economy, for the major part of their subsistence needs. Indeed, there is quite convincing evidence that pau-

ion of the peasants has taken place on a wide scale and that the process has been continuous during this century. It is to this process that we now turn.

Growth in Numbers of Poor Peasants

It is well known that Kerala has the highest man-land ratio among the states of India and that it is one of most densely populated regions in the whole world. But what is perhaps not so well known is the fact that it has been so at least from the beginning of this century. The growth in arable land has not kept pace with the rapid increases in the population; consequently the man-land ratio has increased continuously from 1901 and at a rate more rapid than in other parts of the country.[5]

Data available for the Travancore region show that even as early as 1931 the average size of holding was only 2.6 acres per cultivating household, which declined further to less than 2 acres by 1966-67. With the persistence of gross inequalities in the distribution of land during this entire period, the proportion of households cultivating no more than an acre grew from 38 to 61 per cent.[4] For Kerala as a whole comparable data do not exist for such a long period; estimates available for 1961-62 and 1971-72 show, however, that household operational holdings of less than an acre in size increased from about 60 per cent of the total to 68 per cent during the intervening decade. The proportion of households cultivating less than half an acre in 1971-72 is estimated to be roughly 52 per cent.[5] These data reveal to us a source of growth of agricultural labour as well as an important aspect of its nature; a vast mass of pauperised peasants, not totally dispossessed of land, constitute a significant part of the labouring poor in agriculture.

How is the growth of small farms explained and what are its implications for the changing agrarian relations? To answer this question we need to consider, firstly, the magnitude of the transfer of land from the poor to the rich (which is relevant also to the question of dispossession); secondly, the impact of land reforms on the transfer of land from the rich to the poor (including the landless) through the distribution of surplus land (above legally stipulated ceilings) as well as conferment of ownership rights on small tenants following the abolition of tenancy; and finally, the partitioning of land among family members, which, even in the absence of vigorous market transactions in land, would result in the growth of small farmers over a long period. All these market and non-market forces are likely to have contributed to the growth of small farms. It is difficult to judge their relative importance to the process for want of the required data. What follows, therefore, is somewhat speculative but based on whatever information is available.

Land Reforms and Land Transfers

Data on transfer of ownership of land show that during the decade 1957-66 about 146 thousand acres were transferred through direct sale and that about 47 per cent of the area involved in these sales related to those induced by 'monetary needs'.[6] This may uncritically be interpreted to mean that dispossession of the poor and middle sections of the peasantry had taken place to a significant extent. This would indeed be so if it could be established that it was mainly the poor who sold the land to the rich. However, since the peak sales took place in 1960 and 1963, the years of "critical importance to the agrarian relations in the state" (to be explained later), there is good reason to believe that a great number of these transactions were made by the rich peasants and landlords to evade in advance the proposed ceiling and tenancy laws which were sure to be enacted by 'communist' ministries appearing on the horizon. Viewed in this light, the reason cited in the survey for the sales, *viz*, monetary needs must be regarded as spurious, at least in the majority of cases.[7]

To assess the overall impact of land reforms on the redistribution of land (and agrarian relations in general) we need to consider three aspects of the reform: provisions relating to (1) hutment dwellers, (2) tenancy, and (3) land ceilings. Kerala is frequently cited as an example where land reforms have been successfully implemented. The success refers more to the first two of the above mentioned aspects of the reform than to the third. At any rate, the effectiveness of land reforms in Kerala has been studied by many scholars and we need only to present the consensus in broad outline.[8]

Kerala Land Reforms Act, 1963 (as amended in 1969 and 1972) gave to *kudikidappukar* (hutment dwellers, who were essentially landless agricultural labourers living in huts on pieces of landlords' land) rights to their dwelling houses and a few cents of adjacent land. Most *kudikidappukar* have obtained *de facto* rights of ownership to such lands although in a number of cases *de jure* rights may still have to be secured. It is the strength of the leftist political forces, rather than the law, which has brought about this change in the status of agricultural labourers in the state. The rights to land, secured and protected by the left movement, in turn, strengthen the latter and give it a special character for a wage labourer with some land is a better fighter than one without any. We may conclude that, although quantitatively the gains to the agricultural labourers in terms of redistribution of land might not have been very impressive, qualitatively the left has emerged as a stronger force in the countryside, especially in the struggle for better working conditions for the labourers.

A series of legislative measures in the state culminated with the total abolition of tenancy in 1969 through an amendment to the Kerala Land Reforms Act of 1963. The resulting gains to the leftist forces are of a mixed nature. To an unknown but possibly limited extent, the law was made ineffective through evasive transfers (of possession) of land resorted to by the landlords. The latter anticipated what was coming and had time to make these transfers, for, in the political environment of the late fifties and sixties, in which the Communist Party was emerging as a strong force, the struggle for land was the most prominent aspect of politics in the state. When the first Communist ministry was formed in Kerala in 1957, "big landlords rightly apprehended that their feudal interests in land would be at stake. This fear paved the way for large-scale land transfers in the state even before the Agrarian Relations Act of 1960 was adumbrated". The last mentioned Act and the Kerala Land Reforms Act of 1963 prompted some hectic sales and transfers around those years. Over 40 per cent of the disposals of leased out land during the decade 1957-66 took place in 1963.[9] This need not, however, contradict our tentative assessment that the impact of evasive transfers on the effective abolition of tenancy was limited, for the total land involved in transfers of possession

over 61 [illegible] the amount was only about 188 thousand acres (out of a total of roughly 1.9 million acres of leased-in land).[10]

A second aspect of the abolition of tenancy relates to the compensation legally stipulated to be paid by the tenants. While such compensation has been collected in some cases by the government, there do exist former tenants who enjoy rights to land without fear of eviction although they have not yet paid compensation in full. This is a reflection, as in the case of *kudikidappukars*, of the organised strength of the peasants.

However, some former tenants cultivated fairly big holdings and have now acquired ownership rights to these lands. The reforms thus paved the way for the emergence of a new class of capitalist farmers especially in the northern region of the state, i e, Malabar, where not only the incidence of tenancy was high but also tenants cultivating (before the reform) land leased in from *jenmies* in big holdings existed in large numbers. In other regions of Kerala, i e, Travancore and Cochin, where the *jenmi* system disappeared long ago and small tenants were preponderant, the conferment of ownership rights on tenants is unlikely to have contributed to the emergence of capitalist farmers from the class of former tenants on the same scale as in Malabar. Apart from big tenants, new recruits to the class of capitalist farmers have come also from the ranks of the old landed gentry who now employ wage labour on lands (hitherto given out on lease) which they have 'resumed' for self cultivation.

A notable aspect of these changes, crucial to the developing agrarian relations, is the unity among landless agricultural workers, poor peasants and big tenants which the communists could bring about in the struggle against "land-lordism" in the Malabar region. New class divisions — and contradictions depending on them — emerging after the abolition of tenancy have weakened the objective forces for such a unity.[11] We shall deal with this subject later.

Let us now turn to the third aspect of land reforms, *viz*, ceilings. Unlike the provisions relating to hutment dwellers and tenancy abolition, those concerned with land ceilings have not yielded substantial gains to the Left. Evasion of land ceilings formed an essential part of the bogus transfers which we have already discussed. Moreover, in spite of many legislative exercises to 'plug the loopholes' in the law, sufficient scope was left for evasion through means other than direct transfer of land. The final result was that not much surplus land was available for redistribution. Statistics present a truly revealing picture of this phenomenon. As on March 31, 1978, the area (of surplus land above legally stipulated ceilings) ordered for surrender was only about 133 thousand acres, out of which about 67 thousand acres have been 'taken over' and only 39 thousand acres distributed (to about 62 thousand beneficiaries including 27 thousand belonging to the Scheduled Castes and Tribes). No precise estimates of how much of the 4.5 million acres of cultivated land would be available as surplus, should the ceiling law be implemented effectively, are available.

Partitioning of Land

Before we examine the implications of the changes discussed thus far to agrarian relations let us reconsider the phenomenon of the growth of small farms from a different point of view. Partitioning of land among members of a household creates newly formed households cultivating smaller pieces of lands, and in periods characterised by a high rate of partitioning, a very significant growth in small holdings can result. In Travancore, the decade preceding 1931 is important from this standpoint. During this period, following the passing of regulations for the partition of *tarawad* (i e, joint family) properties of certain communities, over 400 thousand acres of land owned by these communities alone were partitioned. In respect of the Nayar community (which accounted for 83 per cent of the land partitioned), over 70 per cent of the partition deeds created shares of less than an acre each.[13] A subdivision of this magnitude must have contributed significantly to the emergence of small peasants as the most numerous category in the countryside.

As we have seen, the disproportionately large growth of small farms has continued during recent times. Apart from the process of pauperisation, it is likely that the partitioning of land has also contributed to this trend. Moreover, the rates of partitioning appear to be higher in the small holdings than in the bigger holdings: this is partly reflected in data which show that as land size increases not only the family size but also the proportion of joint families tends to increase.[14]

Partitioning of land can thus be seen to have reinforced the trend towards the growth in numbers of poor peasants. At any rate the forces altering the shape of the distribution of land have brought about, by the beginning of the seventies, a vast mass of landless agricultural workers and pauperised peasants.

To discuss the nature of relations between them and the other agrarian classes, it is necessary to examine the pattern of utilisation of land and its changes over time.

Cropping Pattern and Family Farming

In other regions of India, commercial crops are grown for sale on the market mainly by the big farmers. But in Kerala, such crops are grown even in the very small holdings. Coconut is the most important of these crops which include rubber and different kinds of spices. The cropping pattern in Kerala is thus distinctly different from that of India as a whole: Foodgrains (including tapioca, an inferior cereal substitute) account for roughly 40 per cent of the cultivated area in Kerala but over 75 per cent in the country as a whole.

The cultivation of commercial crops has a long history in Kerala and has grown further in importance in recent times. The main change which has come about in the cropping pattern is the rise in the relative importance of coconut and rubber cultivation. This is partly due to topographical reasons. Paddy (the only cereal grown in Kerala) can be cropped only in the valley land while a variety of commercial crops can be grown on the slopy land. Additional land suitable for paddy cultivation has become unavailable for a long time. Thus extension to the area under cultivation has favoured the growth of commercial farming.[15]

But what is more significant for our purposes here is the high incidence of commercial cropping in very small holdings. Both poor and middle peasants are involved to a great extent in the cultivation of coconut, pepper and other commercial crops. About 55 per cent of the area under coconut, and 40 per cent of the area under pepper, are in holdings held by households cultivating in all no more than 2.5 acres each.[16] Rubber is generally cultivated on large estates but it is believed that in recent times middle peasants have

taken to rubber cultivation on a significant scale. The poor and middle peasants in Kerala are thus involved in the market as sellers of their farm products to a great extent; this is in sharp contrast to the other parts of the country where such involvement is minimal. This poses some problems to the left, as we shall see.

Commercial farming is not, however, conterminous with capitalist farming. In the holdings of the poor and middle peasants work is done largely (but not necessarily wholly) by family members. It is only in the very large holdings, of over 10 acres (roughly 4 hectares), that employment of wage labour is the predominant mode. However, as we shall see later, capitalist farming exists on a significant scale (though not constituting the predominant mode) even in holdings of 5 acres (roughly 2 hectares) and below in size.[17] Thus commercial notwithstanding its long history, has not led to a sharp polarisation of the rural population into the classes of capitalist farmers on the one hand and wage labourers with "nothing but their labour power to sell" on the other. This is not to deny that a process of differentiation is at work: indeed, the poor and middle peasants do not enjoy the advantages of the richer peasants in the markets either as sellers of farm products or borrowers of credit. But the point is that the sale of farm products by the middle peasants gives them a greater "staying power", especially in an era of rising farm prices, and slows down the process of polarisation.

II

Strategies of the CPI(M)

All-India Context

To understand the strategy of the Communist Party of India (Marxist) — CPI(M) — in Kerala it is necessary to begin with the stand of the Party on agrarian issues in an all-India context. A very clear statement of the policies of the Party, formulated on a countrywide rather than a regional basis, appears in a Central Committee (CC) resolution adopted at its meeting in March 1973 at Muzaffapur. This resolution is the result of an assessment of the experience of the Party with reference to the programme of work set out in an earlier resolution passed in 1966 and takes into account the differences which have cropped up within the party in the intervening period. There is an explanatory note by P Sundarayya added to the resolution.[18]

The resolution says that the central slogan of the agrarian movement must be: "abolish landlordism, both feudal and capitalist, without compensation and distribution of land of landlords to the agricultural labourers and the poor peasants free."[19] Commenting on the legislative measures of the Congress governments, the resolution says that while the party should extract the "Maximum possible concessions from the ruling classes, in the concrete reality of the legislative strength of the democratic Opposition as well as the mass movements outside", "no legislation, however limited, under the present ruling classes and corrupt bureaucratic set-ups, gets implemented ... unless powerful mass movements are developed".[20]

The concrete programme for struggle, laid down in this context, is based on a five-fold classification of the agrarian population: landless agricultural labourers, poor, middle and rich peasants; and landlords (both capitalist and feudal). The distinction between a rich peasant and capitalist landlord is that the former (or members of his family) participates in agricultural operations through manual labour while the latter relies wholly on wage labour. Landlords in general combine in themselves features of capitalism and feudalism and are defined in terms of an upper ceiling to the size of land, which can vary from region to region depending on fertility and other agro-climatic conditions. Notwithstanding Sundarayya's replies to certain criticisms of this formulation, the definitions and what they imply are debatable from a Marxist perspective. But what is more important is that landlords, so defined, constitute the "target of attack" for carrying out the struggle for land. The CC Resolution accordingly translates the slogan for abolishing landlordism into a programme of action by redefining land ceilings (for purposes of legislation) so as to ensure that all landlords (capitalist and feudal) are caught in the net. Sundarayya explains: "... for fixing up land ceilings, the only point with which we are concerned is what is the demarcating line between a landlord and a rich peasant."[21] Ceilings defined in terms of the resolution may thus adversely affect individual rich peasants (holding land above the limit defining landlords) but not rich peasants as a class. Thus rich peasants are outside the target of attack so far as the struggle for land is concerned.

On the whole there is some equivocation in the stand of the Party on rich and middle peasants. In the case of the middle peasantry it is best illustrated by the following sentence in the 1966 resolution: "Working class hegemony over the Kisan movement can be ensured only if the proletarian party ... places its principal reliance on the rural labourers and poor peasants who constitute 70 per cent of the peasantry, while of course not forgetting for a moment, neglecting or ignoring the middle and rich peasants but drawing them into the struggle for agrarian revolution."

The political task of drawing middle and rich peasants into the struggle, without sabotaging its proletarian character, is, of course, not an easy one, indeed, the party recognises that revisionism within the Party springs from the underlying difficulty. The 1966 CC resolution goes on to say: "The struggle against revisionism inside the Indian Communist movement will neither be fruitful nor effective unless alien class orientation and work among the peasantry are completely discarded. No doubt this is not an easy task, since it is deep-rooted and long-accumulated and also because *the bulk of our leading kisan activists come from rich and middle peasant origin rather than from agricultural labourers and poor peasants.* Their class origin, social links and the long training given to them give a reformist ideological political orientation which is alien to the proletarian class point and prevent them from actively working among agricultural labourers, poor and middle peasants with the zeal and crusading spirit demanded of Communists" (emphasis ours).[23]

How such a crusading spirit will emerge and how, in the long run, the composition of activists and leaders is to be changed in favour of those with proletarian origin, are questions relating to the organisation of the Party and need not detain us here. The concrete programme in relation to rich and middle peasants, which interests us more, appears to be dictated, however, more by the necessity of not alienating them than by fear of what compromises with them will entail. The rich peasants were not to be touched by land ceilings and while land "will be distributed to the landless agricultural labour and the poor peasants", at the same time, "for developing the united struggle for land it may be necessary to give a small portion of the land to the middle peasantry".[24]

The struggle for wages and the demand for fair prices likewise entail contradictions which cannot be easily resolved. It is not only "capitalist landlords" who employ wage labourers. Rich and middle peasants also do so, the former to a significant and the latter to a limited extent. Sundarayya notes that "partial struggles for wages can be successful only if the movement can mobilise the support of the poor and middle peasants and other democratic forces to back them".[25] Here, the underlying unity of classes is obviously to be secured through other means since in wage struggle rich and middle peasants will be on the other side of the fence. As already noted, a factor which offsets this contradiction and works in favour of unity, is the assurance that rich peasants' lands below the ceilings would be left untouched during the course of the struggle for land; the recognition of the necessity to distribute a portion of the surplus land to the middle peasants also works in the same way.

However, a stronger binding force is the struggle for "fair prices" for the farm produce of the poor and middle peasants. On how fair prices are to be determined Sundarayya quotes the CC resolution: "fair prices should be fixed ... taking [into account] the interest of the mass of the peasantry and they be such as to assure a decent living [for them] ..." Sundarayya emphasises the fact that fair prices are thus defined in terms of a "decent living" for the masses and "not just some reasonable return, or some profit".[26] It is true that the demand for such prices will bring together all sections of the peasantry for united action, but the benefits from "fair prices" accrue mainly to the capitalist farmers and make them economically and politically stronger. Sundarayya solves the problem in the following way: "When we demand fair prices that would assure decent livelihood for a middle peasant ... it does not mean that these minimum prices should be assured even to ... landlords. We can certainly raise the demand that the whole of the produce of these landlords be compulsorily procured by the government for meeting the needs of the people ...".[27] The story of support prices — and the role they have played in the Indian Economy after the advent of the Green Revolution — is too well known to be retold here. It will suffice to note that in the present political and economic situation of the country there do not exist any means, political or otherwise, for curbing the ability of the big landowners to secure for their produce high prices independently of market forces; nor do means exist for effectively taxing the rich farmers for ensuring that the benefits of fair prices accrue only to the poorer sections of the peasantry. The pursuit of the goal of 'unity' through the demand for fair prices thus works against the interests of the toiling poor.

CPI(M) In Kerala

As already explained, it was the strength and militancy of the left movement which was responsible for the successful implementation of the provisions of land reforms relating to the conferment of ownership rights to land on hutment dwellers and tenants. In contrast, the movement had not been able to prevent big landowners from successfully evading the ceiling laws. The Party is aware of this, and in accordance with its stand on the issue in the all-India context, has in recent times made these evaders the primary target for attack in the struggle for land. The implicit understanding of the Party is that if the ceiling of 10 standard acres (fixed by the 1969 Amendment) is successfully implemented, then all landlords — mainly capitalist, since feudal types have practically ceased to exist after tenancy abolition — will be virtually eliminated.

Accordingly, the 'land grab' movement of 1972, which was launched by the CPI(M) in the wake of the fierce hutment dwellers' struggle in 1970, was concerned more with unearthing surplus land (above the ceiling) and bringing it to the notice of the government than its occupation, although in a number of cases agitators 'entered' such land. The struggle lasted 80 days and about 175 thousand acres 'came to light' in the process. It did not, however, yield any land to the agitators. E M S Namboodiripad (EMS) denies that the movement was a failure. "Not that agitators must get land, but that the government must take it over to distribute it among the deserving, was the slogan of the struggle," he says. EMS regards the unearthing of so much surplus land as no mean achievement. But to him, what was a greater achievement was the fact that "... two lakh volunteers participated in the struggle ... People donated lakhs of rupees to cover the expenses of the struggle. Masses of all parts and organisations gave moral support to the struggle". To those who asked how many cents of land were secured through the movement he replies: "... let me remind them of another question, which the loyal adherents of the British asked Gandhi and Congress soon after the salt satyagraha 'How many tons of salt did you get'? Indian people went ahead ignoring these questions. The British had to leave India."[28]

The gains would of course have been more substantial if there were means for ensuring that surplus land brought to the notice of the government could be established as such and distributed. Many legal obstacles stand in the way, and, as we noted earlier, only a small part of it has been actually distributed. One can only speculate what would have happened if a CPI(M) led ministry was formed later. Not much has happened, however, on the land-struggle front after the 1972 movement until very recently (January 1979) when a second 'land-grab' movement was launched by the CPI(M). It is too early to assess the results but newspaper reports make it appear to be a satyagraha rather than a militant movement: these reports describe how hundreds of workers 'court' arrest every day in different parts of the state.

The Party can thus be seen to have avoided violent confrontations during the course of the struggle for land in recent times. But what stands out more clearly is the failure of the CPI(M) to evolve a satisfactory formula for determining the ceiling in Kerala in conformity with the party line. This failure arises partly from the confusion present in the CC resolution, but partly also, as we shall argue, from political expediency. As already noted, the CC resolution lays down the principle that the Party should agitate for a land ceiling which would ensure that all land belonging to the landlords would be confiscated when the ceilings are enforced; it further gives detailed guidelines for fixing such ceilings taking into account regional variations. It is doubtful if a ceiling of 10 standards acres would satisfy this criterion in the case of Kerala. It is well known, in any case, that land size is a poor criterion for judging the class-status of the owners. This is especially true in the case of Kerala. There are some data which show that in Kerala even among households operating areas between 1 and 2 hectares (roughly 2.5 to 5 acres) about 39 per cent rely on wage labour. Even more striking are the data for the size class immediately below which refers to households operating between 0.5 and 1 hectare (1.25 to 2.5 acres): in about 30 per cent of these households work is done largely by wage labour.[29] Any work done by the members of the family of the owner in

these cases must be more supervisory than manual in nature. Logically, therefore, the Kerala party should agitate for lowering the ceiling but it is not easy to determine the ceiling in accordance with the principles laid down by the CC: "if, say, 90 per cent of the holders of a particular size of holding, say ten to twelve and half acres wet, or 20-25 acres of dry [land] do not physically cultivate their lands, it can be assumed that holders over ten acres wet or 20 acres dry [land] are broadly, for land ceiling legislations, landlords".[30] The data required for determining the ceiling in the above manner, *viz*, the distribution of land in standard acres do not exist and hence some arbitrariness is unavoidable. But the point is that the existence of capitalist farmers operating land below the current ceiling size cannot be denied.

It may be argued in this context that the CPI(M) in Kerala is reluctant to attack "small holders". The CC defines this attitude in two clauses: (1) "Lands of small holders owning less than half the ceiling, but eking out their livelihood in factories, small shops, schools, small government jobs or as ordinary soldiers and junior army officers, or *in any other profession*, even if they are not cultivating their lands, shall not be taken . . ." and (2) "land holders, who are owning on the day of legislation less than the proposed ceiling but more than half the ceiling, but who are not cultivating their lands by their physical labour but getting them cultivated by agricultural labour, if they have other professions or means of income, *they will be allowed to retain only that amount of land that would be enough to make their total income equal that derived from the land ceiling*" (emphasis ours).[31] It is not known whether any struggle for land has taken place in accordance with the second clause mentioned above. But what is more relevant to the character of the movement is the first clause which lets out of the net numerous non-cultivating owners of highly remunerative pieces of land below half the ceiling (say, two to three acres of garden land) who derive the major portion of their income from sources other than agriculture. It is interesting to note that the West Bengal Land Reforms Act (Amendment Bill 1977) brought into being by the CPI (M) led Left Front government has a clause which ensures that such absentee owners forfeit their rights to land.[32]

In spite of the lack of conclusive data (apart from those referred to earlier which show a high percentage of small farms cultivated wholly by wage labour) it is generally believed that there are numerous 'small holders' who derive a major part of their incomes from not only salaried employment but also trade, transport and other remunerative activities. They are, moreover, organically linked to members of the urban middle classes. It is a two-way link, for in Kerala, the extent of interest in land which members of the bureaucracy — and salary earners in general — have is probably far greater than what it is anywhere else in the country. The CPI(M) is either unwilling to recognise the existence of this class or not yet prepared to fight it. The attitude of the Party in this respect is partly due to its middle class orientation springing from the class-origin of the activists and partly arises out of its concern for preserving its electoral base.[33]

It is not our purpose here to analyse the electoral fortunes of the CPI(M) in Kerala but only to attempt to understand how they are related to the character of the emerging left movement. Let us look at the struggle for wages and the demand for fair prices from this point of view. In wage struggle there are no apparent elements of compromise but viewed in combination with the nature of the land struggle, which we have discussed at length, not only do we see such elements clearly but it is also easy to understand why in the CPI(M) view unity of the peasant classes is a necessary condition for successful wage struggle. There is a trade-off here between high wage rates and the assurance of the Party that certain classes of the peasantry would be left untouched in the struggle for land. Even so, some observers attribute the recent electoral reverses suffered by the CPI(M) to the alienation of the middle and rich peasants resulting from fights relating to wages. None of this, however, belittles the achievements of the CPI(M) in raising the level of political consciousness of agricultural labourers and poor peasants.

But, as we have argued earlier, the demand for fair prices is a stronger force for securing peasant unity. The CPI(M) treads a cautious course in this respect however. It is other parties — with a clearly dominant 'landlord' interest — which clamour for high prices and the CPI(M), on occasion, accords support. The most recent example of this is in relation to the Central government's decision to import rubber. The move, which threatened the interests of rubber growers, was opposed through a resolution passed unanimously in the Kerala Assembly. Other examples, concerning coconut prices, of occasions when the CPI(M) stood alongside the other parties for protecting the peasant interest in general can be given. Here the CPI(M) is caught on the horns of a dilemma with little prospect for escape: Coconuts are cropped on a wide scale by poor farmers. It is possible that rubber is also cultivated by some poor and middle peasants. How can the party protect their interests and prevent the 'landlords' from reaping profits? A solution of this problem would require a greater confrontation of class forces than what the CPI(M) is prepared to face today.

The primacy which the Party accords to the unity of the peasant classes pays dividends but it also stultifies the movement The dividends, apart from those already discussed, also lie in the ease with which alliances can be struck and electoral adjustments made between political parties in Kerala. The CPI(M) has a large and fairly stable electoral following in the state. Given the fact that electoral victories in Kerala depend more on who is with whom (among the parties) than on the proportion of total votes that individual parties can poll (this was sharply brought to home in the last general election in 1977), the CPI(M) cannot ignore electoral calculations in formulating its strategies. To do so and lift the movement to a higher stage, what is required is a radical reorientation in the overall strategy of the Party.

Objective forces for promoting such a re-orientation are present in the changing agrarian structure, described earlier, the main feature of which is the continuous process of pauperisation. Wage labourers and poor peasants constitute the vast majority of the rural population and the movement can acquire a more pronounced proletarian character if its focus shifts more sharply in their favour. But the difficulties also arise from the forces which shape the distribution of land and the pattern of its utilisation. How to protect poor peasants without enabling the rich to reap the profits, is a question for which no readymade answers can be given. But above all, it is the attitude of the party towards rich peasants and those small landowners who derive a major part of their substantial total incomes from sources other than agriculture, which obstructs the growth of the left movement and if unchanged can make the movement progressively less and less proletarian in character.

Notes

1 Lack of comparability of data over the long period makes precise estimation of the underlying figures difficult. The conclusion holds broadly, however. For a discussion see, P G K Panikar, T N Krishnan and N Krishnaji, "Population Growth and Agricultural Development — A Case Study of Kerala", Food and Agricultural Organisation, Rome, 1978, Chapter IV.

2 The Agricultural Labour Enquiries show that while the total number of agricultural labour households increased from 500,000 to 710,000 during 1956-57 to 1964-65, those without land decreased from 240,000 to 210,000; comparable data for 1971-72 show a further decline in the latter category to 100,000. See P G K Panikar *et al*, *op cit* p 54.

3 *Ibid*, Chapter I.

4 The 1931 data are based on Census of India, 1931, Volume XXVIII, Travancore, Part I — Report, and those for 1966-67 on "Land Reforms Survey in Kerala, 1966-67", Report, Bureau of Economics and Statistics, Trivandrum, 1968.

5 These are based on the National Sample Survey, Report Nos 144 and 215. For a discussion see, P G K Panikar *et al*, *op cit*, pp 39-41.

6 Land Reforms Survey, *op cit*, Table 10.3, p 98.

7 The Land Reforms Survey comes to similar conclusions, see Chapter X of the Report.

8 For a recent survey see, "Poverty, Unemployment and Development Policy: A Case Study of Selected Issues with Reference to Kerala", United Nations, 1975, Chapter V.

9 The figures are from the Land Reforms Survey. For a discussion see Chapter X of the Report.

10 *Ibid*, p 70 and p 100.

11 The Malabar movement is well documented. Among the recent studies relevant for our purpose here are: Joan P Mencher, "Agrarian Relations in Two Rice Regions of Kerala", *Economic and Political Weekly*, Volume XIII, Annual Number 1978, pp 349-366, and A V Jose, "Origin of Trade Unionism among Agricultural Labourers in Kerala", *Social Scientist*, July 1977. In this context, see also, E M S Namboodiripad, (a) "A New Approach Needed on the Agrarian Front", *Chinta*, September 17, 1971 and (b) "Strengthen the Agricultural Workers Movement through United Struggles", Kerala Karshaka Sangham, January 1974 (both in Malayalam). In the reference last cited, EMS says: "... the anti-feudal slogan of the organised peasant movement attracted the agricultural workers also although the movement included rich peasants. The rights of the landlords to evict the tenants, increase the rent and make other exactions and the accompanying social repression disturbed the agricultural workers as well as the peasants. In short, the slogan of 'End Feudalism and the distribute the land to the peasant', created a common target for agricultural workers as well as the peasantry". (Translated from Malayalam.) In practice the struggle for land to the tenant was combined with the struggle for hutment land.

12 The data are from the "Report of the Task Force on Land Reforms", VI Five Year Plan, Government of Kerala, 1978, p 7.

13 Census of India, 1931, *op cit*.

30 Central Committee Resolution, *op cit*, paragraph 12, p 5.

31 *Ibid*, paragraphs 20 and 21, p 7.

32 For a discussion see, N K Chandra, "Major Move against Semi-Feudal Tenancy", *Economic and Political Weekly*, Vol XII, No 48, November 26, 1977.

33 For similar observations see, J M, "The Left in Kerala", *Frontier*, Vol 11, Nos 9-11, September 30, 1978. J M says: "It is the strong impression of this author that one of the major reasons why the Marxists are in trouble in Kerala is that many of the local-level leaders are now landowners. And there is a real contradiction here. Those who are leaders of the labourers are also employers of labour. A few of the former leaders and some former workers have also deserted the party, now that they have their own land . The leaders come from a high social sratum, the agricultural labourers from the lowest stratum. Today there is practically no leadership from the bottom." As we have already noted, the CC resolution of 1973 implicitly recognises these facts.

TABLE A: PERCENTAGE DISTRIBUTION OF HOLDINGS WITHIN EACH SIZE-CLASS ACCORDING TO THE NATURE OF LABOUR EMPLOYED: KERALA, 1970-71

Size of Operational Holding (hectares)	Work Done by Household Members	Largely by Members of Household but also by others	Largely by Wage-Labour	Total
0.04 — 0.25	70.30	15.47	14.23	100.00
0.25 — 0.50	51.39	26.55	22.06	100.00
0.50 — 1.00	37.97	32.09	29.94	100.00
1.00 — 2.00	28.09	33.18	38.73	100.00
2.00 — 4.00	19.36	33.49	47.15	100.00
4.00 and above	9.01	23.33	67.66	100.00

Growth of Budgetary Subsidies of Central Government

M V Raghavachari

Subsidies provided by the Government of India through the budget have recorded a phenomenal rise from Rs 7 crores in 1954-55 to Rs 1172 crores in 1977-78. Their share in the government's total budgetary expenditure has also gone up sharply from about 1 per cent in 1954-55 to 7.6 per cent in 1977-78.

This paper seeks to review the trends in budgetary subsidies and examine the ostensible purposes for which they are granted with a view to seeing if the present size of subsidies can be reduced without jeopardising the government's objectives in granting them.

ECONOMIC theory justifies subsidies if they are extended for correcting external effects, meeting 'merit' wants, helping to generate increasing returns, promoting growth and redistributing incomes. In India, promotion of growth and redistribution of income appear to be the overriding considerations in extending subsidies. The growth of subsidies in recent years is a matter of serious concern in view of the paucity of resources available for development. The Draft Five-Year Plan 1978-83 has emphasised the need for a selective approach to subsidies. The Dagli Committee[1] was asked to examine, among other matters, the justification for subsidies connected with controls and the scope for moderation or elimination of such subsidisation by suitable modification in the system of controls. The objective of this study is to analyse the trends in the growth of budgetary subsidies of the Central government and to see if the present size of subsidies could be reduced without jeopardising the basic objectives underlying them.

Subsidies provided by the Government of India through the budget have recorded a phenomenal rise from Rs 7 crores[2] in 1954-55 to Rs 1,172 crores in 1977-78. They were estimated to decline to Rs 1,019 crores in the Central Budget for 1978-79. Subsequently, in the First and Second Supplementary Demands for Grants for Expenditure of the Central government presented in August and December 1978 respectively, an additional sum of Rs 184 crores has been provided for subsidies. Including this, the provision for subsidies in 1978-79 is estimated at Rs 1,203 crores. Subsidies which formed only 1 per cent of total expenditure in 1954-55, accounted for 7.6 per cent of such expenditure in 1977-78. Subsidies have to be viewed in the broader perspective of the total availability of resources for investment. By pre-empting resources, subsidies in a way reduce the size of available resources. Therefore, a progressive reduction in subsidies at present paid by the Central government would augment resources available for productive investment.

The Economic Survey for 1977-78 observed that "one significant trend revealed by the Economic Classification of the Central Budget is the rapid rise in subsidies in various forms, such as food subsidy, export assistance, fertiliser subsidy, etc. These have more than doubled to Rs 947 crores in 1976-77 from Rs 470 crores in 1975-76. The growing need to subsidise several activities in our economy seems to stem from the *ad hoc* decisions taken in regard to pricing of commodities which are not always conducive to the maximisation of the welfare of the community as a whole. While some subsidies are unavoidable or even necessary, there are others which could be minimised or eliminated through a well integrated price policy".[3] The Bhoothalingam Study Group[4] took the view that where, in the public interest, essential commodities are provided to the economically weaker sections of the community at subsidised prices, it should be ensured that the benefits actually go to those for whom they are intended. The Study Group emphasised the need for periodic review and rationalisation of subsidies allowed to farmers and manufacturers.

Analysing the objectives behind subsidies, the Reserve Bank study observed that "subsidies are essentially meant for providing relief to the weaker sections of the society except in the case of export subsidies. To the extent to which recipients of subsidies belong to richer strata of society, the benefits would get diverted from the weaker sections. And if this is so, this would have the effect of neutralising, to some extent, the progressive effect of direct taxation and reducing the incidence of indirect taxes in achieving socio-economic objectives like restraining conspicuous consumption and investment in non-priority sectors of the economy. The redistributive effects of the subsidies may then be just the opposite of what are intended to be".[5] The Draft Five-Year Plan 1978-83, therefore, rightly emphasises that "it is necessary to bring about a drastic reduction in some subsidy rates in order to increase the availability of resources for the Plan. In general, subsidies should be admissible selectively to support low income consumption and small-unit labour-intensive production. Subsidies which do not serve these purposes should be phased out".[6]

Considerations Relevant to Subsidies

Market or quasi-market prices may be subsidised, that is, government through some kind of financial aid may make it possible for goods to be marketed at prices lower than would otherwise obtain.[7] This is using the term subsidy in a somewhat restricted sense. A broader definition would be "a government financial device which enables sellers to net more money or buyers to get more goods and services than would be the case if the affected commercial transactions had occurred without government intervention".[8] Subsidies are also described as negative category of taxes. Some subsidies take the form of direct payments by the government to some individuals despite the fact that the government does not receive any goods or services in return. Other subsidies are in the form of payments recognised to be in excess of value received by the government. Still others occur as preferential reduction in some taxes. Gary Fromm and Paul Taubmann observe that for many analytical purposes subsidies can be considered as negative excises.[9] According to Prest,[10] the mirror-image analogy between taxes and subsidies looks rather tarnished when examined closely. Firstly, these is a difference in nature — taxes contain an element of compulsion lacking in subsidies; no one is legally forced to accept a subsidy in the same way as he is forced to pay a tax. Secondly, it is not very helpful to talk of a negative analogue of all taxes lumped together

Types of Subsidy

The economic performance upon which payment of a subsidy is conditioned may be of almost any type, but common examples are production or consumption of certain goods or services, increase in use of a factor or production, and penetration of a particular market, notably the export market. Subsidies are consumer subsidies, factor subsidies, or special-purpose subsidies. A consumer subsidy is designed to benefit low-income consumers by enabling them to increase their consumption of a particular commodity or service without offsetting decrease in their other consumption. A factor subsidy is intended to benefit factors specialised to an [illegible] tion or [illegible] creasing [illegible]. Special purpose subsidies not designed to benefit either consumers or factors as such, may be aimed at attainment of a stipulated rate of economic growth and movement toward a pareto-optimum of resource allocation by capturing certain positive externalities.[11]

According to Carl S Shoup[12] in a competitive industry or trade, a per-unit subsidy on a product simultaneously increases output, raises price to the seller, and lowers price to the buyer, except in four extreme cases. "Pirce to the buyer" is market price, less the subsidy if the subsidy is paid to the buyer. "Price to the seller" includes the subsidy if it is paid to him. The effect of the subsidy is the same, whether it is paid to the seller or to the buyer, unless institutional rigidities or other frictions inhibit the free workng of the market. The four extreme cases are: (1) perfectly inelastic supply and (2) perfectly elastic demand, both of which cause the price to the seller to rise by the full amount of the subsidy, while the price to the buyer remains unchanged, so that the benefit of the subsidy rests entirely with the seller, (3) perfectly elastic supply, and (4) perfectly inelastic demand, both of which cause the price to the buyer to fall by the full amount of the subsidy, while the price to the seller remains unchanged, so that the incidence of the subsidy accrues entirely to the buyer. Usually under competition, the incidence of the subsidy is divided between buyer and seller (consumer and producer) in the ratio of the elasticity of supply to the elasticity of demand. If, for example, the elasticity of supply is very great while the demand is almost perfectly inelastic, the ratio will be large and almost all of the subsidy will go to reduce price to the buyer; price to the seller will rise by only a small proportion of the subsidy.

Effectiveness of Subsidies

A subsidy intended to increase consumption of a particular good will dissipate much of its force if the price elasticity of either demand or supply is small. If demand is of less than unit elasticity over the relevant price range, consumers spend less on the subsidised good than they did when it was unsubsidised, and more on other goods, or save more. Total spending on the subsidised good increases by less than the amount of the subsidy. In effect, part of the subsidy is dissipated in the purchase of other goods and in saving. On the other hand, if the elasticity of demand is greater than unity over the price range covered by the subsidy, the consumer decreases his spending on other goods and his saving, to increase his spending on the subsidised goods.[13] The percentage increase in units of that good exceeds the percentage that the subsidy is of the subsidised price. The decrease in spending on other goods and in saving may partly negate the aim of the subsidy, since a high elasticity of demand implies that good substitutes are available. Therefore, the social or other aims implied by the subsidy may not be achieved if expansion of the subsidised good is obtained only at the cost of reducing consumption of goods that serve the same purpose.[14]

If the subsidised good can be resold by the consumer at the unsubsidised price, his income is increased by the subsidy but the cost of the good to him is not really reduced. The cost to him is what he must forgo if he consumes the article, and in this instance what he forgoes is the unsubsidised price. The consumer will now operate as a firm taking at the subsidised price as much as the government will sell him, and reselling it at the higher price. The continued existence of the initial unsubsidised price implies that the subsidy is granted only to a very small group of consumers in a limited amount; otherwise, their offerings would drive the price down. These consumers will probably consume more of the subsidised good than before, but only because of the income effect of the subsidy. The subsidy exerts no substitution effect if resale at a constant unsubsidised price is possible.

Growth of Subsidies

Budgetary subsidies of the Central government have increased progressively from Plan to Plan. Such subsidies which amounted to Rs 133.6 crores during the First Five-Year Plan increased to Rs 151.2 crores during Second Plan and further to Rs 270.5 crores during Third Plan. Subsidies amounted to Rs 410 crores during the Annual Plans period 1966-67 to 1968-69. They rose to Rs 896 crores during Fourth Plan period and further steeply to Rs 3,007 crores during the Fifth Plan period.[15] Yearwise, subsidies have risen consistently from 1971-72 onwards and reached a level of Rs 1,172 crores in 1977-78. At Rs 947 crores in 1976-77, they were more than double the amount in the previous year (Table 1).

Subsidies as a proportion of total budgetary expenditure have fluctuated widely. They constituted as much as

10.4 per cent in 1951-52 and then declined to less than 1 per cent in 1954-55. With the steep increase in the absolute amount of subsidies during 1976-77, the ratio of subsidies has also risen sharply from 3.9 per cent in 1975-76 to 7.2 per cent in 1976-77.

FOOD SUBSIDY

A break-up of subsidies into food, export promotion and market development, agriculture and other purposes[16] is available in the Economic and Functional Classification from 1966-67 onwards. Food subsidy[17] which amounted to Rs 91 crores in 1966-67, declined to Rs 18 crores in 1970-71. It has progressively increased again from 1971-72 onwards and touched a level of Rs 295 crores in 1974-75. Although, food subsidy was doubled from Rs 250 crores in 1975-76 to Rs 506 crores in 1976-77, its share in total subsidies remained unchanged at 53 per cent (Table 2). The marked increase in the amount of food subsidy in 1976-77 is attributed to substantial increase in the buffer stocks of foodgrains and payment of arrears of subsidy relating to previous year.[18]

Table 3 provides summary indicators of budgetary cost of food subsidies in selected countries. The data are presented as a percentage of total expenditure, emphasising the impact of food subsidies on the structure of government spending. In Egypt, Korea and Sri Lanka food subsidies accounted for as much as one-fifth of total expenditure in 1974 or 1975, while several other countries devoted approximately one-tenth of expenditure to this component. Food subsidies in the case of India accounted for a relatively small proportion of expenditure. Such subsidies formed 2 to 3 per cent of total expenditure in India in 1974-75 and 1975-76.[19] The pre-emption of government expenditure by food subsidies should be viewed with particular concern in so far as sources of revenue are limited, and the public sector is expected to play a large part in the developmental effort. The large share of food subsidies in total expenditure in developing countries may be contrasted with the limited quantitative importance of these subsidies in most industrialised countries. Despite the growth in 1975, the UK food subsidy programme accounted for only about 1 per cent of total expenditure, while the US food stamp scheme accounted for only about 0.1 per cent. The actual goals of food subsidies vary among countries and in the same country over time. These aims encompass political as well as economic factors, and the use of food subsidies is influenced by institutional constraints imposed on alternative policy instruments. In most countries, an important stated objective of food subsidies is to change relative prices in a manner that provides a desired redistribution of income. A further common aim is to use subsidies to influence overall price stability.[20]

EXPORT SUBSIDIES

Subsidies for export promotion and market development scheme rose steeply from Rs 46 crores in 1966-67 to Rs 347 crores in 1977-78 (Table 2). They accounted for about 29.6 per cent of the total subsidies in 1977-78 as compared with 22.5 per cent in 1966-67. Export subsidies which amounted to Rs 268 crores during

Note: Figures in brackets represent percentage to total.
Source: Economic and Functional Classification of the Budget for the years 1966-67 to 1978-79.

* Total subsidies in 1978-79 are estimated at Rs 1203 crores including the First and Second Supplementary Demands for Grants.

Fourth Plan, rose sharply during Fifth Plan to Rs 865 crores. Export subsidies are budgeted to decline by Rs 86 crores to Rs 261 crores in the Central Budget for 1978-79. However, an additional sum of Rs 129 crores was provided for export promotion and market development in the First and Second Supplementary Demands for Grants. Export subsidies as a proportion of total exports increased from 4.2 per cent in 1966-67 to 6.5 per cent in 1977-78. The combined share of food and export subsidies in total subsidies is placed at 70.5 per cent in 1977-78 as against 67 per cent in 1966-67. Category-wise break-up of export subsidies is presented in Table 4. In 1977-78, a large proportion (90 per cent) of the export subsidies were given for product promotion and export development organisations.

Commenting on the inconsistencies in export subsidies, Bhabatosh Datta[21] observed that "if instead of expressing the amount of export incentives as a ratio of total exports, or even of the exports of the commodities actually enjoying the advantages, one takes into account only the net foreign exchange earned case by case, the absurdities of some of the results will appear to be astounding. According to an official report recently quoted, a cash assistance of Rs 1.15 lakhs was given for the export of a commodity, which brought in a gross total of Rs 3.83 lakhs, after using imported materials worth Rs 3.79 lakhs. The cash assistance of Rs 1.15 lakhs was thus given for a net foreign exchange earning of Rs 4,000 or $ 470, which meant an implicit rate of Rs 245 of cash assistance for each dollar earned. This may be an extreme case, but it is necessary to examine carefully each one of the export assistance schemes to find out if it is really necessary and, if so, what is the cost that society has to bear for making the exports possible or profitable".

According to a study on Export Assistance Policy,[22] public funds spent on trade and export promotion in India are found to be far higher than in other countries. Trade and export promotion expenditure per US $1 million of export earnings in India in 1975, was found to be $ 39,805, as against $ 2,081 in the UK, $ 1,146 in Italy, $ 564 in Japan, $ 514 in France, $ 316 in Canada, $ 220 in USA and $120 in West Germany. To a large extent, the differences in public expenditure on export promotion stem from the differences in the strategy of export promotion. The main lever of export promotion in India is cash subsidy, which is "widely recognised as a self-perpetuating crutch that reduces the incentive for cost reduction and quality innovation, while in foreign countries the public fund is primarily spent on developing marketing capabilities through market intelligence and matching competitive mar-

keting strategies including payment terms".[23]

The export assistance schemes were introduced at a time when there was a need for improving the country's balance of payments position. There are many things which come into existence for one purpose and then continue to exist for other purposes. In the case of protective import duties and export subsidies, industrial [illegible] in their continuance grow up and after a time it becomes difficult to remove or modify the assistance. It is not remembered that the whole idea of such assistance is to tide over initial or temporary difficulties. The continuance of the assistance becomes a part of the producers' parameter of expectations. These subsidies are not always removable when their purpose is achieved. The assistance to exports in a period of healthy balance of payments position requires careful examination. It is, therefore, necessary to make a case-by-case examination of the costs of the export incentives *vis-a-vis* the benefits derived from them.[24]

END-USE OF SUBSIDIES

Available data on subsidies indicate that the share of developmental subsidies comprising economic[25] and social services[26] in total subsidies declined from about 56 per cent in 1966-67 to 47 per cent in 1976-77. On the other hand, the share of consumption subsidies[27] increased from 44 per cent to 53 per cent in 1976-77. Consumption subsidies which amounted to less than Rs 4 crores in 1968-69, have grown over 121 times to Rs 485 crores in 1978-79. Both developmental and consumption subsidies more than doubled in 1976-77 as compared with the previous year (Table 5).

Break-up of data regarding subsidies for fertilisers, edible oils, controlled cloth, imported cotton, transport of coal, interest subsidy, subsidy to new industrial units in selected backward areas and subsidy to Bharat Gold Mines is not available in the Economic and Functional Classification of the Budget. However certain data are available in the Explanatory Memorandum on the Budget of the Central government for 1978-79 and Demands for Grants for individual ministries. Available data on subsidies on some items are presented in the Appendix.

Under the Fertiliser Retention Prices Scheme introduced for nitrogenous fertilisers in November 1977, retention prices have been fixed for each unit producing urea, ammonium sulphate and calcium ammonium nitrate. The Fertiliser Industry Co-ordination Committee operates a Fertiliser Price Fund to receive from and pay to manufacturers of these fertilisers the differentials between their ex-factory realisations and the individual retention prices fixed for each unit. Budgetary support is provided to the Fertiliser Price Fund to meet the payments due therefrom to the manufacturers of nitrogenous ferti-

lisers.[19] A sum of Rs 125 crores was provided on this account in the Budget for 1978-79 as against Rs 25 crores in the revised estimates for 1977-78.

With a view to improving the offtake of imported rapeseed oil and bringing greater relief to the consumers, a subsidy of Re 1 per kg is provided by the Central government on its retail price. A sum of Rs 8 crores was provided in the 1978-79 Budget for payments to the state governments and other parties on vegetable oils.

Imported cotton is subsidised to keep cotton prices at a reasonable level. Accordingly, a sum of Rs 54 crores was reimbursed in 1977-78 to the Cotton Corporation of India for losses incurred on sale of imported cotton. A provision of Rs 2 crores is made in the current year for this purpose.

Subsidy is paid by the Ministry of Energy for rail-cum-sea transport of coal. This subsidy is budgeted at Rs 5.66 crores in 1978-79 as compared with Rs 3.85 crores in the preceding year.

Subsidy is also provided to new industrial units located in selected backward areas in various states and Union Territories. The subsidy on this account is budgeted at Rs 15 crores in the current year. Commenting on this, the Draft Plan observed that "at present the benefits from this subsidy are concentrated in a few districts/areas. Moreover, no attempt is made to discriminate in favour of the sorts of industries that could have a major impact on the district/area in terms of employment or resources development or forward linkages. For instance, the amounts given as subsidy are not related to employment but to capital investment. The extent to which the subsidy has helped to promote the overall level of development in backward areas has yet to be assessed".[20]

Further, interest subsidy is given to Steel Authority of India, Indian Iron and Steel Company, Heavy Engineering Corporation, Khadi and Village Industries Commission and so on (Appendix).

Summary and Conclusions

Subsidies provided by the Government of India through the budget have recorded a phenomenal rise from Rs 7 crores in 1954-55 to Rs 1172 crores in 1977-78. Their share in total expenditure rose sharply from 1 per cent in 1954-55 to 7.6 per cent in 1977-78.

Budgetary subsidies of the Central government have increased progressively from Plan to Plan. They had increased from Rs 134 crores during First Plan to Rs 151 crores during Second Plan and further to Rs 276 crores during Third Plan. During Fourth Plan period they rose to Rs 896 crores. Subsidies have risen enormously to Rs 3,007 crores during the Fifth Plan period.

Food subsidy has increased by about 27 times from Rs 18 crores in 1970-71 to Rs 479 crores in 1977-78. In Egypt, Korea and Sri Lanka food subsidies accounted for one-fifth of total expenditure in 1974 and 1975. Food subsidies in the case of India accounted for a relatively small proportion (2 to 3 per cent) of expenditures. Even so, the pre-emption of government expenditure by food subsidies is a matter of serious concern. In view of the severe budgetary constraints, it is not desirable to have a simple across-the-board approach to food subsidies. Food subsidies can be progressively reduced by differentiating the treatment of various groups. Food subsidies are largely intended for lower income groups. Therefore, such subsidies should be extended only to non-income tax paying sections of the society.

Subsidies for export promotion and market development scheme rose sharply from Rs 46 crores in 1966-67 to Rs 347 crores in 1977-78. They accounted for about 29.6 per cent of the total subsidies in 1977-78 as compared with 22.5 per cent in 1966-67. Export subsidies as a proportion of total exports increased from 4.2 per cent in 1966-67 to 6.5 per cent in 1977-78. The combined share of food and export subsidies in total subsidies is placed at 70.5 per cent in 1977-78 as against 66.9 per cent in 1966-67. Assistance of this order to exports in a period of healthy balance of payments position requires careful examination.

During the period 1966-67 to 1976-77, while the share of developmental subsidies in total subsidies declined, the share of consumption subsidies increased. Consumption subsidies which amounted to less than Rs 4 crores in 1968-69, have grown over 121 times to Rs 485 crores in 1978-79.

A progressive reduction in subsidies at present paid by the Central government would augment resources available for productive investment. To the extent to which the recipients of subsidies belong to richer strata of society, the objective of vertical equity of taxation gets distorted. Subsidies are not always removable when their purpose is achieved. In view of the self-perpetuating nature of subsidies, the choice of goods which are to be subsidised must be carefully made and revised from time to time.

Notes

1 A Committee under the Chairmanship of Vadilal Dagli was set up by the Government of India in February 1978 to evaluate and review the system of controls and subsidies and to examine the manner in which they have actually operated and whether the objectives sought have been achieved.

2 The data on subsidies and total ex-

Statement about ownership and other particulars about newspaper *ECONOMIC AND POLITICAL WEEKLY* to be published in the first issue every year after the last day of February.

14 In certain cases, a subsidy can decrease the number of units consumed of the subsidised good. This will occur if the thing subsidised is a giffin good within the price range covered by the subsidy, that is, if both (1) the income elasticity of demand is negative and (2) the income effect of the subsidy outweighs its substitution effect.

15 Covering the four-year period 1974-75 to 1977-78.

16 These include subsidies for industry other than exports, transport and communications, controlled cloth, edible oils and so on.

17 Food subsidy is paid to the Food Corporation of India on account of reimbursement of the difference between the Central issue prices of different foodgrains and the economic cost of these foodgrains to the Corporation. The economic cost includes procurement price or purchase cost and procurement incidentals for indigenous grains and Ocean freight and landing charges in the case of imported foodgrains as well as [illegible]ement, storage and other miscellaneous charges.

18 Government of India, Explanatory Memorandum on the Budget of the Central Government for 1977-78, pp 42-43.

19 Although food subsidies touched a peak level of Rs 506 crores in 1976-77, they constituted only 3.8 per cent of total expenditure in that year.

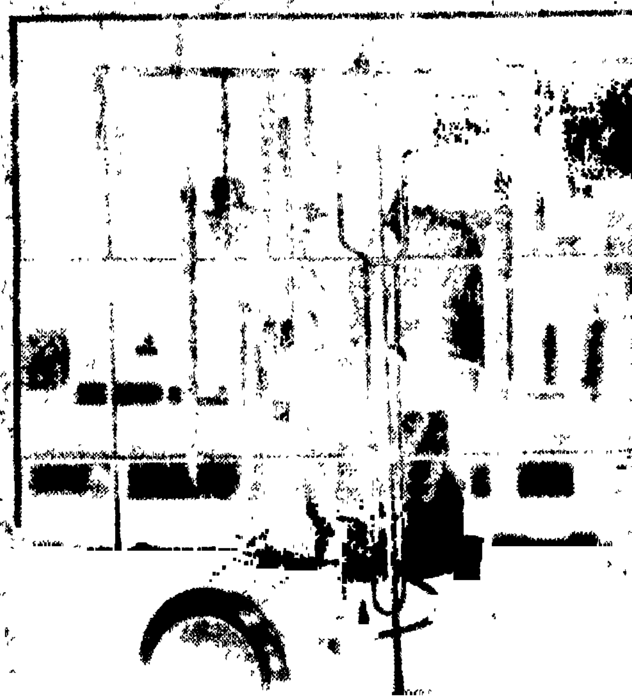
Can oxygen have a nationality?

With its foreign equity reduced to less than 40%, Indian Oxygen Limited today is truly Indian. In that sense oxygen now has a nationality.

However, in outlook and spirit IOL has always been Indian. Ever since it began operations in this country (as a member of the BOC Group), IOL has pioneered a variety of products and processes for India's developing industries.

Today IOL's contribution lies not only in its service to Indian industry and priority sectors such as defence and health but significantly also in the reservoir of indigenous talent and technology it has built up. Over 20,000 welders in the country today are products of IOL's welding schools.



Today as an Indian company, IOL looks back with pride and looks ahead with determination to play an even greater role in the nation's industrial and economic development. We may have reduced our foreign equity, but we've enlarged our national commitment.

IOL

Indian Oxygen Limited

Always Indian in spirit now Indian in fact

but ACC is mo than just cement...

It's also Research and Development working on import substitution and better utilization of national resources

ACC's Research and Development division at Thane (near Bombay) is a sophisticated research unit. The scientists there, working on many fronts, are continuously involved in not only conventional product development but also diversified research activities of national importance.

Import substitution: Alumina ceramics, activated aluminas, molecular sieves—all critical to India's fertilizer, petrochemical, cryogenic, petroleum refining, steel and metallurgical, chemical and other allied process industries.

Better utilization of resources: Just one example—calcium carbonate sludge, a 'waste' product of the fertilizer industry, is today a raw material for portland cement.

Product development: A diversified range of cements and allied products such as Silvicrete, Oil-well cement, Shrinkkomp, Rediset, etc.

In-house quality control: Constant tests to maintain and improve the quality of cement produced by ACC's 17 plants all over the country. And unending attention to operate plants at peak efficiency.

Research and Development at ACC is a driving force for the company's growth and vitality.

[illegible]

[illegible] Kosygin's speeches on the very first two days of the visit [illegible] important questions [illegible] with the [illegible] to [illegible] towards other countries.

On the first two days of his visit, Kosygin delivered four major addresses: to the members of the Indian Parliament, at the banquet by Prime Minister Morarji Desai, at the meeting organised by the [illegible] Cultural Society and at the civic reception in his honour in New D[illegible] most striking feature of Kosygin's speeches on all these occasions [illegible] virulent criticism of China. It was in his address to Parliament th[illegible] the fullest vent to his petulance on the subject of China. Referring [illegible] aggression against Viet Nam", the Soviet Prime Minister said: "[illegible] armed robber or murderer struck somebody, all the rigours of the la[w] applied to him in any country. And it cannot be otherwise. But one [would] like to know what punishment deserves a criminal who has encroache[d on the] life of an entire nation and who seeks to assume the right to [illegible] other peoples and decide their fate as he pleases? No peace-loving coun[try] no person of integrity should remain indifferent when that sort of [illegible] happens, when an aggressor holds human life and world public opinion [in] insolent contempt, commits an outrage against international law, against [the] great principles of peace and independence, sovereignty and equality, [illegible] everything which has become the banner of the peoples in the struggle [illegible] domination and oppression, for a better world and happier future. [He] continued: "Indeed it would be unpardonable if the least opportunity [were] [illegible]ed for co-operation in the struggle against aggression and against [the] policy of blackmail and diktat..." Finally, he added: "On behalf of th[e] Soviet Union's Supreme Soviet, I can assure with full responsibility that an[y] initiative by the Parliament of India serving that goal [of co-operation in] the struggle against aggression, blackmail, diktat, etc] will find our most active support." While he did not dwell on the subject at quite the same length in his other public speeches, the vehemence of Kosygin's attacks on China was much the same.

The Soviet Prime Minister's homage to the "great principles [of] independence, sovereignty and equality" is, of course, less than fully credible given the Soviet Union's domination over and tight control of the countri[es] of the Soviet bloc in Eastern Europe and given the Soviet Union's record o[f] armed intervention in countries like Hungary and Czechoslovakia to remove from power governments which had dared to stray from the strait and narrow path as laid down by the Soviet Union. The hypocrisy of Kosygin's call to the Indian Parliament for "co-operation in the struggle against aggression and against the policy of blackmail and diktat" is exposed also by the fact that just three months ago the Soviet Union had aided and abetted Viet Nam's invasion of Kampuchea with the express purpose of overthrowing a government which was thought to be unfriendly to Viet Nam and the Soviet Union. The puppet character of the regime installed in Phnom Penh by the Vietnamese is so universally acknowledged that no government, except those of a handful of Soviet bloc countries, has recognised it till now. Then there is also the question of diplomatic norms and proprieties. The use of an official visit to launch unbridled attacks on a third country can only be taken to reflect complete indifference to the sensitivities of the host country and its government and people. Another recent action of this type was the extraordinary step taken by the ambassadors of the Soviet bloc countries in India of calling a press conference in New Delhi to condemn the Chinese attack across the China-Viet Nam border. These are apparently liberties which the one or the other Superpower feels it can take with countries which it thinks are sufficiently beholden to it not to be able to call it to order.

None of these, however, is the most significant aspect of the Soviet Prime Minister's public pronouncements in New Delhi. What makes them most worthy of careful attention is that they constitute a plain attempt to interfere with India's relations with China. It is the stated policy of the [illegible] [illegible] and improve relations with China. In a [illegible] [illegible] the Indian External Affairs Minister recently visited [illegible] [illegible]

suggestion that India should co-operate in the struggle against China's alleged 'aggression, blackmail and diktat' are clear enough notice that the Soviet Union will not look kindly upon any improvement in India's relations with China. In fact, the Soviet Union has for long made known its opposition to any steps by India to improve India-China relations and the China-Viet Nam border war has only come as a convenient excuse for pressing this opposition more openly and firmly. Thus as far back as in March 1978, the mere visit of a Chinese goodwill delegation to India had provoked the Soviet ambassador to Nepal to declare in a press statement in Kathmandu that "whatever may be the intention of Peking in improving relations with India and other neighbours, the logic of national interest of these countries will prevent the Chinese from achieving their main foreign policy objective of drawing them into the anti-Soviet orbit". The Soviet ambassador had further added, "everyone knows that the friendship of these countries [India and other neighbours of China] with the Soviet Union accords with their national interests. Therefore, he who goes against national interests cannot remain in power for a long time". It has always been the self-appropriated privilege of the powerful nations of the world — once the colonial countries, now the two Superpowers most of all — to decide on behalf of other countries what is in their national interest. The United States has exercised this privilege in relation to countries in far-flung corners of the world; so now does the Soviet Union as the other Superpower. It was not very long ago that the Soviet Union had pronounced that the Indira Gandhi regime and the Emergency were just what the Indian people needed.

In India, the Soviet Union has acquired very powerful levers of control in the shape of, among other things, the Indo-Soviet Treaty of 1971, India's overwhelming dependence on the Soviet Union for arms imports and the Soviet Union's large-scale involvement in India's foreign trade and in many sectors of the Indian economy. (The Soviet Union has been for almost the last decade and a half India's main arms supplier and it has alternated with the United States from one year to another as India's principal trading partner.) It will be sheer make-belief on India's part to think that these levers will not be used with increasing ruthlessness, as is now being done to check the process of normalisation of this country's relations with China. The Soviet Prime Minister's current visit has served to bring this fact more into the open.

Politics

Escaping from Reality

LAST WEEK's two-day conference of Governors deserves to be noted for two reasons: the President's address to the Governors where he has once again expatiated on some pet themes; and the perception of the problems facing the country exhibited by the participants.

The President's observations on the increasing contradictions between socio-economic development and social justice that are besetting Indian society are, as usual, apparently unexceptionable; the concern for "the large masses of very poor people living in squalid urban slums, small and marginal farmers, artisans and landless agricultural labourers in rural areas who are under-employed and whose incomes are too meagre to provide two square meals a day...." is indeed touching. The sting, however, is in the 'contrast' which the President invites his audience to see between this portrait of the rural and urban poor and "the affluent and the employees in the organised industry and in corporations whose incomes and perquisites are well above the general economic level of the population". Note that there is no attempt to make any distinction between the "affluent" and the "employees in organised industry"; or between the "incomes and perquisites" received by these various sections of organised labour and the "affluent" who actually employ that labour power. The attitude is exactly the same as was revealed in the President's address to the nation on the occasion of the Republic Day (*EPW*, January 27).

With the keynote of the Conference being set in such terms by the President, it is scarcely surprising that the Governors too showed an absolutely innocent understanding of the pressing problems facing the country. Thus, in the fourteen months since the Governors met last, the general economic and political situation in the country has further worsened; vast areas of the country are without any kind of government worth speaking of; the political system has disgraced itself beyond belief; many artificially divisive issues are deliberately being encouraged and fostered by leaders of the ruling party with a view to keeping themselves in power while a fraudulent 'consensus' is sought to be imposed on the whole nation; the attacks on the toiling people in the fields and factories have shown no signs of abatement; and a member of the national police commission has lifted but a small corner of the vast veil that covers the horrors and injustice that mark the functioning of the country's legal and criminal administration.

But there is little indication that the Governors were actually aware of the reality around them. Instead, and astonishingly enough, "student indiscipline and growing Naxalite activities were the two main problems highlighted by governors on the concluding day of their two-day conference". The conclusion is inescapable; since most students and many of the 'naxalites' are young, what the Governors have called for is a war on the young people of the country.

Credit Policy

Gone Awry Once Again

THE Reserve Bank has called a meeting of bankers on March 15 at the end of which it is likely to announce certain riders to its credit policy. It does not appear, however, that the Reserve Bank will be either inclined or able to make more than perfunctory changes.

The Reserve Bank had raised the statutory liquid ratio (SLR) of banks from 33 to 34 per cent, and stipulated that during the period December 1, 1978 to end-March 1979 the ratio of banks' incremental non-food gross credit (that is, bank credit excluding food procurement credit but including bills rediscounted with the Reserve Bank) to their deposits should be held "well within" 40 per cent. These directions were announced by the Reserve Bank on November 28, 1978 following a sharp spurt in bank credit by Rs 798 crores during the eight weeks ended November 17, 1978 (against an expansion of Rs 306 crores in the corresponding period of the previous year) which gave an incremental credit-deposit ratio of nearly 100 per cent. In calling for a slowing down of the pace of credit expansion, the Reserve Bank underlined the importance of extending credit "only for legitimate purposes", implying that the 100 per cent incremental credit-deposit ratio had stemmed from credit expansion for purposes which were not strictly legitimate.

It is difficult to say how meaningfully the SLR stipulation has been fulfilled, since it is open to banks to borrow from the Reserve Bank and use the borrowings to cover their SLR

obligations. That this has in fact been happening is no secret in banking circles, and is also suggested by the rise in the banks' non-food refinance from the Reserve Bank by Rs 248 crores to Rs 447 crores between the end of December and the end of February. In any case, there was a further sharp rise in non-food gross bank credit, by Rs 1,278 crores to Rs 16,784 crores between December and February 24, 1978. Since during that period deposits had increased by Rs 1,284 crores to Rs 26,200 crores, the incremental credit-deposit ratio was once again almost 100 per cent. The Reserve Bank's directive to banks to restrict their non-food gross credit to deposits ratio to "well within" 40 per cent thus seems in retrospect to have been a laughable proposition. Either the banks treat the Reserve Bank's directives with total indifference or the country's central monetary authority has so little grasp of the actual monetary and credit situation that it issues directives which are completely unrealistic and cannot possibly be implemented.

Where has all the credit gone? A conspiracy of silence among bankers and the Reserve Bank greets the question which is ducked by vague references to things having gone awry during the bankmen's strike last year-end. Non-food gross bank credit expansion since March 1978 has been more than double what it was in the corresponding period of the last year. This order of credit expansion cannot be explained away simply by the bankmen's strike, especially since the galloping trend was in evidence long before the bankmen's agitation and has continued merrily thereafter. Not much of the credit expansion has gone into such sectors as coal, steel and electrical goods or even fertilisers, cotton and sugar. Cotton textiles and other textiles excluding jute seem to have tapped sizeable credit along with dyes, chemicals, metals, rubber and leather. These, interestingly enough, are also the areas which have witnessed substantial price increases. Thus the wholesale price index (base: 1970 71=100) for basic metals, alloys and metal product showed a rise of 10 per cent during the 12 months to February 10, 1979. The rise in textiles was 3 per cent, chemicals 3.5 per cent, leather and leather products 26 per cent and rubber and rubber products 21 per cent. Credit has thus gone into the very sectors which have experienced a price buoyancy, though bankers led by the Reserve Bank are trying hard to conceal this situation.

Industry and trade, it is clear, are operating on the expectation that inflation is round the corner and that big killings would be theirs in the not-too-long run. They cannot be very wrong either, considering that money supply expansion during the current year is most likely to touch 20 per cent. And by openly taking the position that the burden of correcting money supply expansion, bloated by budgetary deficits, ought not to fall too heavily on bank credit to the commercial sector, the Reserve Bank has tacitly assured industry and trade that any undue tightening of the credit screw will not be allowed to spoil things for them.

Tea

Multiple Bonanzas

WITH the announcement of the complete abolition of export duty on tea on February 14, the demands of the tea industry have been fully met by government. The duty, imposed at the rate of Rs 5 per kg on exports of bulk tea on April 9, 1977 by the new Janata government, was intended to mop up some part of the huge profits industry had been making on exports: the measure was also intended to put a rein on uninhibited export of a mass consumption product which had steeply pushed up domestic prices.

But the tea industry never reconciled itself to this. Throughout 1977, there were many inspired reports of how the long established traditional foreign markets for Indian tea were being lost because Indian tea had become uncompetitive in the international market, being supplanted by countries like Sri Lanka, Kenya and even Bangladesh, in most of which countries, industry argued, export of tea actually received subsidies. Though in 1977-78, despite the export duty, the total amount of tea exported actually slightly exceeded the target of 225 million kg, in 1978-79, the situation till the third quarter of the year was distinctly depressing; but with the reduction of the export duty from Rs 5 a kg to Rs 2 a kg in September 1978 and with its total abolition last month, it is possible that the stipulated target of export of 200 million kg for the year might still be reached. Industry forecasts presently put exports at around 180 million kg; and even at this level, the total realisation might not be significantly lower than what it was in 1977-78.

Even more than the panicky reversal of the modest measures to regulate tea exports, government has also simultaneously announced, or is reported to be contemplating, a whole series of further measures which together actively seek to encourage tea industry and provide it 'incentives' to grow and export more tea. Various fancy projections are made about the total amount of tea the country would need to produce by the year 2000 and the necessary expansion programme to meet those projected demands. The most urgent need, apparently, is to dramatically expand the area under tea cultivation; the problem of replantation and replacement of bushes in existing gardens, a task long overdue and one in which industry has consistently shown little interest, is also taken care of, though it is given less importance. In both these undertakings, financial assistance on very generous terms is already available to any entrepreneur; what the government proposes to do is to make these terms even more attractive. Thus, presently, for financing plantation and development schemes in 'traditional' areas, loans of Rs 20,000 per hectare of plantation in the plains areas and Rs 25,000 per hectare of plantation in the hill areas, with interest at 9.5 per cent, and with a provision of rebate of 0.5 per cent on prompt repayment are granted — the repayment itself to commence in the seventh year after the grant of loan and to be completed in the fifteenth year. Considering that an estimate of the cost (per hectare) of planting and maintaining of a tea plantation (made by the ARDC) works out to be Rs 18,500 for the first year, with additional expenses of Rs 3,650, Rs 3,850, Rs 4,350 and Rs 4,550 in the subsequent four years, one should have imagined that the present provisions are quite generous. But there is apparently to be a soft loan plan for tea estates in 'new areas' (these for the most part are still located in the northeast, in the peripheral regions of Assam, and in many cases could even be contiguous to an existing tea estate) according to which 50 per cent of the total cost of development would be available as a loan, at 7.5 per cent interest; 30 per cent of the total cost would be an outright subsidy; and the remaining 20 per cent would need to be actually put up by the entrepreneur. Moreover, unlike in the existing scheme, there is to be no ceiling on costs; and for the first five years, no interest on the loans is to be charged either. Even the existing subsidy on replantation — a measure quite uncalled for and resorted to only because government has not been able or does not want to persuade the plantation owners themselves to dip into their

huge profits and plough back a small part of it into replantation — which (fixed more than a decade ago, moans the industry) works out at Rs 4,000 per hectare (Rs 5,000 for plantations in hill areas) is apparently proposed to be simply doubled.

But these are not all. The panic has been of such a kind that a whole lot of industries ancillary to the export of tea are also not being forgotten. There is to be a 'review' of cash assistance scheme already existing for the promotion of export of packet tea, instant tea and teabags; the levy on tea sale auctions is alleged to be having a 'crippling effect on the tea industry' and this too might be 'revised'; there is talk of raising the cash compensatory aid for export of tea caddies; in order to encourage export of packed tea, the import of tea bag machines is to be subsidised by a loan of 80 per cent of their actual cost; and one does not know what further areas of the trade might yet be open for further bonanzas. On the top of it all, because of the increased hold-over of stocks consequent upon the anticipated fall in exports, the carryover from last year's stocks and the expected bumper crop this year (1978-79), the industry has also put forward a plea for 'special accommodation' by banks in financing unsold teas and more time for liquidating this portion of the finance.

Integrated Commodity Fund

Redressing the Imbalance

THE non-oil poor countries today together hold over $ 60 billion in foreign exchange reserves, the bulk (over 80 per cent) in dollar reserves. The oil exporting countries hold another $ 70 billion as foreign exchange reserves, in addition to the vast amounts they have invested in the industrialised countries, particularly since the oil prices were quadrupled towards the end of 1973. The retrograde resource transfer involved in the poor countries holding short-term liabilities of the rich countries is the outcome of the world monetary system hatched by the rich countries. But there is no reason why the developing countries, much less the non-oil developing countries, should acquiesce in these arrangements to the extent of allowing resource transfer from themselves to the rich reserve-creating countries.

Delivering the Fourth A G Dutt Memorial Lecture at the Centre for Studies in Social Sciences, Calcutta, on February 11 and 12, I S Gulati referred in this context to the attempts by the non-oil poor countries, through various international forums, to (a) establish a common fund for the financing of stockpiles of various important commodities of export interest to them and (b) improve upon the existing compensatory financing arrangements so that they provide them a much more adequate cover against shortfalls in export earnings. While the negotiations on the Common Fund appear to have reached a point where only a very weak fund may be acceptable to the rich countries, the discussions on compensatory financing seem to be intended primarily to divert attention from the Common Fund.

However reprehensible one may consider the present world monetary system which generates such regressive transfer of resources from the poor to the rich countries, Gulati felt that the poor now have a rare opportunity in the form of the sizeable reserves held by them, which opportunity they must get together to seize. As he put it, here is "an excellent opportunity to use these reserves to give adequate backing or support to the commodities they trade in". He suggested that the non-oil poor countries should meet urgently and agree on establishing an Integrated Commodities Fund with a subscribed capital of $ 3 billion and power to raise, with government guarantees, another $ 10 billion from the international capital market. This fund would finance both the stockpiling arrangements as well as shortfalls in export earnings of these countries.

Gulati clarified that the suggestions he was making derived not from the belief that international monetary reserves needed a commodity base but from the belief that the commodities produced and exported by the non-oil poor countries need the reserve backing. These countries depend on a few primary commodities for the bulk of their export earnings. One to three commodities account for more than 50 per cent of the total export earnings of about three-fourths of these countries. Moreover, these earnings are subject to violent fluctuations, thanks largely to fluctuations in prices in a market in which they are at the mercy of strong monopsonistic pressure groups.

That there is an urgent need for an international arrangement whereby the prices of the primary products of these countries can be stabilised in a manner that they can be assured of steady income in real terms is generally accepted. But must the poor countries wait till the rich countries see reason and agree to the establishment of satisfactory arrangements? Clearly, no. The poor countries possess right now the wherewithal to establish satisfactory arrangements on their own. In this matter, Gulati felt, India could play a leading role by offering to subscribe to the proposed Integrated Commodities Fund, taking into account the fact that it now holds foreign reserves which, in relation to its imports, are far in excess of the all-world average.

The proposal for a Commodities Fund is well-timed in that in a few months the international comunity will be meeting at Manila for UNCTAD V and taking stock of the situation with respect to the measures proposed at Nairobi in 1976. The developed world feels reasonably certain that it has effectively killed the Common Fund. Whatever UNCTAD succeeds in resurrecting at Manila might, if at all, be a pale shadow of the grand design. Likewise, at the IMF, the efforts at instituting special compensatory financing arrangements for the poor primary producers have made little headway. In the circumstances, should not the poor seriously question the need for the Manila meeting? Why not instead meet among themselves at once and take effective measures within their reach?

LETTERS TO EDITOR

Permanent Settlement in Champaran

THIS has reference to the review of my book "Agrarian Problems of Permanent Settlement: A Case Study of Champaran" by N Benjamin (January 6). The review is replete with inaccuracies and distortions and shows lack of familiarity with the permanent settlement and in particular with my district.

The reviewer says: "Originally the government land revenue demand was fixed at a very high rate. On p 8 Mishra says that it 'was generally fixed at ten-elevenths of the existing rental .' But on p 15 he contradicts himself and writes, 'In the beginning the margin of profit allowed to zamindars. .was generally one-tenth of the government.. '. I do not contradict myself; only the reviewer shows his ignorance of elementary arithematic. Let us say the existing rental was Rs 99. Then the government revenue would have been: Rs 99 × 10/11 = Rs 90. The zamindar's profit would have been: 1/10th of the government revenue, i e, Rs 90 × 1/10 = Rs 9. The government revenue (Rs 90) + the zamindar's profit (Rs 9) = the existing rental (Rs 99).

The reviewer's second charge is that I have not given the date to which the budget of the indigo factory relates. Watt in his "Pamphlet on Indigo" published in 1890 has not given the year but in turn has quoted from some journal. The fault does not lie with me.

The third charge is that I have not said that the money-lenders of Champaran were also grain-traders and were trying to grab the agricultural produce of the peasants when they became indebted. It is unfair on the part of a reviewer to force an author to accept his ideas even if they are not supported by facts. In this particular case, may I point out that Champaran was not the Decan? Very few money-lenders were traders in agricultural produce. I shall be grateful if Benjamin cites facts relating to Champaran.

The fourth charge is as follows: "As regards the rent-free landholders, Mishra writes, 'their share in the total occupied area of the district went down from 2.10 per cent to 1.30 per cent' (p 200). He does not specify the years to which these figures relate. Nor does he account for this change". May I draw Benjamin's attention to page 198 where it is explicitly stated that the comparative data relate to two settlements. If the reviewer had looked at Table No 6.12 on page 199 and at page 198, he would not have rushed to criticise. He should have cared to read the next line on page 200: "The very considerable reduction in the rent-free area was due partly to the decline of temporary maintenance grants of land, partly to the reversion to the landlord of numerous birts or grants and in a very few cases to rent-free entries of the earlier settlement being successfully contested."

Lastly, before criticising me for not giving more details of the records lumped as Bettiah Raj Records and Motihari Collectorate Papers, I would have liked the reviewer to have had a look at the note on the bibliography in Appendix 2. He also seems to be oblivious of the state of zamindari and other revenue records in the erstwhile permanently settled areas.

Cornwallis's hope that the permanent settlement would extend the market for British goods is not of doubtful authenticity. Had it been the purpose of the book to dwell on the reasons for and circumstances of the introduction of the permanent settlement, the reviewer should have got more details from me. My aim is to study the working of the permanent settlement. May I point out that this is the first complete study of this kind and relates to the district which I have intimately, and thoroughly known for more than 35 years?

The price of the book is not Rs 55 but Rs 45.

GIRISH MISHRA

New Delhi
January 16

N Benjamin replies:

Girish Mishra's comments on my review of his book gave me an occasion to go through the book again and this has confirmed the views which I had expressed earlier. I would like to take up his points one by one.

First, the question of land rental. Suppose it was Rs 11,000 and the government demand was fixed at 10/11. In this case, the zamindar's profit would be Rs 1,000. Let us take another case and suppose that the zamindar's profit was 1/10 of it. In this case, it would come to Rs 1,100.

Second, Mishra says that he depended on Watt's pamphlet for the budget on an indigo factory and that if he has not given the year to which the budget pertains to, it is because Watt has not given it. As Mishra says, Watt's pamphlet was published in 1890. Hence, it is likely that the budget is with reference to the 1870s or the 1880s. Mishra has not only not attempted to make an exercise on these lines, but has given an excuse which, to say the least, is unconvincing.

Third, my suggestion that the money-lenders were also grain-traders has been conceded by him, albeit haltingly, when he admits that "very few money-lenders were traders in agricultural produce". This problem certainly requires further exploration, as I suggested.

Fourth, as regards the period of decline in the share of rent-free landholders in the total occupied area, Mishra's explanation makes it clear that his account of this problem is clumsy and hence bound to mislead the reader. Similarly, he has sought to account for the phenomenon in just one passing sentence and, therefore, has not done justice to it.

Mishra's reference to the source material in the footnotes is again apologetic. Mishra adds: "Cornwallis's hope that the permanent settlement would extend the market for British goods is not of doubtful authenticity." If that is so, why has he not been able to cite even one source for it, although the correctness of his statement has been doubted by me and some other reviewers?

As for the price of the book, it was the printer's mistake to have put it at Rs 55.

Bombay

The Budget and the Crisis

Romesh Thapar

WITH deep resentments building in the urban areas against Charan Singh's tax-collecting effort, it looks very much as if we are moving Indian-style into a new phase of budgeting The current confusion is due largely to the fact that the men who do the fiscal exercises are rooted in the past and are not able to adjust to the new political pressures from the rural areas. Unfortunately, this political dimension of budgeting gets cursory attention in an essentially urban-based press. What we need is a more carefully worked out total picture of budgeting and growth in our conditions.

Even as various groups fight for and against this or that tax, there is unanimity about a commission to investigate government structures and expenditures. Indeed, such a commission should have begun work soon after the arrival of the Janata government. However, in view of the solid neglect of the recommendations of various commissions (including the Jha Committee!), one wonders whether this expensive and time-consuming work should not yield mandatory decisions. If every commission's report is to become the subject of loose debate and controversy, even within the Union Cabinet, there is little chance of a weak government proceeding with any structural change.

Nevertheless, the demoralisation is so widespread that we tend to clutch at any straw. The promised commission becomes a kind of ritualistic exercise to contain angers about the wastage of resources. Any minor probing of government activity or the functioning of autonomous bodies reveals vast and cynical expenditures which could easily be cut. It is now becoming imperative that we force proper accountabilities on our rulers (politicians and bureaucrat-managers, academicians too!) — and not the silly checks that make up scrutiny today.

In the context of the latest budgeting, and the repercussions which will flow from it, there is little doubt that prices and wage structures are going to receive a tremendous shaking. The *status quo* we have been accustomed to cannot hold. Perhaps, we need another commission to highlight some of the truths we refuse to face — that a great deal of new initiatives will have to be taken to tackle the growing problems, *vis-a-vis* wages, of housing, transport, education and health which have been too long neglected. The tax designers will have to widen their vision if they do not want their budgeting to cross points of no-return and spark extensive and determined evasion.

There was a time when a number of *observers played with the idea of detentism* easing the expenditure on the military build-up. Well, with the Chinese thoroughly unpredictable, there seems no chance of any such easing. Actually, the sentiment in the Defence Ministry is very markedly in favour of sparing no effort to keep our armed forces ready for any eventuality, particularly in view of the growth of the *Pakistani military establishment and the renewed support it is receiving from the USA following developments in* Afghanistan and Iran Even if the Chinese are badly mauled in Viet Nam — and this may well happen — these arguments will prevail in Delhi. The 1962 debacle in NEFA casts long shadows.

We will also hear during the next few weeks about the need to tax the "kulak farmer". Without attempting to describe this category, and preferring the mundane description of "rural rich", there is no denying that this segment is preparing to benefit from its suction in government. It would be strange to expect a system which is sensitive to the strivings of the well-to-do in the towns, to espouse the poorest of the poor in the villages. Talk and action seldom fuse in India But, here again, let us not assume that Charan Singh is seen as failing the kisans. Quite the contrary.

The easy effort to squeeze the narrow urban tax base of India to the maximum will create all manner of new and orchestrated pressures designed to restructure the priorities of development. If at the moment there is a simplistic view of what is "luxury", it is because alternative systems have not been worked out. So far, we are content with the old continuities in budgeting and therefore accept the play of lobbies which ask for special or exclusive treatment. The new budget is full of such decoration, and more is on the way before finalisation. Politically, it is going to get more and more difficult to fob off the real and sustained criticism without formulating alternative systems whether they be around housing or transport or education or health.

The drift into an artificial rural-urban confrontation is not imaginary. Editorial comments on the latest budgeting exercise cretainly convey a surprising exasperation against the "pampered" farmers, whatever that might mean. A necessary corrective would be to listen to what the village has to say about *the townsfolk who sit squarely* on the resources of the nation, something which is never recorded. In the weeks ahead, we are going to be at the receiving end of an urban assault on the capers of the peasant politicians. Who in the Janata party will bring matters into better focus?

The defeat of the Jan Sangh/RSS in Uttar Pradesh, following a *rapprochement* between the BLD of Charan Singh and the CFD of Jagjivan Ram, is in many respects a significant development. It has brought a new power alignment into being, and has served to warn the militant RSS cadres to curb their manipulation of the Janata party A low posture by the RSS, and an increasing "collaboration" between the BLD and the CFD, once again gives strength to those trends which are working for a better balance between urban and rural growth. This is apart from the political dividends which accrue from any effort to curb or discipline parochial, communal elements Indeed, if anti RSS sentiment continues to sweep the Janata party, Congressmen of all hues (and Indira Gandhi included!) will find their following in predominant Muslim pockets falling rapidly.

In this connection, it is worth recording that the rowdies who came to shatter the courtroom where Sanjay Gandhi and V C Shukla were tried and condemned as criminals have only helped to highlight the kind of forces which the former Prime Minister represents The lesson may have escaped Sardar Swaran Singh, but a number of his prominent colleagues are wondering who they are "uniting" with.

And, incidentally, what were the police doing during the "popular" demonstration. Even the GOI is silent on this matter.

Industrial Relations Hurdle

Hansavivek

SIEMENS INDIA's operations during 1977-78 suffered a serious setback on account of disturbed labour situation arising out of inter-union rivalry at its works in Bombay. According to chairman, Dharamsey M Khatau, the Kalwe factory was closed for a fortnight in February 1978 because of serious violence inside the factory due to rivalry between the recognised union and the rival union when the latter staked its claim for recognition. The factory reopened on February 20 but about 1,000 workers, that is, 45 per cent of the work-force at Kalwe, did not report for work and resorted to an "illegal" strike (The Worli factory also was affected by the strike from July 1 to September 30, but here again a large number of workers continued to report for work. The management dismissed over 900 workers and suspended 65 on various charges of assault and murder. The strike was ultimately settled with the intervention of the chief minister and labour minister of Maharashtra. The management has withdrawn the dismissal letters and workmen have come to work from November 11. The issue of recognition is to be decided in accordance with law. The factories are now working normally, although tension still prevails.

During 1977-78, the company's sales dropped from previous year's level of Rs 76.13 crores to Rs 71.24 crores and gross profit from Rs 10.11 crores to Rs 7.21 crores, reflecting depletion of margins. The gap in profit has narrowed at the 'net' level because of reduced tax liability. The unchanged dividend of 16 per cent is thus still covered 1.86 times. As at the year-end, pending orders stood at Rs 60 crores, as against Rs 46.6 crores a year ago. The chairman envisages good prospects for the current year. He expects better capacity utilisation not only in the company's works but also in those of its licencees. He estimates this year's sales at around Rs 90 crores. The planned investment programme of Rs 4 crores had to be restricted to Rs 2.6 crores last year due to lower cash flow. The company's future programme includes setting up a factory at Nasik in Maharashtra for manufacture of products for the energy division.

KIRLOSKAR CUMMINS proposes to diversify into manufacture of commercial vehicles including buses and their accessories. It is seeking government permission to acquire a new technology for manufacture of integral buses from NEOPLAN of West Germany. It is intended to manufacture initially a limited number of these buses in order to understand the technical and commercial implications thereof and thereafter to sub-license the technology to manufacture the same to other persons or companies. This will stimulate a greater demand for the company's products. The company's main product at present is the Cummins engine for which it has a licensed capacity of 6,400 numbers per annum and installed capacity of 3,250 numbers. During 1977-78, production of engines was 2,404 units as against 2,389 units of the previous year. Production during the first half of the year suffered severely

due to long strikes in factories of suppliers of castings and electrical components. The company has now started working on the planning process and indigenous development of parts of 'K' engine models, especially for 6 cylinder engine of 600 HP and 12 cylinder V form engine of 1,200 HP. These engines will be useful for dumpers and generating sets. The company has also been permitted to enter into collaboration with Holset Engineering of UK for Manufacture of turbochargers. Despite loss of production, the company's performance last year has been satisfactory with higher sales and profits and slightly improved margins. Dividend stepped up from 10 to 15 per cent is covered 1.15 times by earnings. The management views the current year's outloook with optimism, as the generating set market looks to be more promising. Sales during the first quarter have compared favourably with those of the same period last year.

CRESCENT DYES AND CHEMICALS, a company belonging to the ICI group which recently reduced the non-resident shareholding in its equity from 100 per cent to 40 per cent, has achieved satisfactory results for the year ended September 1978 with sales slightly higher and gross profit a little lower than last year's respective figures. Lower profits are attributed to lower sales of polythene extrusion products and reduced margins in the dyes and textile auxiliaries business. In addition, difficult conditions in the textile mill sector increased the working capital requirements and entailed higher interest charges. Imports from overseas principals were at a satisfactory level because of liberalised licensing. Production at Sewri in Bombay was satisfactory, despite constraints on availability of some important raw materials. Production of polthene extrusion products was affected due to labour problems at Rishra in West Bengal in the early part of the year, but was later stepped up to meet demand. Commenting on the current year's prospects, the directors say that there are signs of revival of the textile industry due to improved cotton crop and multi-fibre policy of the government. The handloom sector, which has received considerable encouragement from government, has [illegible] well and sales to this sector have shown a steady increase. [illegible] of polythene extruded products have been [illegible], but steps have been taken to [illegible] the product-mix in favour of specialised and sophisticated applications with better margins. For future growth a major effort has been launched to identify worthwhile new products which will fulfil existing and new needs of the textile industry. Besides, it is also intended to enter a new manufacturing line.

FIT TIGHT NUTS AND BOLTS is paying 16 per cent dividend on the capital enlarged by a two-for-five bonus issue, as against 19 per cent paid on the old capital. The distribution is thus higher than last years but is still covered nearly 1.3 times by earnings. Both sales and gross profit have been higher, although margins have been reduced on account of rise in costs. The management envisages a bright future for the company. The optimism is based on sizeable expansion programmes undertaken by some of the main customers of the company In addition, efforts are being made to further expand the company's own activities and develop new items.

LOSS PREVENTION ASSOCIATION OF INDIA, an organisation promoted by the General Insurance Corporation of India and its subsidiaries, has been set up to create awareness of the causes and magnitudes of losses and the necessity for their prevention. During the last few months, it has done quite a bit of pioneering work in these fields by holding seminars and exhibitions to spread the message of loss prevention. It has now started publishing a journal 'LPA Newsletter' to cover its activities. It intends to build up loss prevention information and a data bank and to provide knowhow and expertise on the removal and neutralisation of losses LPA operates a fire salvage corps in Bombay and has plans to undertake similar activity in the other major cities of India. It holds courses for people involved in the field of loss prevention with a view to building up a large body of personnel trained in the methodology and techniques of prevention of losses.

INDIAN MACHINE TOOL MANUFACTURERS' ASSOCIATION organised the fourth all-India machine tool exhibition (IMTEX-79) in Bombay in February 1979. Several thousand machine tools, accessories, measuring instruments, testing equipment, cutting and forming tools, welding machines, plastic machines, etc, manufactured by more than 250 companies in India were displayed. Many specially imported sophisticated machine tools and accessories were also demonstrated. The exhibition provided a good opportunity for industrialists, technocrats, engineers and importers to learn of advanced technological developments and to make useful business contacts.

UNIT TRUST OF INDIA has registered a substantial increase in sale of units during July to December last. Sales under unit scheme 1964, children's gift plan and reinvestment plan aggregated to Rs 71.17 crores, exceeding total sales of Rs 70.86 crores recorded during whole of the year ended June 1977. Number of applications under which units have been sold during the first half of the year has gone up to 1.13 lakhs, well exceeding 97,661 applications received during the whole of last year Repurchase of units under 1964 scheme showed a declining trend, aggregating only Rs 2.85 crores as against Rs 4.74 crores in the corresponding period last year. About 12,000 new members have joined the unit linked insurance plan for a target amount of Rs 11.59 crores. In terms of target amount, the growth was 220 per cent over the corresponding period last year The promotional measures undertaken by the Trust in the last 2 years such as house-to-house campaign, appointment of chief representatives in selected districts, intensive publicity, etc have created a growing awareness about units as a sound [illegible] of investment.

PHILIPS INDIA's [illegible] of dilution of non-resident [illegible] under FERA has been approved by the Government of India. The scheme envisages sale of 2,681,600 equity shares of Rs 10 each, now held by N V Philips' Gloeilampen fabrieken, of Holland, and a fresh issue by the company of 1,704,000 new equity shares of Rs 10 each, both at a price of Rs 14 per shares to resident Indians. NVPG will offer 1,629,600 shares to existing Indian shareholders as 'Rights' in the ratio of one share for every 4 shares held and 277,400 shares to employees, directors and business associates of the company Out of the fresh issue of 1,704,000 shares, the company will offer 10 lakh shares to the general public through prospectus. The balance 704,000 new shares, as also 724,600 shares now held by NVPG making a total of 1,428,600, will be offered to financial institutions for meeting convertibility obligations relating to long term loans proposed to be obtained from them. Upon implementation of the dilution scheme, the non-resident equity will be reduced from its present level of 60 per cent to just below 40 per cent. It is the intention to change the name of the company to 'Peico Electronics and Electricals'.

NEW DELHI

Political Economy of the Budget

B M

CHARAN SINGH concluded his budget speech by putting forth a plea for a national consensus behind certain laudable objectives as he saw them and claimed that his budget was a "small step" in that direction. But the reaction to his budget — both on the part of his admirers and critics — has been such that far from promoting a national consensus, it has sharpened the cleavage more than has ever happened in the last three decades. The cleavage is particularly sharp on the question of sharing the burdens and sacrifices, to which Charan Singh made a pointed reference in his budget speech. This is not at all surprising. The most striking feature of the budget is its sectional character and the explicit manner in which Charan Singh, coming back to office as part of a political arrangement within the ruling party, has reinforced his commitment to serve certain easily identifiable sectional interests. The budget is seen by many essentially as a political move on Charan Singh's part and a starting point of the next round of in-fighting in the ruling party. This idea has only gained strength by the parallel that is being drawn with the ministerial crisis which his protege in UP precipitated on the morrow of his joining the government at the Centre.

There are, of course, others who want to steer clear of any political interpretation of the budget and take the stand that however he may have done it, Charan Singh has at least shown boldness and courage in the way he has gone about the difficult business of mobilisation of additional resources without which the prospects for the Sixth Plan would have been bleak indeed. They also argue, as the Deputy Chairman of the Planning Commission has done publicly, that any Finance Minister confronted with this formidable task could not have done anything very different. Somebody other than Charan Singh might have refrained from giving some of the tax concessions on farm inputs but for the rest the tax measures embodied in the budget are not novel at all and carry the spirit of continuity and conventionality about them. This line of argument is only reinforced by the "healthy" reaction of the stock markets to the budget. Business circles and their organisations have, of course, criticised the budget levies. But this is nothing unusual. It is even suggested in some quarters that a convention exists and is scrupulously observed that private businessmen and their organisations should refrain from praising any budget or any other official policy pronouncement lest they lose credibility with popular opinion. It seems to be also found very reassuring, in this context, that Charan Singh now has apparently discarded the notion that large scale industry in public or private sector is antithetical to development of agriculture. On the contrary, he has readily imbibed the advice of his advisers in the Planning Commission and the Finance Ministry that heavy industry has to play a critical role in providing inputs for modern agriculture. He has not, in any case, hesitated in making the required allocations for steel, fertilisers and power. This is seen to have positive implications for industrial development and has been widely appreciated by business circles.

The conventional agriculture-versus-industry debate in determining priorities in the development process has, therefore, lost much of its sting with the first budget of Charan Singh. The real interest now lies in giving a more clear and coherent direction to the concept of modern commercial agriculture which official policy has promoted since the mid-sixties but with a measure of hesitation and also with some reservations so far. What Charan Singh has attempted through his budget is to overcome hesitations and reservations in the pursuit of the so-called new agricultural strategy. His speech at the meeting of the board of directors of the Industrial Development Bank of India a few days after the presentation of the budget was very revealing in this light. The selection of fertilisers, light diesel oil for pump sets and power tillers for tax concessions has a clear logic.

The point to be noted here is that whereas the new agricultural strategy may not have given a higher rate of agricultural growth, it has been eminently successful in creating comfortable market surpluses from agriculture. This has created a paradoxical situation in which the consumption of the poorer sections of the population remains low, stock-piles of foodgrains and sizeable surpluses of other agricultural commodities have emerged. The logical step forward from this position has to be that, instead of carrying the surplus stocks at great cost, Indian agriculture and its further growth should be designed to serve the export market.

There has been a marked hesitation till recently to clearly define this position because it at once arouses the criticism that exports of foodgrains and other agricultural commodities would be at the expense of domestic consumption at a time when there is a large unsatisfied need for these commodities within the country. But a strong lobby in favour of promoting export of farm products has become active in recent months. If immediately after the present Janata government came to power, much ado was made of stopping the export of some commodities, like onions and vegetables, in order to bring down their prices for domestic consumers, especially in the urban areas, the position has now been totally changed. The cry that is being raised is that the fall in the price of agricultural commodities for the producer must be arrested and that for this purpose the government should be willing to export these commodities, if necessary with the help of liberal subsidies on the same principle as apply to non-agricultural exports. The demand for "parity" of prices of farmers' produce with the prices of inputs and other commodities that the farmer buys has been now enlarged to bring within its scope parity of domestic prices of agricultural commodities with prices in the international market. This demand was first made explicit in the charter of the Kisan rally last December and Charan Singh is the most outstanding champion of this demand.

The choice of inputs which have been given tax relief in the budget reveals a logical pattern in this light. The large surplus farmers, whose political spokesman Charan Singh is, are clearly itching to go forward — from a narrow domestic market blighted by poverty and low purchasing power to the wider pastures of profitable export markets. This is the only rationale of the budget proposals and the design of development effort with primacy to agriculture that he has in view.

Waning Developmental Impact of Government Expenditure

Central Budget, 1979-80

THE tax proposals for 1979-80 have been designed, according to the budget speech (Part B), keeping in view three objectives: minimisation of disparities in income; increasing production and avoiding waste by preventing a diversion of resources for wasteful and unproductive uses; and eliminating unemployment and under-employment by stimulating agricultural production by encouraging labour-intensive techniques of production and by improving the competitive capacity of small-scale and cottage industries *vis-a-vis* the large scale industries.

As broad statements of directions which government wishes to pursue in the matter of policy none of these is new. Although couched in different words, these objectives have been adopted ever since the planning commenced in this country. Consistent with the philosophy of the present Finance Minister, however, the role of agriculture and labour-intensive techniques used in the cottage sector has been emphasised and spelt out more explicitly in the 1979-80 budget.

What is striking is the broad-based welcome received by the budget — from business and industry, farmers and a section of intellectuals — despite additional taxation of over Rs 900 crores which it seeks to impose, before allowing tax concessions of the order of Rs 250 crores. Wide ranging excise duties have been justified as moves in the direction of curbing ostentatious consumption of the rich and the affluent urban classes. Differentiation in the rates of excise duties in favour of cottage and small-scale industries has been hailed as the budget's contribution to encouraging labour-intensive techniques of production. Sizeable concessions to farmers have been viewed as steps in the direction of setting right the sectoral imbalances of the past, when the farm sector was allegedly neglected.

While the budget does take steps in all these directions, neither is it a trail-blazer nor does it mark a departure from the past in any significant manner. Excepting the withdrawal of excise duty on unmanufactured tobacco and barring some of the dramatics, such as sanctioning relief of over Rs 300 crores through lowering of duty and enhanced subsidy to the users of fertilisers, the tax proposals are true to the usual pattern. What is more, the impact of the additional resources mobilised by the budget on development would be meagre.

SUPPORT TO AGRICULTURE

Let us begin with the Budget's support to agriculture. While the resources allocated for agriculture, irrigation and rural development have varied from one Five-Year Plan to another, it would be a distortion of facts to argue that agriculture has been a neglected sector in terms of allocation of Plan funds. The performance of the agricultural sector, though not shared equally by different crops, has been reasonably satisfactory in terms of overall growth.

But it is well known that to a large extent the improvement in agricultural output is on account of farmers with large holdings. The benefits of improved techniques of production in agriculture and better inputs, which have been supplied at subsidised rates, have accrued largely to rich farmers.

The skewed distribution of benefits in the agricultural sector, however, is not because the new technology is not viable on small farms. Research has shown that biological/chemical technology is scale-neutral. Therefore, purely in terms of the economics of cultivation, small farms would have benefited from the use of this technology as much as large farms. It is other factors, such as their organisational weakness and lack of credit and of access to the most remunerative markets, etc, which have prevented small farms from reaping the full benefits of the new technology.

In these circumstances, the benefit of subsidised fertilisers will largely accrue to rich farmers. The net income-transfer effects of such subsidies, which are partly financed through taxes on essential and semi-essential commodities and deficit financing, would not result, in reducing disparities in income. Even if some research results indicate that the intensity of fertiliser use varies inversely with the size of holding, reducing the cost of fertilisers is not the best policy alternative, for the following reasons.

First, there is no conclusive evidence to suggest that price of fertiliser is the most important variable determining its usage. Its usage has increased more rapidly when supported by extension effort. Equally important, with regard to the rapid rise in fertiliser usage, factors such as availability of complementary inputs such as water and HYV seeds play a more crucial role than its price.

Secondly, since almost 55 per cent of cropped area is accounted for by holdings in the size-class above 5 hectares (which account for only 10 per cent of the number of holdings), a large part of benefit arising from the reduced cost of fertilisers will accrue to large holdings.

Thirdly, lowering the cost of chemical fertilisers might adversely affect the use and future development of organic fertilisers.

Finally, an across-the-board reduction in the cost of fertilisers on the plea that small farmers will also benefit from it cannot be justified on grounds of interpersonal and intersectoral equity. It amounts to discrimination. For instance, there are certain items, kerosene being the classic example, which are consumed largely by the poor. Applying the same argument as is advanced for fertiliser, on considerations of equity, there should have been a drastic reduction in the duty on kerosene. Instead the budget raises the duty on kerosene to mobilise Rs 36 crores!

In addition to lowering the cost of fertilisers by reducing the duty and providing subsidies, the budget reduces the cost of agricultural inputs through some other measures. Duties on light diesel oil and pipes made of PVC resins (provided these are used for irrigation) are reduced. The primary rate of interest paid by agriculturists in respect of advances refinanced by the ARDC is reduced by 1 to 1.5 per cent. In view of the virtual absence of progressive taxation on agricultural income and property and continued subsidisation of inputs reflected in huge losses incurred, for instance, in respect of water supplied for irrigation, the measures proposed in the budget would improve profitability of agriculture.

Presumably, the budget expects the inducement provided by enhanced profitability to promote agricultural output. The beneficial impact of augmented agricultural operations on employment would thus depend upon the "percolation effect". This effect, the magnitude

Total Plan provision in budget	7281	7431	7108

of which is not known, has to be traded off against the adverse effect on income redistribution. To the extent demand for fertilisers by small farmers is determined largely by non-price factors, both the adverse effects on income distribution and loss of revenue would be deemed avoidable losses.

CONSUMPTION RESTRAINT

Curbing "luxury consumption" and preventing "diversion of resources to wasteful and unproductive uses" is another objective of tax measures incorporated in the budget. Despite this, the provision for conveyance and festival advances for Central government employees has been raised in the budget to Rs 52 crores from Rs 36 crores in the revised estimates for 1978-79! Likewise, allocation is made in the Plan for 1979-80 for expansion of HMT's watch factory. As regards taxes, the total increase in revenue from upper class consumer goods and consumer durables such as cosmetics (Rs 10.9 crores), radio sets (Rs 4.80 crores), refrigerators and air-conditioners (Rs 53 lakhs), chinaware (Rs 41 lakhs), linoleum (Rs 20 lakhs) and stereo systems (Rs 6 lakhs) is too small to make any difference to the pattern of consumption.

The budget speech points out that the bulk of the consumption of petrol is by the upper classes. This is not true. A large proportion of the car population belongs to the government, the public sector and the business class. Either wholly or largely (as allowable expenditure), the cost of running cars would be borne by the exchequer!

In a more basic sense, it would be useful to recognise that an economic system which leaves decisions with regard to production primarily to the market mechanism, the structure of production, distribution of income and allocation of resources are all going to be affected by this choice.

It is useful to bear this central fact in mind while assessing taxation proposals. Acceptance of the fact that some "luxury" consumption (eg, polyester khadi, handicrafts, handmade paper) is inevitable would enable more effective ways of organising production in the small-scale sector and taking steps to augment the market share of this sector. Differential tax rates in favour of the small-scale sector, in a way, are analogous to 'infant industry' protection granted to indigenous industry during the initial years of its growth. As the next step, it might become necessary to protect small-scale industries in a more direct way, as was done through quantitative import restrictions in the case of organised industry. However, if the inefficiencies which now exist in the organised industry are to be avoided, the approach would have to be selective.

Excepting matches and soaps, other indirect tax proposals would not seem to have been designed bearing in mind relative efficiency of different techniques of production. Again, if the objective is to curb consumption of items which are considered "luxury", from the point of view of allocation of resources, production of small TV sets, small refrigerators, small radios, is as much a diversion as is production these items of other sizes. In this respect also the budget does not mark a departure from the past. It seems unlikely that the Budget will make a significant impact on "luxury" consumption. Tax proposals in the budget may best be seen as revenue measures.

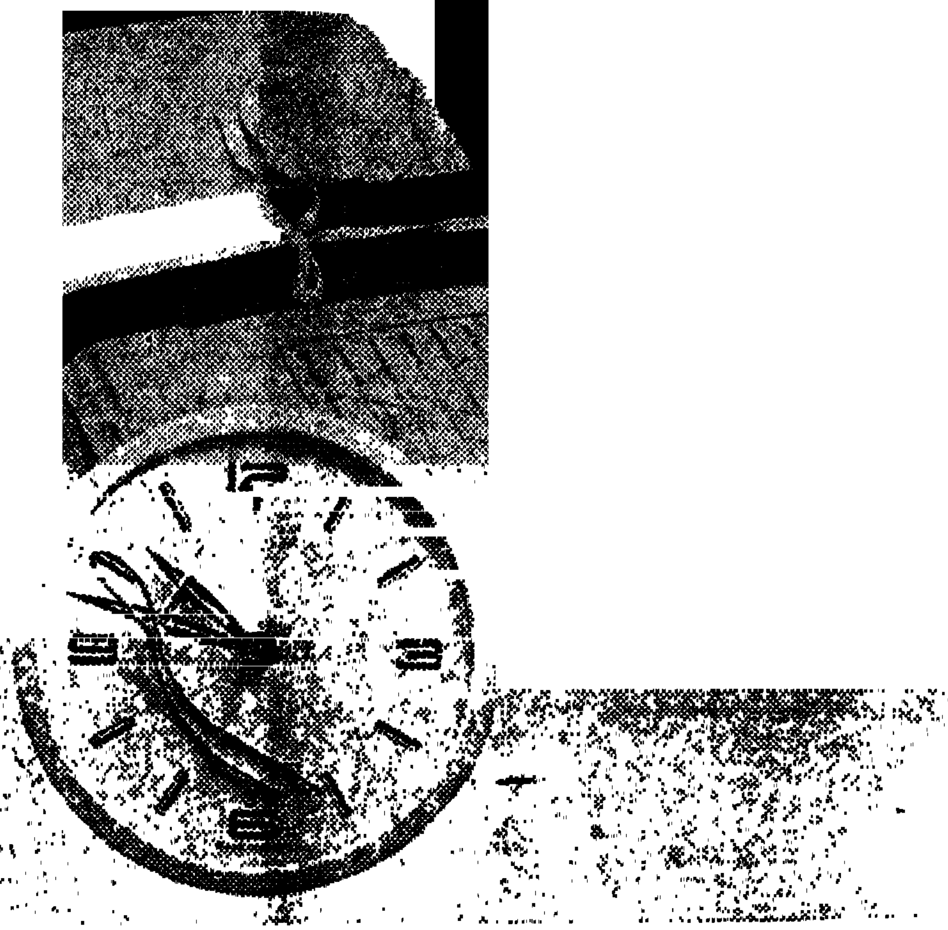

Table 3: Non-Plan Development Expenditure

(Rs crores)

	1978-79		1979-80
	BE	RE	BE

** The amount is understated, as a part of the subsidy was clubbed under 'agriculture' for which separate details are not available.

Resource Mobilisation and Developmental Effort

The budget contemplates additional resource mobilisation through taxation of the order of Rs 665 crores. Despite sizeable additional taxation, there will result a sizeable overall budgetary deficit of the order of Rs 1355 crores. As Table 1 shows, developmental expenditure in 1979-80 would be lower than in 1978-79 (revised estimates). Even after allowing for the effects of transactions with state governments, which are considerably affected by recommendations of the Seventh Finance Commission, the developmental impact of the budget would be disproportionate to the quantum of additional taxation and deficit financing.

During 1979-80 gross (i e, before transfer of states' share) tax revenue is expected to increase by Rs 658 crores (or 6.5 per cent) at existing tax rates. Due to a large increase in states' share following the recommendations of the Seventh Finance Commission, the total tax revenue of the Centre would decline by Rs 160 crores from 1978-79 (revised estimates) notwithstanding additional taxation of Rs 665 crores. The aggregate receipts in 1979-80 are expected to be lower than in 1978-79 (RE) by Rs 403 crores. In addition to devolution of taxes, the absence of capital receipts in the form of "special securities issued to international financial institutions and certain deposits which are not repeated in the 1979-80 budget" accounts for the decline.

Aggregate expenditure would be lower in 1979-80 than in 1978-79 (RE) by Rs 1198 crores — Rs 801 crores under developmental heads and Rs 393 crores under non-developmental heads. Plan expenditure in 1979-80 is expected to be lower than in 1978-79 (RE) by Rs 323 crores. Thus even if one allows for transfer of some developmental expenditure from Plan to non-Plan account as committed expenditure, the fact remains that despite an overall deficit of Rs 1375 crores and additional resource mobilisation of Rs 665 crores, the developmental expenditure in 1979-80 would register a decline. Sector-wise details of developmental expenditure on Plan acount financed out of the budget are furnished in Table 2.

Slippages in Plan outlays should be a matter of serious concern to government. In 1978-79, despite an increase in the revised estimates of overall deficit by Rs 1075 crores and an improvement in total receipts by Rs 238 crores, the total Plan provision in the Central budget (including transfer to states) recorded a rise of only Rs 159 crores. The Central Plan proper (including internal resources) fell short of the budget estimates by Rs 272 crores. Shortfalls in outlay occurred in almost all the sectors. The most significant of these were under industry and minerals.

The widespread shortfalls in Plan outlays would indicate that there are administrative and other limitations in implementing the investment programme. In the case of fertiliser projects shortfalls occurred mainly due to "delay in sanctioning projects" and "slippages" (page 97, Explanatory Memorandum). In the case of Oil and Natural Gas Commission, shortfalls are attributed to "rephasing and postponement" of exploration activities (page 94). Likewise, shortfalls have occurred under programmes such as Small and Marginal Farmers Agencies (page 43) and construction of storage godowns by the Food Corporation of India (page 83).

These shortfalls are in terms of financial outlays. If adjustment is made for rise in the cost of various project inputs, in physical terms shortfalls would be higher than those indicated by financial outlays. The step-up of nearly 19 per cent in the Central Plan outlay (including internal resources) in the budget over the revised estimate of 1978-79 has, therefore, to be seen against these factors.

As brought out in Table 1, while Plan expenditure in 1978-79 fell short of the budget estimates, non-Plan development expenditure exceeded the budget estimates by Rs 1045 crores. Table 3

furnishes sector-wise and purpose-wise details of non-Plan development expenditure. It will be observed that the three major sectors in which non-Plan development expenditure registered significant increase in 1978-79 over the budget estimates are: industry and minerals, general economic services and agriculture and allied services. As can be seen from Table 4, to a large extent, the increased non-Plan developmental expenditure was on account of subsidies and additional assistance to public sector undertakings for meeting cash losses and take overs for which provision is made under each of these heads.

The amounts of subsidies and assistance for cash losses are not exhaustive. Even then, of the increase of Rs 445 crores in non-Plan development expenditure, excluding grants and loans (from Rs 2750 crores to Rs 3195 crores) in the revised estimates, Rs 400 crores is accounted by the increases in subsidies and, assistance for meeting cash losses and takeover of companies. In 1979-80, expenditure under these categories would rise further by Rs 70 crores — a rise of Rs 470 crores over the 1978-79 budget estimates.

Waning Developmental Thrust

Thus the revised estimates for 1978-79 and the budgeted provisions for 1979-80 clearly indicate the intense strain being experienced by government in giving developmental activity a push. The problems have arisen neither because the size of the public sector has reached a saturation point nor on account of taxation having reached unbearable limits. The developmental thrust has been waning since 1966. The reasons for this are the vicissitudes in government policies and lack of clear priorities. The economic consequences of these failures have been two-fold. First, distortions have arisen in the economy. Secondly, the increase in developmental impact from additional resources mobilised for the public sector through taxation and deficit financing has continuously declined. The worsening incremental ratio of developmental impact to additional resources mobilised by government through taxation and deficit financing should receive more attention than it has hitherto. It is in this context that the decision announced in the budget to appoint a commission on government expenditure is a welcome one.

In sum, while the budget for 1979-80 might succeed in stimulating the agricultural sector, its impact on small-scale and cottage sectors and developmental activity in the economy as a whole would be limited. Differential incidence of indirect taxes as a measure of promoting the small-scale sector could be of use only in some cases. Nevertheless, it is to be welcomed. What should cause concern is the waning developmental impact of the budgets. It is in this context that, subsidised supply of inputs and other goods and services needs closer examination.

The 1979-80 budget, by offering sizeable concessions and leaving a huge uncovered deficit would seem to have given a green signal to the states. Taking their cue from the Central budget, not only are state governments vying with one another in conferring reliefs to the already undertaxed agricultural sector but many of them have left uncovered large deficits. Fiscal discipline and integrated national development would seem to be becoming victims of the hardening postures in the matter of Centre-state financial relations.

'Industrial Unrest' : A Case Study

NINE THOUSAND workers of Premier Automobiles (PAL) in Bombay have been without work and wages since December 16, 1978. The suspension of work announced by the management on December 16, 1978 has been followed by a lock-out since January 3, 1979. Also affected as a result are another 12,000 workers employed in ancillary units wholly dependent on PAL.

The present lock-out came within barely eight months of the lock-out of early 1978 that had lasted three-and-a-half months. In the 30-year history of PAL, it is interesting, while the management has declared lock-outs on four occasions, there has not been even a single strike worth the name.

The three units of PAL are located in Bombay-Kurla (7,000 workers), Wadala (1,100 workers) and Kalyan (900 workers). The Association of Engineering Workers (AEW), led by Datta Samant, has been the recognised union at the Kalyan plant for many years. At the Kurla and Wadala plants, the Engineering Mazdoor Sabha (EMS) of R J Mehta and the Premier Automobile Employees Union (PAEU) led by a foreman, S P Galgali, have been functioning for over 20 years. The PAEU has been the management-recognised union since 1968; and in August 1978 it received official recognition from the courts.

A unit of Datta Samant's AEW was formed in the Kurla and Wadala units in September 1978. Within a very short period a majority of the workers appear to have shifted their allegiance to the AEW.

The present lock-out, the management claims, is the outcome of violence by workers of the AEW against those of the PAEU, an illegal strike for three days and a subsequent resort to go-slow from December 1, 1978. Workers of PAL, including activists of both AEW and EMS, do not deny that on November 28, 1978, several supporters of the PAEU had been beaten up; but this was after they had come to know that a fellow-worker and joint secretary of the AEW, Gurunath Varde, had been murdered, allegedly by men of the PAEU. (Galgali and some committee members of the PAEU were arrested for Varde's murder, charged under section 302 and later released on bail.)

According to hundreds of PAL workers and even two former officials of PAL, Datta Samant had not come to PAL to capture the union. He had been brought there on the continued insistence of ex-activists of the EMS and a large number of workers to help them combat the terror and violence against workers allegedly unleashed by PAEU, which has the full support of the management. It has been alleged that there have been innumerable cases of workers being beaten up at their work place during working hours by musclemen of the PAEU without the management taking any action. Moreover, in the past 10 years, nearly 50 activists of the EMS and many other workers are reported to have been suspended or dismissed by the company. Over 100 workers and activists of the EMS and the AEW have also been transferred from departments paying production-based incentive wages to departments where no incentive is paid. It is also alleged that the management-supported union has been extorting money from workers on a variety of pretexts and levying 'service charges' for getting the workers loans from their own Provident Fund Trust.

There has been no wage revision in PAL since 1958, except for a minor one in 1962 on the recommendations of a Board of Conciliation headed by F Jeejeebhoy. PAL workers are paid DA at the rates applicable in the textile industry, which are much lower than the average in the engineering industry. As a result, while workers of Automobile Products of India (API), for instance, are paid DA alone ranging between Rs 640 and Rs 1,000 pm, the total wage of a majority of PAL workers does not exceed Rs 525. Several hundred workers in PAL have not had any wage increment for many years. A large number of workers who have been performing skilled tasks for many years continue to be paid wages applicable to semi-skilled and even unskilled grades. The PAEU, which is supported by the management, has not submitted a single charter of demands in the last 10 years.

One of the major demands put forward by Datta Samant's AEW is that some 100-odd musclemen of the PAEU, who are allegedly not required to do any work and together receive a monthly wage of nearly Rs 2 lakhs, should be required to work the same eight hours as expected of other workers. A simple arithmetical exercise will, however, show the 'wisdom', from the management's point of view, of paying out Rs 2 lakhs every month to some 100 'workers' in this manner. A strong union of workers, by gaining a demand of additional DA of even Rs 100 pm could increase the wage bill on [illegible]

PAL was founded in 1944 and began operations in 1946. Given the close affiliation of the Walchands with the Congress party, an INTUC unit under the leadership of H N Trivedi was formed at PAL and received full management support. However, by late 1947, workers had already turned away from this union and in 1948 they brought in the EMS. The attempt, however, failed, allegedly because of victimisation of a number of committee members of the EMS. A unit of the EMS was formed again in 1951, under the presidentship of Ashok Mehta. In 1953, as a counter to an agitation led by Ram Desai of EMS, a lock-out was declared that lasted three months. Workers finally resumed work without securing their demands. The discontent, therefore, continued. A series of INTUC leaders came and went during this period without succeeding in winning the workers' support.

In 1954, PAL shifted operations from assembly work to production of vehicles. Since it was not possible to raise production significantly in the face of continued resistance by workers, the EMS was given recognition that year. A new problem, however, cropped up. With the closure of General Motors in India in 1954, many of its highly skilled workers were absorbed by PAL when it shifted to manufacture of vehicles. In a large number of cases, these workers were expected to perform highly skilled tasks, but were paid wages applicable to semi-skilled and unskilled grades. The massive growth of discontent and militancy resulting from this and other outstanding grievances made any co-optation of the EMS union impossible. As a result, even as negotiations were in progress on a charter of demands, the EMS was suddenly given notice in April 1958 that it was being derecognised.

A three-day strike in protest against the derecognition became the pretext for the management to declare another lock-out which lasted 110 days. It was in the midst of this lock-out that Galgali's union was born. Years of effort to plant a 'friendly' external INTUC leadership on the workers had failed. So management strategy now shifted to promoting an internal leadership with external support and 'advice'. According to one of the workers, H M patil, who was then vice-president of Galgali's union, all the plans used to be worked out at the residence of the then Labour Minister of Maharashtra, Shantilal Shah. Indravadan Oza, an MLA and a close associate of Shantilal Shah, became the president of the union. G P Galgali, a science graduate

a Sholapur, hometown of Lalchand known to him through the Congress party, took up a job in PAL in 1956. Out of the nearly 500 initial members of this union, 400 allegedly comprised musclemen who were employed in the midst of the lock-out to break the morale of the 5,000 workers. In the next phase of expansion of the company, a majority of the new workers were recruited from Sholapur. For a year or two, Galgali's union expanded rapidly on the strength of the new recruits. But once these workers became permanent and began to experience the same problems as the others, they began to shift their allegiance to the EMS. Quite a number of the 400 musclemen also changed sides. By the end of 1961, the union was reduced to virtual extinction and thus the strategy of promoting a 'pocket' union also failed to work.

After the border war with China in 1962, there was a sharp rise in demand for vehicles for defence and also mounting pressure for increasing the tempo of indigenisation in the automobile industry. For the second time, the EMS was recognised by the management in 1964. However, this did not result in the emergence of a strong and united organisation of PAL workers. Among the factors responsible for this were:

(i) Piece-meal and discriminatory solution to the burning issue of job evaluation and classification. After the 1958 lock-out a Classification Committee had been set up to investigate the matter in detail. While the investigation was still on, in March 1954, R J Mehta withdrew the cases from the Committee and entered into an *ad hoc* arrangement. As a result, evaluation was taken up only for a small section of workers and the basis for evaluation was not only efficiency, but 'approach' or influence as well. A lot of dissatisfaction resulted.

(ii) An incentive scheme which benefited only some workers. An agreement on incentive wages linked to production in excess of agreed norms was arrived at for the truck line in June 1964 and for the passenger car line in 1966. The two agreements gave a massive boost to production. However, whether a worker received 100 per cent incentive wages or none at all depended entirely on where he was located and where he could get himself transferred. As a result, while wages of workers employed in certain departments doubled within a year's time, absence of any agreement on revision of wages and DA rates left a large number of workers exactly where they were for years. The incentive scheme was thus an extremely powerful instrument for favouritism, corruption and victimisation through transfers.

(iii) The slogan of 'production in the interests of the nation' raised by R J Mehta and the EMS. A cartoon in the October 1965 issue of the EMS's *Bulletin* showed a Muslim worker with a bomb in his hand and a communist worker nearby as putting a light to the bomb. 'Patriotic' workers were shown catching hold of these 'enemies of the nation' and throwing them out. Some workers tried to point out that the way R J Mehta defined the 'national interest', it tended to coincide completely with the management's interest and to be contrary to workers' interests. However, workers, influenced by the 'anti-communist', 'anti-Muslim' propaganda, failed to react and this small group of workers paid with their jobs for their opposition.

(iv) R J Mehta's style of functioning. Workers and ex-activists of EMS complain of the increasingly aggressive and authoritarian manner of Mehta's dealings with them. As a result, he alienated himself from a lot of his own activists and a large number of workers.

As a result, Galgali's union returned as a recognised union in 1968, but first under the guise of the Association of Engineering Workers, of the type it then was. Its president was Prabhakar Kunte, an MLA, who had little time for trade union work. With the passing of AEW into the hands of Datta Samant in the early 1970s, Galgali dissociated himself from it, and renamed the union.

When the PAEU launched its offensive against EMS activists and workers, the latter were already disarmed. While the battle was being daily lost within the four walls of PAL, R J Mehta's sole mode of 'fighting' was confined to the court-rooms. The tremendous enthusiasm and morale of the workers today and their respect for Datta Samant derives from the fact that he has supported them in focusing attention back to where the real battle lies — inside the factory premises. The response [illegible] once again to [illegible]

Every major struggle of PAL has had wider ramifications. In 1958 the trade union movement in Bombay observed a one-day 'Bombay bandh' in solidarity with the PAL workers. This time too CITU, AITUC, Sarva Shramik Sangh and some independent unions like the Kamani Employees Union, Mazdoor Congress, the union of taxi-drivers led by Datta Samant and other units of the Association of Engineering Workers have come out in support of the PAL workers' struggle. Out of this demonstration of solidarity has emerged the Workers' Unity Centre, a co-ordinating body of the unions metioned above, in the eastern suburbs of Bombay.

In the past two years, one method after another has been tried by the governments at the Centre and in the states to somehow 'discipline' labour. In Bombay the industrialists' fury seems to be concentrated in particular on Datta Samant, who is portrayed as the person mainly responsible for 'labour violence' and 'union rivalry'. Behind all this can be seen an attempt to weaken the movement of the working class piece-meal. It is crucial that the class closes its ranks to face this challenge. To Workers' Unity Centre is taking shape on such a broad understanding.

In the specific context of the PAL lock-out, the Workers' Unity Centre, along with Datta Samant's union, is demanding a government take-over of Premier Automobile. It has been pointed out that the company has been severely mismanaged. Prices of the company's automobiles have risen by 100 per cent in the past eight years and another price hike is certain after the present lock-out is lifted. Nevertheless, the company continues to run at a loss. In the last 30 years, the company has been able to declare a dividend only three or four times. As it is, 45 per cent of PAL's shares are believed to be held by various public financial institutions and the Lalchand group is reported to hold only 7 per cent of the shares.

SIKKIM

New Chogyals

THERE is irony in the disclosure that the Election Commission has broken with all precedents to order that Sikkimese voters should be equipped with photograph-bearing identity cards. This is apparently a precaution against infiltration, not only from the hill districts of West Bengal but also from Nepal, of villagers who are drawn by tales of the lavish Central largesse that is circulating in Sikkimese hands. According to one report, about a lakh of Nepalese have poured into Sikkim in the last two years.

The irony is that the Chogyal's government repeatedly sought to impose precisely such a restriction. But each time the request was made, the Indian Political Officer in Gangtok reported to New Delhi that the Durbar was only seeking an excuse to penalise — or even disenfranchise — Sikkimese subjects of Nepalese origin. It was an integral feature of India's agitational propaganda campaign aginst the Chogyal not only to dilute Sikkim's demographic composition, but also to encourage ethnic Nepalese to assert their separate language, religion and cultural identity and use these factors as battering rams against the Durbar.

New Delhi's loyal protege in the Himalayan kingdom, Lendhup Dorji Kazi, faithfully picked up the chant and lost no opportunity of denouncing attempts to control entry as communal victimisation. As Chief Minister under the Centre's protective aegis, Kazi now fully endorses the very measures that he condemned for so many years.

His concern is understandable. The passage of the Constitution (45th Amendment) Bill has deprived his government of the additional year of life bestowed on it by Indira Gandhi's indulgent regime. The life of the present Sikkim Assembly, which was elected in 1974 under the shadow of Central Reserve Police guns and while the Chogyal was still formal ruler of the 'Associate State', ends on April 26. Elections should be held soon afterwards; and Kazi is by no means certain of winning them in a fair contest.

Foremost among his worries is the defection of his most able young lieutenant, Nar Bahadur Khatiawada, who now leads the Prajatantra Congress, recognised as the official opposition party with the five MLAs in a 32-member house and enjoying the support of Indira Gandhi's Congress. Another Prajatantra follower, Kusu Das, MLA, recently returned to the Chief Minister's fold when he was promised chairmanship of a committee to investigate Harijan welfare.

Such setbacks notwithstanding, Khatiawada has announced his party's resolve to contest all the 32 seats. The Nepalese community is with him. So are influential Marxist and Gurkha League leaders in Darjeeling and Kalimpong. The group also enjoys the support of a veteran local Nepalese leader, C S Roy, who was the Assembly's first Speaker. More surprisingly it can claim to speak for indigenous Bhutia-Lepchas as well after the induction of Karma Gyampo Lamp who represents Buddhist monasteries.

Trouble is brewing too in Kazi's own camp. His Planning and Development Minister, Ram Chandra Poudyal, was persuaded to withdraw his resignation; but one of the party general secretaries, K M Uprety, has quit. The decision to define Sikkim's 23 per cent Bhutia-Lepcha population as a Scheduled Tribe has not proved universally popular, and the Chief Minister is in danger of alienating leaders of his own community. In a gamble to recoup that loss, two of his nephews, Palden Wangchuck and Norchen Loksam, recently quit the civil service apparently to rally Bhutia-Lepchas to the cause and contest the expected elections.

Patronage plays an even greater role in retaining control. Apart from the eight members of the Cabinet, seven other MLAs are chairmen of committees. With Rs 80.50 crores promised by New Delhi for development plans during 1978-83, there is plenty of inducement all round in a 2,818-square-mile terrain of barely 200,000 people. The cost of each project is grossly inflated, and palms are generously greased all down the line. Lendhup Dorji Kazi, a disgruntled Durbari nobleman, has flamboyantly demonstrated that the most effective way of earning and retaining New Delhi's support is to change sides with each passing wind.

After the Chandigarh session of the Congress party, he pledged wholeheartedly support to Indira Gandhi and merged his Rashtriya Congress with her organisation. But following the 1977 general elections, he became a no less enthusiastic supporter of the Janata party. "We believe in the Election Commissioner's impartiality" says Khatiawada wryly, "but the vested interests are determined to keep Kazi in office". His own Prajatantra Congress now operates within the ambit of the Indian Constitution; but it is not expected to be quite such a pliable instrument in the hands of the Governor, Bipin Behari Lal, who calls all the shots in Sikkim. "We will continue to fight against the colonial attitude of all Indian bureaucrats including the Governor" promises Khatiawada.

His allegation of abuse of power is borne out by the spate of official tours now being undertaken by the Chief Minister who travels with greater panoply than the Chogyal ever did. In slavish imitation of the Palace's now vanished style, he has even bought a Mercedes saloon from the State Trading Corporation and, in flagrant disregard of normal Indian practice, fitted it with a plate reading just 'Sikkim'. He and his ministers have also adopted the Namgyal dynasty's personal coat of arms which was given to an earlier Chogyal by Lord Curzon as part of Queen Victoria's grandiose imperial design.

No one was surprised, therefore, when a Panchayat Sammelan, organised in Gangtok by the administration from February 10 to 12, was suddenly converted into a Janata party meeting. The borderline between party and bureaucracy has altogether been erased.

Sikkimese also complain that the new registration process is biased and that large numbers of voters are deliberately being excluded. About 133,000 voters were listed for the 1975 polls; this year's figure of under 90,000 includes a substantial number of marwari and other plains traders who can be relied on to support the *status quo*. Villagers in the northern Lachen-Lachun areas complain of having to walk ten miles or so to persuade indifferent officials to include their names. The tentative decision to abolish legislative parity is part of the same attempt to disenfranchise those who might be disillusioned with Kazi's rule and vest power in the hands of beneficiaries.

Also suggestive is the move to revive

special representation for the Scheduled Castes. A reserved constituency existed under the Durbar, but it was abolished when Lal (the Governor) and Kazi took over with fulsome promises of an egalitarian ethos in which special protection would no longer be necessary. They are both now convinced that an unpopular ministry needs the additional support of a captive MLA.

The greatest anomaly, however, is in the life-style and methods of legislators, simple villagers who have suddenly been catapulted into power and position. Their frequent extravagant forays into the fleshpots of Calcutta's best hotels reflects the lavishness with which they enjoy themselves in Gangtok. Life in the Palace is modest, even humble, by comparison. Where Sikkim once had only one Chogyal, there are now 32. To be able to dangle before the populance the hope of attaining similar grandeur at the Indian taxpayer's expense is Lendhup Dorji Kazi's most important asset in wooing voters.

BIHAR

'Trade Union' Murders in Dhanbad

Arun Srivastava

THE arrest (and subsequent externment from Dhanbad) of Surajdeo Singh, a Janata MLA, on charges of being involved in a conspiracy to murder three CPI workers as well as in the attempt on the life of S K Rai, AITUC leader and former MLA, has once again brought to the fore the true character of various trade unions in the area.

The new class of labour leaders in Dhanbad include contractors, businessmen and money-lenders too. For instance, along with the Janata MLA, a veteran trade unionist who is a leading businessman and a contractor has also been arrested in connection with the murder conspiracy. Also arrested has been Navrangdeo Singh, a prominent businessman, contractor and a Congress(I) Sevadal leader. Satya Deo Singh, businessman and contractor, the brother of a former Congress minister and presently the vice-president of Janata party of the district and an INTUC leader, has also been served an externment order in this connection.

'Trade union' murders are not unusual in Dhanbad. The violence which is presently institutionalised began in the days of private ownership of coal mines. In order to 'discipline' the labourers who were lured from their villages, the owners always used musclemen, a private militia. While the toughs tamed the labourers, they also took a cut from their meagre wages. The miners were left with no option but to keep on borrowing from the toughs, thus for ever remaining in their clutches.

It was against such practices that a few honest and sincere trade unionists tried to organise the labourers in the early 1920s. But by the 1950s the character of the trade unions had undergone major changes. The leaders, especially those of INTUC unions, established rapport with the pahalwans and entered into an unholy alliance with the owners. A trade union-pahalwan-owner axis began to emerge in the coal belt to control mines, miners and money.

Coal money now began to play a crucial role in politics in Patna and Delhi. A second ranking 'union' leader became as important as the Chief Minister of the state. To this day the practice continues, and it is against the prestige of a Dhanbad leader to camp at the house of a minister in Patna or Delhi; the more proper thing is for the ministers to pay courtesy calls on these leaders.

After nationalisation of coalmines, the axis continued, with the owners being replaced by officers. The pahalwans who after nationalisation were made secure in their jobs now carried out their business openly and vigorously. Within a few months these pahalwans became trade union leaders. As trade union leaders they had at their disposal huge sums of union money and so began business as money-lenders.

The 'original' leaders who began the trade union activities entered bigger spheres by becoming contractors. They utilised their position, their followers — the pahalwans turned 'union' leaders — to obtain more and more business and contract.

Around 1968 a new trade union, Colliery Kamgar Union, led by A K Roy of the Marxist Co-ordination Council (MCC), emerged in the Dhanbad area. Within a very short period of this development, there was unprecedented resistance on the part of the workers which infuriated the professional trade union leaders and gangsters and clashes took place. But these clashes were not a major immediate headache for the Colliery Kamgar Union; the professionals clashed amongst themselves, with the one aim to become kingpin of the mafia.

With the rout of Congress in the last Lok Sabha elections, the entire situation took a new turn. Overnight the pahalwans (who till then were the junior partners of 'original' trade union leaders-cum-political bosses) became ringmasters. Because of his links at the Centre (not to speak of his being a 'co-villager' of Janata chief Chandra Shekhar) the Janata MLA Surajdeo Singh who was once a mere tough and pahalwan of Raniganj Coal Association, became politically very powerful. It is widely believed that he secured the Janata party ticket for the Assembly elections at the behest of a central leader whom he had helped in his Lok Sabha elections by supplying a caravan of cars and huge sums of money. The Bihar Janata Election Committee had to face some protest against his nomination.

To enlarge his operations over the entire coal belt, Surajdeo Singh formed the Janata Majdoor Sangha; with the formation of this organisation, murders in the area became more and more frequent. Even his mentor, B P Sinha, a veteran INTUC leader who originally introduced the practice of 'upgrading' pahalwans to trade union leaders, was not spared. When Sinha was killed by 'some unknown assailants' while having his breakfast with his family members, there was hue and cry in the Assembly and government promised to nab the culprits. Now, in the wake of the attack on S K Rai, police have recovered the number plates of the car used in the Sinha murder and other incriminating articles from the house of the Janata legislator.

Since the murder of Sinha, about nine months ago, nearly 70 prominent labour leaders have been done to death in the Dhanbad area. According to official sources, 24 political murders took place from October 5, 1978 to January 10, 1979. However, the total number of killings including those of workers and followers is put at 400. The latest in the chain has been the murder of three CPI workers.

First Year of Martial Law

THE year 1978 in Pakistan was the year of consolidation for the military regime; of resistance against Martial Law; of disintegration of PNA and the emergence of an embryonic Left alliance.

Consolidation

The Martial Law government set out to consolidate itself, both in the economic and political fronts. The objectives were the revival of the economy through creating the atmosphere for increased investments and to demolish the PPP in such a manner that 'positive results' would be ensured in general elections. On the economic front the year began with a clear indication of support to the capitalist class in the form of a massacre of workers of Colony Textile Mills, Multan, on January 2. An earlier indication had been the Pat Feeder massacre in district Nasirabad, Baluchistan towards the end of December 1977. The earlier denationalisation of flour mills, rice mills and cotton ginning factories was soon combined with a new Presidential Order issued in September 1978 which would enable further denationalisations when and if desired.

On the political front, all forms of legal and administrative persecution have been employed against the PPP leadership in order to defame and discredit the party. These efforts of the Martial Law regime have received the full co-operation of the PNA. On the other hand, the judiciary has also played its role in the consolidation of the regime. Firstly through the agency of the Supreme Court, it extended unconditional support to Martial Law and subsequently through the decision of the Lahore High Court to sentence Bhutto to death in the Nawab Ahmed Khan murder case, it has contributed to the efforts to defame Bhutto. These events were accompanied by the banning of political activities in March and the large scale arrests and floggings of political workers.

Various reasons have been given for continually postponing elections. Firstly it was the need to complete the process of accountability of politicians and the disqualifications related thereto. Then it was the need to revise the electoral rolls and bring them up to date. This was followed by the decision to introduce a separate electorate system for the minority communities which was formally decreed on September 24 through a Presidential amendment.

The absence of any intention by the military regime to relinquish power was clearly indicated by the formation of a 'national government'. This proposal which was much discussed by the various political leaders during the months of April and May in the first instance, took concrete shape in a cabinet composed of generals, technocrats, bureaucrats and Muslim League politicians. This cabinet, announced on the first anniversary of the imposition of Martial Law, soon led to a new cabinet being formed on August 23 which incorporated more politicians of the PNA while allowing the generals to take a back seat.

The disregard of the Constitution has proceeded apace with the consolidation of the regime and with no apparent dissent within the Judiciary. The emphasis on the continued validity of the Constitution has slowly given way to its complete disregard. In the light of this situation, even Chaudhuri Fazal Elahi tendered his resignation as President, and when General Zia-ul-Haq assumed the office of the President on September 16, 1978 his oath of office did not even mention the Constitution.

Elections are not being promised before October 1979; and before that date it is quite likely that the electoral laws will be questioned before the yet to be established Shariat bench as to their validity in Islamic system. This complete process of consolidation, accompanied as it has been by press restrictions and harassment, has still not managed to destroy Bhutto as a political force.

Resistance

The Martial Law regime has faced resistance both from PPP quarters as well as from various independent and basically spontaneous sources. With the continuance in power of the military junta, the PPP has made a number of attempts to exert pressure on the regime through the means of mass agitation against the government. The PPP agitation has, however, remained rather limited and city-based in character. The first phase of agitation encompassed the incident at Qaddafi Stadium, Lahore, involving Begum Bhutto's appearance at the cricket test match on December 16, 1977; the taking out of processions and raising of slogans outside the Lahore High Court by women supporters and the lower rank PPP workers during Bhutto's trial; and the call for 'Democracy Day' to be observed on January 5, 1978. The response of the military regime was large scale arrests and the lashing of political workers. However, even at this time the PPP was not relying on the masses for its support, and attempts to reach an understanding with the Martial Law regime were obvious from the statements of the PPP leadership against any demonstrations outside the Lahore High Court. The PPP efforts were being aimed at various foreign powers and the attempt to mobilise external pressure on the regime.

By March 1978, the first phase of PPP agitation had petered out, but in view of the announcement of Bhutto's death sentence on March 18, a ban on all political activities was imposed in the beginning of March. The announcement of the sentence itself gave rise to renewed agitation on a small scale. Girl students took out processions in violation of Martial Law restrictions. The peak of this agitation was soon reached with the arrest of Retd. General Tikka Khan on March 20 in the Old City area of Lahore. In Sind where the agitation had been more widespread, the movement degenerated into isolated acts of sabotage. During this period, thousands were arrested and the punishment of lashes was employed as an effective deterrent.

The second phase of PPP agitation was based on an attempt to use the religious shrines or mazars as a focal point of agitational activity. This style of agitation soon gave way, however, to the spectacles of attempts at self-immolation that were carried out in a number of towns of the Punjab in September. However, no mass mobilisation of the people took place and the response of the people at large took the form of a passive support for PPP.

In contrast to the lack of active enthusiasm for the PPP attempts at mass agitations, the struggles of students, industrial workers and journalists were much more significant during this period. Workers responded to the Multan Massacre of January 2 by observing January 24 as a black day and February 16 as struggle day. The desire for working class unity in the face of repression was intensified.

Journalists had started a hunger strike to press for the restoration of *Mussawat* (Karachi) in December 1977. This struggle of the newspaper workers and journalists was successful in restoring *Mussawat* (Karachi) but continued press harassment and restrictions led to *Mussawat* (Lahore) ceasing publication. The failure of the negotiations between press workers and the government led to the press workers going on strike in

front of the offices of *Mussawat* (Lahore) from April 30. This agitation continued for a full *month* with daily arrests and resulted in about 200 press workers being arrested. Eventually government was forced to lift the ban on *Mussawat* (Lahore) and release the arrested press workers. However government managed to establish a tout leadership amongst the press workers and journalists which was then credited with the success of the journalists' struggle. Discontent continues amongst the journalists as many have not been reinstated. Further, the punishment of lashes awarded during the agitation to journalists arrested on May 12 has left a deep impression.

Even the workers of Pakistan Television Centre, Lahore, took over the TV studios on February 16. Their rather short-lived protest startled the military regime and resulted in the banning of all trade union activity in the Radio and TV broadcasting corporations.

Student agitation for the postponement of Intermediate examinations, against the denationalisations of educational institutions, agitation by girl students following the Bhutto's death sentence by the Lahore High Court, and most recently, agitation in educational institutions of Sind have taken place during the year. Towards the end of the year, students were demanding the re-opening of educational institutions in Sind. The Islami-Jamiaat-Tulba, ardent supporters of the military regime suffered total defeat in Sind and NWFP in the student union elections of the various colleges and universities. In the Punjab they managed to register some success especially in the city of Lahore.

PNA Disintegration

The situation of the PNA steadily deteriorated over the past year. The Tehrik Istiqlal were the first to desert the ranks of the PNA. For the National Democratic Party, once Wali Khan and the Baluch leaders had been released, it was only a matter of time before the break would come. The common purpose of politically eliminating Bhutto was not enough to keep the PNA together. The Jamiat-Ulema-Pakistan soon came into conflict with the PNA leadership and demanded its resignation. The JUP considered the functioning of the alliance to be undemocratic and demanded that decisions be taken by consensus.

The issue of the formation of a 'National Government' was much debated during [illegible] May and was considered acceptable by the PNA on condition that political activity was restored, that the government formed would be independent and all powerful and that a firm election date was announced. These conditions were put forward by Mufti Mahmood in a letter dated May 27 and sent on behalf of the PNA. The unilateral participation of the Muslim League in the July 5 cabinet violated the PNA stand and threw the alliance into disarray. The Jamaat-Islami put pressure on the other PNA components to join the government, while the NDP moved to formally dissociate itself from the alliance. The eventual participation of the PNA in the August 23 Cabinet came about without the PNA pre-conditions being met. The new Cabinet is not all powerful, its functions relate more to the execution than the formulation of policies and only a partial restoration of political activity was announced while elections were not promised before October 1979. In the longer term, the collaboration of the PNA with the military is likely to be harmful for the PNA popularity and beneficial for the military. In the short term, the PNA components may be able to use their position in government to extend patronage to their supporters. The most recent example of this has been the disbandment of about 1,700 Cement Agencies in December 1978 and the provision of new agencies, particularly to Jamaat-e-Islami supporters.

The image of the PNA has further deteriorated with the split within the Muslim League between a Pagara group and a Chatta group. All the Muslim League ministers in the Cabinet belong to the Chatta group and none of the Muslim Leaguers close to Pir Pagara were taken in the Federal Cabinet.

Left Alliance

In contrast to the growing divisions and disintegration of the right wing PNA alliance, 1978 has seen the emergence of an embryonic Left alliance. The efforts at developing some unity amongst the Left parties and groups appear to have made progress during the year. These positive developments have emerged from a widespread desire amongst left-wing workers and activists to strengthen their co-ordination and co-operation. The trade union movement which has been on the retreat and defensive since a number of years has given rise to sentiments in favour of overcoming local and personal contradictions and forging greater unity. The progressive student movement is managing to link up progressive student organisations from all the four provinces. The need to strengthen the unity of the various nationalities and the importance of the question of nationalities is being given increased attention. Especially in the Punjab, various Left groups are beginning to recognise that this can only be ach[illegible] is the demands for the political [illegible] economic rights of the minority nationalities.

The Awami Jamhoori Ittehad (AJI) is a Left alliance which originally came into existence in April 1977 but was formally established through meetings held during August and September 1978. With a few exceptions, this alliance is composed of those Left groups and factions which have broken away from the original National Awami Party (NAP), at some time or the other in the past. This alliance is unlikely to adopt any militant character and as such few people hold significant expectations concerning its performance. Many of its leaders are opposed to militant struggle and view the alliance as a platform from which to issue political statements and project their own leadership positions.

The Pakistan Awami Tehrik (PAT) which came into existence most recently in December 1978, on the whole has no relationship with those Leftists who emerged from the old NAP. They are more the products of the anti-Ayub agitation and the PPP movement during the end of the 60s and the beginning of the 70s. The PAT is composed of organisations which are more youthful in character, have managed to develop more roots amongst the masses and are representative of more significant elements amongst the progressive forces in the smaller nationalities.

The other expression of developing unity within the Left has been the formation of the Pakistan Progressive Students Alliance (PPSA) which was formally announced on September 24, 1978 in Lahore. The alliance has adopted an 11-point programme on the basis of which it will be encouraging other student organisations to participate and thereby broaden the alliance to encompass progressive student organisations throughout Pakistan.

Conclusion

The year 1978 thus ended with the military junta well established in the seat of government. In spite of this insecurity remains. Its efforts at consolidation appear to revolve around the introduction of an Islamic system. The past month has seen a fanfare of publicity to precede the announcement on the 12th Babbi-ul-Awal (February 10, 1979) of important steps towards the introduction of the Islamic system. With the confirmation of Bhutto's death sentence by the Supreme Court on February 6, these steps may now be overshadowed. The military junta will now feel the need, must as it has felt over the past year, for further consolidation of its own position.

Proposals for a Smaller Public Sector

Anupam Gupta

Direct Taxes: Proposals for Reform edited by O P Vaish and Surekha Panandikar; Vikas Publishing House, New Delhi; pp 117 + xii, Rs 40.

THIS is a publication of the Centre of Fiscal Studies, New Delhi. In this study the authors have analysed taxation and other related matters in India in order to formulate an optimum structure of direct taxes. According to the authors, in India the feasible rate of growth is 8 per cent. A tax structure which makes 8 per cent rate of growth attainable and also simultaneously reduces inequity in the distribution of income is considered as optimal. The justification for the assumption, that 8 per cent is the feasible rate growth, is not available anywhere in this book. The authors prefer an 8 per cent rate of growth, because at this rate of growth the per capita income can be doubled within a period of 12 to 13 years. The authors feel that at a high rate of growth larger employment opportunities could be created and the problem of proverty could be more easily solved. Here the main contention is that the rate of growth can be raised by raising the rate of savings and in order to raise the rate of savings the rates of taxation have to be lowered.

The reader cannot help feeling curious about the repeated assertion of the authors of the feasibility of an 8 per cent rate of growth. If the capital-output ratio is taken as 2.5 — as it has been assumed at two places in this book (p 31 and p 66) — an 8 per cent rate of growth will be possible if the rate of investment is 20 per cent. The "National Accounts Statistics, 1960-61 to 1974-75" published by the CSO shows that the rate of savings in the non-government sector was 12.4 per cent in 1973-74 and 74-75. Direct taxes constituted only 2.73 of national income in 1974-75. The authors firmly believe that this entire tax comes from potential savings. Even if this extreme possibility is assumed to be true, abolition of direct taxes would increase household savings rate to 15.7 per cent. Indirect taxes constituted 11.82 per cent of national income in 1974-75. The Report of the Indirect Taxation Enquiry Committee (1977) shows that 55 per cent of the total indirect taxes in 1973-74 was borne by households below the per capita expenditure level of Rs 100. It cannot be denied that these households have very little scope of making a choice between consumption and saving, and for them the incidence of tax is on consumption and not on savings. In the case of those households who can exercise some choice between consumption and saving, indirect taxation will produce a substitution effect towards savings and against consumption. However, apart from strongly asserting that taxes fall on savings, the authors do not provide any explanation. The authors contend that income earners above Rs 50,000 save 30 per cent of their income. However, the total income of all personal income tax assessees constitutes less than 5 per cent of national income.

In India revenue from indirect taxes has risen at a much faster rate than revenue from direct taxes. Simple exercise with the figures in Tables 4 and 16 of Chapter 2 reveals that, whereas direct taxes as a percentage of national income increased from 2.42 in 1951-52 to 2.73 in 1974-75, the corresponding percentage for indirect taxes rose from 4.99 to 11.82 during the same period. "'The National Accounts Statistics, 1960-61 to 1974-75" shows that the rate of savings was 21.83 per cent in the public sector as against 12.40 per cent in the rest of the economy in 1974-75. So contrary to the views of the authors, it can be held that preponderance of indirect taxes reduced consumption in the economy and diverted resources from sectors with low marginal propensity to save to one having higher marginal propensity to save. This fact is also supported by the findings of the authors: "The index of household savings increased to 1379 (in 1974-75) with 1950-51 as base (= 100), as against an index of 2072 for government savings". The very next paragraph, however, runs as follows:

> If the index of Government savings had increased along with parallel or greater increase in the index of savings for household sector, it would have been most welcome. That this increase in the index of Government savings took place at the cost of increase in household savings, is a matter that deserves serious consideration.

The rationale of this statement is not at all clear. It only indicates the attitude of the authors.

The proposals for reorganisation of taxation form the subject matter of the final chapter. These proposals mainly deal with personal taxes. The authors believe that indirect taxes, although they raise prices, are less harmful than direct taxes because the former, being concealed, are likely to be "painless" and the latter will affect "sensitive economic reflexes" (pp 44, 64). With the help of a peculiar device the authors show that the secrifice of the tax payers in India in terms of tax payment is the highest among a large number of countries. They have measured sacrifice by the ratio of the effective rate of tax to the disposable income per capita. If for UK this ratio is taken to be 100, it becomes 29.3 for USA, but 1109 for India. Does it mean that since the per capita disposable income in India is less than 4 per cent of the per capita disposable income in UK, the effective rate of tax also should be less than 4 per cent of that in UK? If so, then the effective rate of tax in India would be only 1.12 per cent. This same formula has been used in order to derive personal income tax rates at different

TABLE: PER CAPITA PUBLIC EXPENDITURE IN SELECTED COUNTRIES

[illegible] Any formula of equal [illegible] involves assumptions about the utility function of income. Since any assumption about the utility function is not verifiable, there is no justification for putting too much emphasis on a particular formula of sacrifice.

The authors hold that the maximum marginal rate of tax should not exceed 30 per cent because (i) "It is not a matter of coincidence that the rate of growth in the First and Second Plans was relatively higher when the levels of taxation were lower" (p 44) and (ii) a high rate of tax creates strong temptation for tax evasion (p 79). The first statement is not correct. The statutory marginal rate of tax in the highest slab was higher than 90 per cent in 1956-57, and excepting earned income from 1957-58 to 1960-61, the marginal rate of tax on the highest slab was more than 80 per cent during the Second and Third Plan periods. The marginal rate on earned income in the highest slab was 77 per cent from 1957-58 to 1960-61. The authors argue that the temptation for evasion depends upon among other things the subjective judgment of the chance of detection of the taxpayer. According to them if the proportion of income taken out as tax is higher than the proportion left to the assessee after taxation and the chance of detection is low, the assessee will have a strong incentive to evade. Here instead of a reduction in the rate of tax an increase in the chance of detection, say from the assumed 1 per cent to at least 5 per cent seems to be a socially more justifiable remedy.

The authors have suggested abolition of wealth tax because they feel that it is a tax on savings. The concern about the incidence of wealth tax is not so important because its yield constitutes hardly 2.5 per cent of total revenue from direct taxes. The necessity of wealth tax was felt not for the revenue that it might raise but as a measure for checking tax evasion. But the main purpose of wealth tax was defeated when The Direct Taxes Administration Enquiry Committee (1958-59) denied the necessity of a comprehensive return of income, wealth, expenditure and gift proposed by Kaldor in 1956. Due to the absence of a comprehensive return of income and wealth, even today there is no information for studying the relationship between income distribution and wealth distribution in India.

The objective of this book, as it is stated in the preface is to suggest a tax structure that will create scope for maximising the rate of growth and improving the condition of the poor. We [illegible] no obvious reason [illegible] high taxation is reducing [illegible] rate of savings and lowering the rate of growth. Moreover, a smaller public sector will mean smaller per capita expenditure on public utilities. Since the authors have compared the effective rates of tax of different countries, a comparison of per capita expenditure may not be entirely irrelevant. The accompanying Table gives some revealing facts in this respect.

Improvement of standards of education and health of the people is one of the essential ways of ameliorating poverty and reducing inequality in the distribution of economic opportunities among the people. A comparison of our present state with that of some of the advanced countries shows that the Public Sector has yet to take a lot more of responsibility and the relatively well-off have to make more sacrifices for the purpose. However, one would definitely agree with the authors that there is sufficient scope for introducing economy and improving the allocation of resources within the public sector. Moreover, the suggestions that corporate tax should be charged on undistributed profits only, and that fiscal concessions to the corporate sector should be related to labour rather than capital deserve greater attention.

One would wish that there were better editing of a study published by a research organisation. A large number of Tables are given in the text but the sources of the data are not mentioned anywhere. The years of the plans mentioned in the Table on page 5 are wrong. The last year of the annual Plan was 1968-69 and not 1970-71, and the period of the Fourth Plan was from 1969-70 to 1973-74 and not from 1970-71 to 1975-76. Reference to initial depreciation, development rebate and investment allowance should have been made in the discussion of the effect of rising prices on the replacement cost of assets (p 44). The years of the data in Table 3 (p 49) are not mentioned. It is difficult to understand the meaning of annual rate of increase of income of the assessees in an income bracket (p 71). Given the limits of the bracket and the distribution of income within a bracket, the income and the number of assessees will increase at almost the same rate. If the rate of increase of income in the bracket Rs 10,000-Rs 15,000 is higher than that in the bracket Rs 100,001-200,000, it means that the number of assessees in the lower income bracket rises at a higher rate than that in the higher income bracket. Skewness in the distribution of income is the explanation of this very common phenomenon.

Corporate Investment in 1979 : A Forecast

C Rangarajan

An attempt is made in this paper to forecast the behaviour of private corporate investment in 1979. Corporate investment is taken to include gross capital expenditures of all companies including joint sector companies: Government companies alone are excluded. This study also provides a picture of investment behaviour in 1978.

I

Forecasting Technique

THE methodology applied in this paper to forecast corporate investment relies on the data available with the term lending institutions on the phasing of capital expenditures of projects sanctioned by them. These may be regarded as a kind of anticipatory data for forecasting. The details of the technique followed have been explained by the present author in his earlier writings.[1]

It has been observed that most projects in the corporate sector approach one or the other of all-India term lending institutions for obtaining the necessary financial assistance. The companies provide the lending institutions with data not only on the total cost of the project but also the capital expenditures (project as well as normal) to be incurred in the various years. This information forms part of the cash flow statements attached to the proposals. By aggregating the information on the phasing of capital expenditures of proposals sanctioned in all the previous years, it should be possible to forecast capital expenditures for any year. The scope of the study is strictly restricted to the enterprises which have taken assistance from the term lending institutions. Thus, obviously the estimates arrived at do not cover the entire corporate sector. Nevertheless, since most of the companies come to the financial institutions for assistance, this estimate can be regarded as a reliable reflection of the behaviour of the entire corporate sector. What is relevant from the point of the corporate sector as a whole is the trend revealed in the rate of change rather than the absolute figures.

The estimates that are derived approximate more closely to the gross fixed asset formation than to net fixed asset formation. In the case of new companies there is no difference between gross and net fixed assets. But with respect to old companies the cash flow statements provided to the financing institutions relate to the entire company. Therefore, as mentioned previously, we take down not only the capital expenditures on projects but also the normal capital expenditures which are shown in the cash flow statements. In the last few years we have taken extra care to collect data on both types of capital expenditures. But we have faced some difficulties in this regard. There are some companies which have not provided data on normal capital expenditures. In the case of certain types of loans such as those for balancing equipment, detailed data are not usually provided.

A limitation of this method of forecasting is that part of the expenditures to be incurred in any year comes out of projects sanctioned in that very year itself and we have no information on this. The proportion of such expenditures has varied from year to year. In 1973, 1974 and 1976 the ratio was around 30 per cent. There was a sharp jump in the ratio to 45 per cent in 1977, which may perhaps be accounted for by the introduction of new schemes such as soft loan schemes and technical development fund schemes. Expenditures on projects coming under such schemes may not have much lag. This ratio has dropped to 28 per cent in 1978. Thus a part of the capital expenditures to be incurred in a year will largely depend upon the factors that operate within that year and these cannot be forecast by our model. While the pending applications with the term lending institutions can give some clue, they do not provide a satisfactory indicator. However, this method at least indicates the minimum investment that will be made. Also it indicates the expenditures that will have to be forthcoming out of the investment decisions of the forecast year in order to show a rise.

The other limitations of this model of forecasting have been pointed out by the author in his earlier writings. The validity of the estimates depends upon how closely companies adhere to the expenditure pattern outlined in the initial project proposal. Cost over-run of projects by itself is not a limitation. So long as, companies seek assistance from the term lending institutions for financing the cost over-run, they would get incorporated in our estimates. In the case of such projects necessary adjustments are also made in the phasing of capital expenditures in the light of the new information. Obviously companies which finance the over-run out of their resources will not be captured in our estimates. However, the crux of the problem is how closely even under normal circumstances companies stick to their original phasing of capital expenditures. We made an analysis of 44 projects comparing the original and the actual phasing of capital expenditures. It is difficult to draw any generalisations from this study. The one factor that emerges is that in the case of expenditures to be incurred in the year of sanction, planned expenditures are always higher than the actuals. It appears that normally projects provide for about 20 per cent of the cost of the projects to be incurred in the year of sanction. But the actuals are much closer to 10 per cent There is some evidence to believe that the original and the actual phasing of capital expenditures are much closer for existing companies than for new companies. To some extent differences are also accounted for by the nature of the industries. Actual expenditures will perhaps be close to the planned ones in the case of loans granted under such schemes as soft loan schemes and technical development funds. The composition of the projects in terms of old and new companies, types of industries and types of loans vary from year to year. There is no general formula by which one can modify the original phasing of capital expenditures. We have to be content with making changes in the original phasing of capital expenditures as and when new information is made available to the financing institutions. However, some judgment will have to be exercised in relation to

planned expenditures to be incurred in the year of sanction.

Forecasts of corporate investment using this model have been made in the past several years. However, one is naturally tempted to ask how far these forecasts compare with actuals. It is rather unfortunate that we do not have a series on corporate fixed investment which is reliable and acceptable to all. At present estimates are provided by the CSO, the *Economic Times* and to some extent by the Reserve Bank of India. An analysis of these estimates indicates that they differ from one another not only in absolute amount but also in terms of relative changes for several years. Though all the estimating agencies use the method of blowing up the figure obtained from a sample survey of companies, differences seem to arise because of lack of reliable data on the total paid up capital of all companies industrywise.[8] For 1972-73, 1973-74 and 1974-75 the *Economic Times* estimates of gross fixed assets formation of the corporate sector show a rise of 42.4 per cent, 6.5 per cent and 82.8 per cent, respectively. The corresponding rates of growth according to the CSO estimates which include co-operatives also are 31.4 per cent, 7.3 per cent and 16.4 per cent, respectively. Our final estimates showed a rise of 45.3 per cent, 14.7 per cent and 28.5 per cent, respectively. The substantial increases in gross fixed investment at least in nominal terms witnessed in 1972-73 and 1974-75 were captured by our forecast. For 1975-76 our forecast showed a fall whereas all other estimates showed a rise. Data since 1976-77 from RBI and CSO are yet to come.

II

Picture for 1978

Table 1 provides the data on the phasing of capital expenditures of projects sanctioned by the three major term lending institutions — IDBI, ICICI and IFCI.[8] Read horizontally, each row shows the expenditures to be incurred in the various years by companies whose projetcs were approved in a particular year. These include normal as well as project capital expenditures in the case of old companies and project expenditures in the case of new companies. Read vertically, each element indicates expenditures to be incurred in a year out of projects sanctioned in a previous year. The total of each vertical column indicates the expenditures to be incurred in a particular year out of projects sanctioned in all the years.

From Table 1 it can be noticed that the capital expenditures in 1978 will be Rs 1,014 crores as against Rs [illegible] crores estimated at this point for 1977. This would imply a growth rate of six per cent. It may, however, be noted that the estimates for 1977 as of now is Rs 1,011 crores. This includes Rs 56 crores spent in 1977 on projects sanctioned in 1978. The estimates for 1978 would also go up by a more or less similar amount when the projects sanctioned in 1979 are known. Therefore one can conclude that corporate investment in 1978 rose by six per cent over the level reached in 1977. This also confirms the forecast made last year of a rise between five per cent and eight per cent.

All the capital expenditures indicated are in current prices. The cost estimates of projects sanctioned in any year would be at the price level of that year. Thus, while aggregating the estimates of projects sanctioned in the previous years, there is need to reduce all the figures to a common price level. We have deflated all the elements in the columns by the combined price index of electrical machinery, non-electrical machinery and transport equipment with 1960-61 as 100. It is seen that the total capital expenditures for 1975, 1976 and 1977 would be Rs 244 crores, Rs 292 crores and Rs 408 crores, respectively. The total capital expenditures for 1978 in real terms will also show a rise of six per cent over the level achieved in 1977.

The estimates provided are based on projects approved by the all-India institutions. There are cases where the financing of projects even in the corporate sector is done by state-level term lending institutions. However, we have found it difficult to collect at this point detailed data on such projects. Also there are other facilities such as the bill rediscounting scheme of IDBI which also finance capital expenditures. The total amount disbursed by IDBI during 1977-78 under the scheme of rediscounting of bills came to Rs 100 crores.

TABLE 3: INDUSTRYWISE TOTAL CAPITAL COST AND PHASING OF CAPITAL EXPENDITURE ON PROJECTS SANCTIONED BY IDBI AND ICICI DURING 1978

(Rupees in crores)

Industry	Total Project Cost	Years					Number of Projects	Completion Expected in			
		1977	1978	1979	1980	1981 and Onwards		Same Year	Next Year	Year After	Four or More Years
Automobile and cycles	12.45 (1.13)	—	1.83	5.70	4.47	0.45	6	2	2	1	1
Cement	88.04 (8.00)	2 90	11.68	16.63	29.78	27.05	6	1	2	2	1
Chemicals and Petrochemicals (except fertilisers and pesticides)	70.25 (6.38)	5.68	17.45	37.11	10.01	—	27	11	12	4	—
Electrical equipment	25.17 (2.29)	0.56	7.77	10.30	6.52	0.02	20	3	12	4	1
Electricity, gas and steam	303.40 (27.56)	—	28.63	75.70	118.61	80.46	3	—	—	1	2
Fertilisers and pesticides	17.74 (1.61)	1.26	2.00	4.98	2 00	7.50	6	—	4	1	1
Food products (other than sugar)	3.06 (0.28)	—	1.59	—	0.47	1.00	3	2	—	—	1
Glass, pottery, etc	25.21 (2.29)	3.10	5.78	12.00	4.33		5	—	2	3	—

Miscellaneous	9.31 (0.84)	0.88	5.28	2.30	0 70	0.15	13	3	7	2	1
Total	1100.84	38.67	224.31	379.93	276.62	181.31	271	58	138	56	19

Note : Figures in brackets are percentages of total.

III

Pattern of Capital Expenditure in 1978

Table 2 provides an industrywise break-up of the capital expenditures incurred in 1978. 'Chemicals' and 'pharmaceuticals' (including fertilisers and pesticides) have topped the list with 19 per cent of the total capital expenditures. 'Paper' ranks second with 14 cent of the total capital expenditures. 'Textiles' and 'cement' account for a slightly larger proportion of the total expenditures in 1978 than in 1977.

Table 3 indicates an industrywise analysis of the projects sanctioned in 1978. It shows where the new projects are being set up. The total number of projects approved in 1978 was 271 as compared with 302 during 1977. In the previous year there was a sharp rise in the number of relatively small loans granted. During 1978 there were 78 soft loans and about 30 TDF projects. The total cost of projects sanctioned in 1978 came to Rs 1,100 crores which is more or less equal to the total cost of projects sanctioned in 1977. In the previous year, 18 joint sector projects including a giant fertiliser project accounted for 33 per cent of the total cost of the projects. But during 1978 the joint sector projects contributed only seven per cent of the total cost. The total cost of the projects coming under the soft loan scheme was Rs 183 crores.

There is also a marked difference in the composition of industries assisted during the current year as compared with previous year. The two major industrial sectors in which new projects were being initiated in 1977 were fertilisers and pulp and paper. During 1978 electricity generation is the major sector accounting for 28 per cent of the total cost of the projects initiated. Next comes metal and metal products with 22 per cent; textiles account for 19 per cent and cement 8 per cent.

There were seven projects sanctioned during 1978 with a capital cost of more than Rs 20 crores each. These seven projects include projects in electricity generation, steel expansion and cement production. These projects accounted for 55 per cent of the total cost of the projects.

IV

Forecast for 1979

As of now, based on the projects sanctioned until the end of 1978, the capital expenditures in 1979 will be Rs 747 crores. Thus there is a gap of Rs 268 crores to be filled in to come up to the level of 1978. Since normally the capital expenditures to be incurred in a year out of the projects sanctioned in that year itself does not exceed Rs 250 crores, it is unlikely that the corporate investment in 1979 will exceed the level reached in 1978. Of course, there is an exception when in 1977 there was a very substantial amount of capital expenditures incurred in that year flowing out of projects sanctioned in that year. But this is an exception rather than the rule. Therefore, based on past general behaviour, it is hard to expect more than Rs 270 crores of capital expenditures in 1979 out of the projects to be sanctioned in that year. Therefore our conclusion is that corporate investment in 1979 will stay at the level reached in 1978.

Notes

[The author wishes to thank the authorities of the Industrial Development Bank of India, the Industrial Credit and Investment Corporation of India and the Industrial Finance Corporation of India for the co-operation extended to this study. The author also wishes to thank Ranjana Pendharkar for the valuable assistance rendered by her in collecting and analysing the data. The author is grateful to the Director and the Research Committee of the Indian Institute of Management, Ahmedabad for providing financial assistance for the project.]

"Private Corporate Investment in 1978: A Forecast", *Economic and Political Weekly*, March 11, 1978.

2 For a discussion on this, see C Rangarajan and Kirit Patel, "On Constructing a New Series on Corporate Fixed Investment", Paper presented at the Annual Conference of the Association for Research in National Income and Wealth, January 1979.

3 For 1977 we have not been able to collect all data from all the term lending institutions. The data on projects sanctioned exclusively by IFCI remain to be collected. Since this is usually a small figure this should not affect the conclusions drawn.

Kirloskar Brothers

KIRLOSKAR BROTHERS has fared so well during 1978 that the board, known for its conservative distribution policy, has stepped up dividend from 6 per cent to 12 per cent. This is subject to the approval of the financial institutions, although it enjoys a more than twofold earnings cover. Demand for the company's products, continues to be satisfactory and the management expects that the current year will prove even more profitable. Shortage of raw material, however, is causing some anxiety. The company intends to replace the existing old plant in the foundry at Kirloskarvadi and has approached ICICI, IDBI and IFCI, who have together sanctioned a soft loan of Rs. 96 lakhs. The balance requirement of Rs 24 lakhs will be met from the recent rights issue of equity shares made in the proportion 1:2. The company is participating in a new joint venture in association with Sigmund Pulsometer Pumps of UK who has been acting as sole distributor for the company for UK and Western Europe. SPP has now proposed that a separate marketing company be formed under the name 'SPP International' for handling the sale of certain types of pumps manufactured by the company and certain other products developed with the help of SPP and manufactured by the company. SPP has offered a part of the equity capital of SPPI to the company. By accepting the offer, the company will be able to share in the profits of the trading activity. During 1977-78, the company invested Mauritian Rs 84,000 in the equity shares of Hydrodyne, Mauritius, by supply of machinery and equipment of that value which represents 70 per cent of the equity capital of that company which has thus become its subsidiary. Sale or pumps manufactured by Hydrodyne will commence during the current year. The Company has received government's approval for equity participation in Kirloskar Kenya, a trading joint venture in Kenya.

Bonded Labour and Illicit Money-lending in Maharashtra

Review of a Report

S D Kulkarni

Though spokesmen for the Government of Maharashtra have more than once officially denied on the floor of the state assembly that the system of bonded labour does not exist in Maharashtra in any form, it is a well-known fact that the practice of bonded labour does exist in the State; and accounts of the practice, supported by unimpeachable data, have also been published. That the government itself was not quite convinced of its denials of the practice was evident in the appointment of a Committee by the state government to examine the problem of illicit money-lending in the state, but which was also asked "to investigate whether the system of bonded labour still exists in the state... and to suggest ways and means to eradicate the system".

This article briefly examines the background to the appointment of this Committee and presents a critical summary of its findings.

THE British practice of appointing a Committee whenever a complex problem that evades simple solution arises continues in independent India. Committees are being appointed on so large a scale that even those who appoint them appear to forget their work. Committee Reports have proved to be a mine of data for researchers. One has only to glance at the recently published annotated bibliography of the economic history of India to see the range and depth of variety of subjects covered by these Committee Reports.[1]

Of course, not all the Committee Reports can be equally good. Some are good, some are not so good while some are not at all good. The Report of the Committee appointed by the Government of Maharashtra on Problems of Illicit Money-lending and Bonded Labour would come under the last category.

The Background

First, the background to the appointment of this Committee. The issue of bonded labour came into limelight during Emergency; the fourth point of the 20-Point Programme declared that "bonded labour, wherever it exists, will be declared illegal".

To implement this part of the programme, the Government of India issued the Bonded Labour System (Abolition) Ordinance on October 24, 1975. It was later on passed as an Act (19 of 1976). The Act defined the system of bonded labour in a very exhaustive manner. Two main characteristics of bonded labour were cited as (1) the loss of freedom to work in consideration of an advance or social obligation; and (2) work on wage rate lower than the one prevailing in the market in consideration of the loan and interest. The definition of bonded labour also covered the forfeiture of the debtor's right to sell at market value any property or the product of his labour. This brought the system of *palemod* (agreement to sell standing crops against a loan) prevalent in Maharashtra under the term of bonded labour. The Act declared the system of bonded labour as illegal and discharged all bonded labourers from any obligation to render labour. It also extinguished their liability to repay debts. Any creditor who accepted any payment against any bonded debt was made liable to imprisonment upto three years and fine. The Act also made provision for the constitution of vigilance committees to look after the implementation of its provisions.

After the declaration of the 20-point programme, several governments published reports on its implementation. The Government of Maharashtra simply denied the existence of the system of bonded labour in the State and evaded the entire issue. Several reports of the Commissioner for the Scheduled Castes and the Scheduled Tribes had pointed out the prevalence of the system in Maharashtra.[2] In spite of this evidence, the then Finance Minister, Y J Mohite, in his budget speech before the Legislative Assembly, said that "The bonded labour system is not prevalent in Maharashtra. However, to make sure that such labour in any form does not exist in the state, enquiries are being made through the Tribal Commissioner and the Director of Social Welfare".[3] Similar statements were made by other ministers in the Legislature and outside. It is surprising that neither the government nor any member of the Legislature was aware of the statements made in the Reports of the SC and ST Commissioner. This attitude of the government came in the way of the eradication of the system. It is pointed out in the Report under review that "the Government of Maharashtra had denied that bonded labour system existed in Maharashtra in any form. As such the state government did not make any efforts to conduct any survey to ascertain the actual position in this regard, nor any other social service or research organisation made any investigation into this problem" (pp 20-21).

Certain newspapers, however, reported cases of bonded labour in different areas of the state. Bhoomi Sena, an organisation of Adivasis in Palghar tahsil, conducted a survey of bonded labourers in 20 villages and found 261 identifiable cases of bonded labour.[4] It submitted more than 100 applications of bonded labourers for discharge from the bondage.

The state government, while considering the recommendations of the Shivaraman Committee on consumption credit, decided to appoint a Committee to examine the problem of illicit money-lending in the State. This Committee was also asked "to investigate whether the system of bonded labour still exists in this state and, if so, in what form, and to examine the circumstances leading to the system of bonded labour and to suggest ways and means to eradicate this system".[5] The Committee was asked to submit its report within three months. This period was extended to May 31, 1977 and was further extended to October 31, 1977. The Committee submitted its report in October 1977 that is nearly one year after its appointment. Summaries of

the Report, [illegible] is November, 1977.

The Report

The Report is divided into five chapters. The first chapter gives general information on the composition and the working of the Committee. The second chapter gives the background of the bonded labour system and legal measures taken to eradicate it. The third chapter describes the practices of bonded labour in Maharashtra. The fourth chapter is about the practices of illicit money-lending while the fifth gives a summary of conclusions and the recommendations made by the Committee.

The Committee traces the origin of the bonded labour system "to caste hierarchy and feudal structure". It points out that the victims of the bonded labour system are "found largely among adivasis, scheduled castes and other economically weaker sections of the society". The statements are general and vague. It would have been better if the Committee had noted the role of some laws introduced under British rule in creating the system of bonded labour.

Following the directive given by the British Parliament in 1833 (3 and 4 William IV, Cap 85, 1833) the Government of India passed an Act to abolish slavery in 1843 (Act 5 of 1843). Bonded labour system came into existence after the abolition of slavery. Some of the laws helped to create the system of bonded labour. An Act to provide for the breaches of contract by artificers, workers and labourers in certain cases (Act 13 of 1859) made the breach of contract for service after receiving an advance a criminal offence punishable with imprisonment. Landlords, merchants and master craftsmen took advantage of this Act and held labourers in virtual bondage under the threat of imprisonment. Another Act passed in the same year, the Civil Procedure Code, had also the same effect. Section 200 of the Code made provision for the execution of decree by attachment of property or by imprisonment of the party against whom the decree is made. Landlords and money-lenders used this provision to hold labourers in bondage.[8] The Act to provide for the breaches of contract was repealed in part in 1874 and altogether in 1925. Section 200 of the Civil Procedure Code was amended by the Deccan Agriculturists Relief Act of 1879.

The Committee should have also noted the laws made to abolish bonded labour system in other states. The Government of Bihar and [illegible] the Bihar and Orissa Kam[illegible] of in 1920 and prohibited all agreements to work in return for advances and loans or payment of interest. The Government of Orissa promulgated the Orissa Bondage Abolition Regulation Act in 1948 to abolish the system of *gothi* prevalent in the state. The Government of Rajasthan passed the Rajasthan Sagri System Abolition Act in 1961 to abolish the system of bonded labour in the state. All these Acts achieved only a partial success. The Committee should have tried to examine the provisions and effects of these Acts.

The Committee has also failed to take notice of an important provision of an Act of the state of Maharashtra that deals with bonded labour agreements. The Government of Maharashtra promulgated the Maharashtra Debt Relief Ordinance on August 22, 1975. Section 4 of this Ordinance declared that "any custom or tradition or any agreement (whether made before or after the appointed day), whereunder or by virtue of which a debtor or any member of his family is required to work as labourer or otherwise for the creditor shall be void and of no effect and shall never be enforceable in any Civil Court" (Ordinance 7 of 1975). The Ordinance with some changes was passed as an Act (3 of 1976). The Government was empowered to extend the two year period of the operation of the Act by another Act in 1977 (40 of 1977). The omission to mention this provision is very surprising and shows gross carelessness.

The third chapter tries to describe the system of bonded labour in Maharashtra. We have already pointed out that the Committee mentions that neither the government nor the social service or research organisations made any investigation into this problem. This does not speak well of the research institutions, some of whom claim international reputation, and also of the government departments. One wonders why the government sponsored Tribal Research and Training Institute also did nothing in this matter.

The Committee also failed to do much in the matter. It relied mainly on visits to certain areas and has recorded their impressions in the Report. The chapter, therefore, reads like the description of a tour rather than a Committee Report. The Committee refers to two articles in Marathi weeklies. One of these is the article in *Manus* referred to above. It is surprising that the Committee did not find it necessary to make inquiries in Palghar tahsil where over a hundred cases of bonded labourers were reported.

The Report mentions that the Committee in its meeting at Thane was informed by the Labour Officer that 891 complaints regarding bonded labour were received from the area and that 459 persons were freed from bondage. One wishes that it had given some details of the cases that could not be settled and the bonded persons freed. It appears from the Report that the government had appointed Vigilance Committees under the Bonded Labour System (Abolition) Act. Were the complaints referred to these committees and, if so, what were the steps taken by them in different districts?

The experience of Bhoomi Sena workers who submitted several petitions of bonded labourers to Palghar talsil office is that in many cases the papers were sent to the village *talathi* (circle inspector) who called the bonded labourer and told him that he was free to work anywhere. The message was also conveyed to the employers. At no time any inquiry was made by any member of the Vigilance Committee at the district level.

The Report describes different forms of bonded labour in different districts. The system of *lagna-gadis* (marriage debt labourer) is prevalent in Thana and Nasik districts. Under the *lamzana* system among the tribals in Amravati district, the bridegroom who cannot pay the bride-price works in the house of the bride's father for a stipulated period. This is a sort of bonded labour but it cannot be dealt with by law. The Committee notes that lack of adequate employment is the root cause of the bonded labour system. It is a general notion that the employers give work to bonded labourers all the year. This is not always the case. In lean season when the employer cannot provide work to the bonded labourers he asks them to seek work elsewhere and does not pay them the stipulated wage in cash or kind for these days. In some cases, when the labourers work under the Employment Guarantee Scheme, the earnings are handed over to the employer in exchange of customary wage (p 44). The Committee has come to the conclusion that "bonded labour system in various forms exists in Maharashtra, specially in adivasi areas of the state".

The Committee has also referred to the system of forced labour. Under this system labour is rendered not in return of any consideration but under certain customary social obligations. The Tata Institute of Social Sciences conducted a survey of bonded labour in

three tahsils of Chandrapur district and Thane district each. This Report of this survey is presented as Annexure III to the Report under review. The Report gives some cases of forced labour. In some forest villages forest guards force tribals to work on job without any payment. In some cases if a husband is given a job in the forest the wife is supposed to give free labour (p 96). In some cases small farmers have to keep aside their work and work for some big farmers on nominal wages. Refusal to do such work results in serious beating (p 99).

The fourth chapter describes different practices of money-lending prevalent in the state. The chapter also describes the provisions of laws controlling money-lending in the state. The Maharashtra Debt Relief Act (3 of 1976) is referred to in this Chapter. As stated earlier there is no mention of the provision that prohibits bonded labour. One wishes that the Committee was more careful and precise in its mentioning of the title of the Act and in its references to it. According to the Committee, "the Government of Maharashtra passed the Debt Relief Act of 1975 which came into force on 22-8-1975" (p 50). In fact it was not the Act but the Ordinance that came into force on August 22, 1975. The Ordinance was later passed as an Act. And the correct title of the Act is not the 'Debt Relief Act of 1975' but 'the Maharashtra Debt Relief Act of 1976' (3 of 1976). Such mistakes should not be made in a Committee Report that is likely to be read and referred to for a number of years.

The government made certain amendments in the Bombay Money-lenders Act of 1946 (31 of 1947) by passing the Bombay Money-lenders (Amendment) Act, 1975 (76 of 1975). The amendments came into force on July 29, 1976. These amendments are described in the chapter.

The fifth chapter gives the conclusions and recommendations. The Committee has rightly pointed out that bonded labour and illicit money-lending are the results of extreme poverty and can be eradicated by "improving economic, cultural, religious and social conditions of the weaker sections of the community" (p 72). One fails to understand what the Committee means by improving the 'religious' conditions of the weaker sections of the community. Does it mean conversion to some religion? The Committee "recommends that district-wise surveys should be undertaken by the Social Welfare Department of the state government or by the Tribal Research Training Institute, Pune or by recognised social service organisations working for the benefit of backward class communities, to identify bonded labourers in each district" (p 72). The recommendation is very good. But what is a 'recognised' social service organisation? What note has been taken of surveys made by organisations like Bhoomi Sena? The Committee has also recommended a time bound programme for the spread of literacy and education in the tribal and backward areas on a priority basis. The Committee has also recommended a provision of guaranteed employment to every able-bodied person. It recommends a total ban on money-lending in tribal and backward areas. It also recommends a ban on private trading in foodgrains in tribal and other backward areas.

Some Conclusions

One feels that the Committee should have recommended that the bonded labour contracts should not only be declared void but should be made punishable.

In brief, the Committee has done a bad job of a good undertaking. The Report is full of mis-statements and inaccuracies. The Committee is not clear as to what bonded labour is. For example, in the chapter on bonded labour system in Maharashtra, it is stated that the Committee was informed by the Prant Officer, Thane that it found that a person sitting near the muster-clerk paying wages was collecting some amounts due to the local money-lender (p 23). This is no doubt against the rules but this is not bonded labour. Illegal and improper recovery of loan by itself is not bonded labour. The Report lacks depth expected of a committee of experts.

The Committee submitted its report to the Government of Maharashtra something in October 1977. However, the government has not announced either the acceptance or rejection of these recommendations. The legislature has not found time to discuss it. A new government has assumed office. To undo the old 20-point Programme, the new government has declared a 40-point Programme in which there is no mention of any programme for bonded labourers. It appears that those who drafted this programme believed the earlier official stand that there was no bonded labour in the state. They had not heard of the Committee on Problems of Illicit money-lending and Bonded Labour nor of its Report submitted nearly eight months before the drafting of the programme.

The Gandhi Peace Foundation and the National Labour Institute are conducting a survey of bonded labour in India. According to their provisional estimates, the number of bonded labourers in Maharashtra would be about 1.05 lakhs. But how can one expect the coalition of parties that now rules the state, and which does not even know the existence of the problem of bonded labour, to solve it?

Masterpieces inspired by Indian Dyes

Adroit-1514

MADHUBANI

Paintings in the characteristic Madhubani style are today much sought after all over the world Loose-limbed, exaggeratedly vertical figures, almost naively drawn, but nevertheless with a reserve of strength in their forms, dominate the compositions Foliage and flower are stylized and elaborated into extended decorative patterns

In Madhuban and its neighbouring villages in the southeast of India, this style of painting was used traditionally for murals on the outside of huts Today the designs are being adapted on fabric and paper

The Madhubani murals were executed only by women who obtained all the colours used from natural sources Sensuous scarlet and deep sienna from the Kusum blossom, bright yellow from turmeric, soft gold from a compound of banana leaf juice, milk and lime, rich black from encaptured smoke, these were then mixed with goat's milk and Bakul tree gum as binding media.

Indian dyes have come a long way since then

Today Atul Products produces a wide range of Synthetic Dyes which help colour everything from fabrics of cotton, jute, wool, art-silk, and man-made fibre, to leather and paper

Atul also produces Dye Intermediates to help make Synthetic Dyes, and Optical Whitening Agents which make whites look whiter.

Wherever there is colour, there is a dye. Atul makes some of the finest man-made dyes.

THE Jekyll and Hyde act of the IMF has now become a permanent feature. Actually as far as the poor countries are concerned, there is little to choose between the two faces of the Fund. If the Interim Committee's main purpose is to foster and promote the existing perverse pattern of things, the Development Committee merely serves to put a facade of good intentions of rectifying the perversities. But, every one knows by now, it is no more than a facade.

Again the two committees have met. The most important outcome of the meetings has been the agreement in the Interim Committee to give the green signal for the establishment of the Substitution Account. The Fund's Board of executive directors has been authorised to work out the details of such an Account.

The Committee of 20 had also spoken of the need, under a reformed world monetary system, to establish appropriate arrangements to ensure sufficient control over the aggregate volume of official currency holdings. In this context the Committee noted the possible existence of an overhang of certain currency balances "at the restoration of general convertibility" and the need for the establishment of a Substitution Account through which SDRs may be issued in exchange for certain reserve currencies. This would, it was felt, reduce the general role of the reserve currencies and strengthen the position of SDRs.

Under the illustrative scheme drawn up by the Committee of 20, the official holders of foreign exchange are entitled to buy SDRs in return for the foreign exchange they surrender to the Account. Even issuers of the reserve currencies, for which the Account is established, can buy SDRs in exchange for such currencies to the extent of the decrease in their official liabilities below a maximum level to be agreed, "which would be the level existing at the time that the Account is established". While the scheme did not envisage any sale of currencies out of the Account, it was to have provision for the reserve issuers to amortise the balances of their currencies held in the Account.

Though the Substitution Account was thus mooted in 1974, the US was not very enthusiastic about it. To agree to the establishment of a Substitution Account would have meant acceptance of defeat for the dollar. It would have meant acceptance of the notion that the dollar was no longer good enough to be acceptable as a reserve currency. At the practical level, it would have meant surrendering the right to borrow in future on the basis its *short-term obligations*, a right it has exercised in abundant measure since the early 1950s. The increase in US liquid liabilities abroad over the past 28 years, since 1951 that is, has amounted to some \$ 200 billion. In addition, Eurodollar obligations had been incurred through the overseas branches and subsidiaries of US commercial banks and these obligations now amount to something like \$ 350 billion.

The fact that the US is now agreeable to the establishment of a Substitution Account may be taken by some as signalling the end of the suzerainty or supremacy of the dollar. After all, it may be argued, the dollar has had to suffer some very ignominous declines in its exchange rates with several other currencies, particularly in the past 12 months or so.

Or does it represent a mere change of stance by the US? Firstly, it is not clear whether by agreeing to the establishment of the Substitution Account, the US is at the same time accepting the obligations (a) not to allow its short-term obligations abroad to cross the point it has now reached; and (b) to gradually reduce these obligations hereafter. Secondly, it is not sufficiently realised that the major factor which enabled the US to borrow abroad in such abundant measure was the continuing willingness, indeed anxiety, on the part of the reserve accumulating countries to hold dollar balances. If this tendency persists what is there to prevent the US, in collusion with the reserve accumulating countries, to find other ways and means of creating dollar balances? In any case, increasing resort to Eurodollar deposits is always possible. Thirdly, it is not sufficiently recognised that SDRs do not offer a particularly more attractive form of investment than dollars. The SDRs' value has been virtually tied to the dollar through the basket-formula. The SDR value of the dollar declined by only 2.6 per cent between end-1973 and June-end 1978, whereas in the same period the gold value of the dollar declined by 75 per cent (representing a four-fold rise in the dollar value of gold). Never was a greater farce invented, to put it dramatically. Moreover, the SDR carries an interest which is always less than the short-term rates on major currency obligations. In any case,

... issue hereafter ... dollars and other potential reserve currencies.

So the establishment of the Substitution Account may well be meant as another sop. But in the process one aspect of the present goings on in the monetary arena will have been revealed, namely that anything that suits the rich countries is acceptable, notwithstanding its blatant regressive character. After all, allowing $ 200 billion to be converted into SDRs would amount to extending multilateral credit to the richest country of the world. The link is there for any but the blind to see. And the other link which the poor countries spoke about has been buried deep.

Credit Policy

Writing on Sand

TOWARDS the end of November last year the Reserve Bank called in commercial bankers and told them to confine additional credit between December 1, 1978, and March 31, 1979, to "well within" 40 per cent of the growth in their deposits during the period. The Reserve Bank had taken alarm at the rapid increase in bank credit during the eight weeks preceding mid-November. To underscore its seriousness, it raised the statutory liquidity ratio from 33 to 34 per cent. According to the rules of the game, when the Reserve Bank sneezes the commercial banks should catch pneumonia. However, during the quarter after the November meeting, the banks have not pretended to even a modest cold. The pace of credit expansion has matched expansion of deposits, including demand deposits. To save face, the Reserve Bank has now explained that its stipulation that incremental credit-deposit ratio should be less than 40 per cent was not meant to be taken too rigidly. Further, it has even gone on to make excuses on behalf of banks by pointing out that "banks require a better monitoring system...".

So the Reserve Bank's revised prescription of March 15, which leaves ambiguous the question of any particular credit-deposit ratio to be aimed at, is that "internal machinery of data collecting and monitoring in banks must be strengthened to keep a close watch over credit expansion week by week". There is also the mandatory reference to 'greater' scrutiny of accounts with credit limits of Rs 50 lakhs and above so that, wherever utilisation has reached 60/65 per cent, "further" credit ... production or ... commitment. For good measure, it is also stipulated that defaults in statutory liquidity ratio would bar access to refinance and defaulters who, as on March 30, have drawn on refinance would have to pay penal interest of an additional three per cent on refinance equivalent to the shortfall in the statutory ratio. But what passes comprehension is how the Reserve Bank can formalise defaults in the *statutory* liquidity ratio. That apart, the emphasis of credit policy is clearly on monitoring credit above a certain ratio and not on "greater scrutiny". The cut-off point of "60/65 per cent" is also not exactly low, considering that the average utilisation ratio is around 60 per cent.

A key portion of the credit policy statement of March 15 suggests reallocation of credit: "There would be additional sizeable seasonal requirements of credit in respect of commodities like foodgrain, sugar, cotton, tobacco and tea in the next few months. These needs will have to be met. Hence it is all the more necessary that credit to other borrowers who had already drawn heavily on the banking system should be carefully regulated to meet only the most essential requirements." While credit regulation has been suggested with respect to heavy drawings, banks have been cautioned that such regulation should be effected "carefully". What if the regulation does not yield enough for significant reallocation of credit to meet seasonal requirements? Besides additional deposits — triggered by sizeable deficit financing by the government — there would always be 'discretionary' refinance, the only bar to its availability presumably being fulfilment of the statutory liquidity ratio.

Including additional food credit of Rs 365 crores, bank credit to the commercial sector increased by Rs 3,548 crores, or 16.7 per cent, between the end of March 1978 and February 23, 1979, against Rs 1,920 crores (including food credit Rs 69 crores), or 10.2 per cent, in the corresponding period of 1977-78. Supporting the credit expansion during 1978-79 was a rise in demand and time deposits by Rs 4,399 crores. Incremental credit-deposit ratio during 1978-79 has thus been close to 80 per cent. This increase in the face of liquidity requirements which pre-empt about 40 per cent of additional deposits has been something of a feat. It has taken place with the connivance of the Reserve Bank which has allowed the banks to ... issue ... ces, banks have ... for bringing in funds from institutions like the LIC and others and thus boosted credit. Banks have also manipulated deposit growth through inter-bank arrangements. Had banks been denied such freedom, they would have had to approach the Reserve Bank for discretionary finance on a scale which, if met, would have been embarrassing for the central banking authority. By turning a blind eye to the banks' manoeuvres, the Reserve Bank has saved itself this embarrassment and kept up the pretence of tightly controlling banks' borrowings from it.

The Plan

Rhetoric Belied

THE total Plan outlay of the Centre, the states, and the union territories in 1979-80 has been fixed at Rs 12,511 crores, a modest increase of 7.4 per cent over the outlay of Rs 11,649 crores fixed for 1978-79. The outlay provided in the first two years of the Sixth Plan is thus about 35 per cent of the total public sector outlay of Rs 69,380 crores fixed for the five-year period. Thus, as with earlier Five-Year Plans, the five-year target of financial outlay may be fulfilled. However, what is known about the progress of different Plan projects and programmes in real terms in 1978-79 is a clear warning that, once again as in the past, large shortfalls are inevitable in the achievement of the physical targets.

Of the total Plan outlay fixed for 1979-80, Rs 6,412 crores will be on the Centre Plan and Rs 6,099 on the Plans of the states (including the union territories). There will thus be a rise of 13.2 per cent in the size of the Central Plan, but of only 1.9 per cent in that of the state Plans. The decline in the relative size of the state Plans is one of the interesting features of the 1979-80 Plan. In the 1978-79 Plan, the states had accounted for more than half of the total outlay, 51.4 per cent to be precise. In 1979-80, the states' share of total Plan outlay will come down to 48.5 per cent.

Central assistance for the Plans of the states in 1979-80 has been fixed at Rs 2,300 crores, compared to the budget estimate of Rs 2,761 crores and the revised estimate of Rs 3,112 crores in 1978-79. The states will, therefore, have to finance 62.3 per cent of their Plan outlay in 1979-80 out of their own resources, compared to 53.9 per

cent in [illegible]

The cut in Central assistance for state Plans has presumably been made after taking account of the larger devolution of tax revenues from the Centre to the states, following the recommendations of the Seventh Finance Commission. On the whole, however, it is clear that the changes wrought by the Finance Commission have not made possible any worthwhile increase in the outlay on the states' Plans. This is because much of what the states have gained on the swings as a result of the Commission's award, they have lost on the roundabouts. Thus while states' share of taxes and duties is put at Rs 3,440 crores in the 1979-80 budget, compared to Rs 2,020 in 1978-79 according to the budget estimates and Rs 1,957 according to the revised estimates, total grants and loans from the Centre to the states have declined to Rs 4,361 crores compared to Rs 5,017 crores in 1978-79 according to the budget estimates and Rs 5,337 crores according to the revised estimates. Taking into account the benefit to the states of the debt relief recommended by the Finance Commission, the total net transfer of resources from the Centre to the states and union territories in 1979-80 has been estimated at Rs 6,938 crores, compared to Rs 6,007 crores in 1978-79 according to the budget estimates and Rs 6,532 crores according to the revised estimates.

A second interesting feature of the Plan for 1979-80 is that despite the alleged pro-agriculture bias of the Janata government and particularly of Charan Singh's Union budget for 1979-80, the Plan outlay on agriculture and allied programmes shows only a meagre rise of 3.2 per cent over 1978-79 (see accompanying Table). As a result, the share of agriculture and allied programmes in the total Plan outlay declines from 15.1 per cent in 1978-79 to 14.5 per cent in 1979-80. Taking agriculture and allied programmes and irrigation together, their share of total Plan outlay goes down from 24 per cent in 1978-79 to 23.6 per cent in 1979-80. In both years, their share was lower than the 24.2 per cent share assigned to them in Draft Sixth Plan. By contrast, the share of large and medium industry and mining and transport and communications — fixed around 34.5 per cent in the Draft Plan — comes to 36 per cent in 1978-79 and 37.5 per cent in 1979-80.

[illegible] Development [illegible]

		1979-80	1978-79	Change in 1979-80 over 1978-79
(1)	Agriculture and allied programmes	1811 (14.5)	1754 (15.1)	+ 3.2
(2)	Irrigation	1141 (9.1)	1039 (8.9)	+ 9.8
(3)	Flood control	117 (0.9)	127 (1.1)	− 7.9
(4)	Power	2440 (19.5)	2197 (18.9)	+11.1
(5)	Village and small industries	287 (2.3)	219 (1.9)	+31.1
(6)	Industry and mining	2551 (20.4)	2414 (20.7)	+ 5.7
(7)	Transport and communications	2137 (17.1)	1782 (15.3)	+19.9
(8)	Education	275 (2.2)	413 (3.5)	−33.4
(9)	Medical and public health	385 (3.1)	393 (3.4)	− 2.0
(10)	Water supply and sanitation	427 (3.4)	338 (2.9)	+26.3
(11)	Housing	205 (1.6)	206 (1.8)	− 0.5
(12)	Urban development	130 (1.0)	133 (1.1)	− 2.3
(13)	Backward class welfare	90 (0.7)	96 (0.8)	− 6.3
(14)	Social welfare	27 (0.2)	29 (0.2)	− 6.9
(15)	Other programmes and services	315 (2.5)	351 (3.0)	−10.3
(16)	Tribal sub-plan	70 (0.6)	70 (0.6)	—
(17)	Hill areas programmes	55 (0.4)	53 (0.5)	+ 3.8
(18)	North-Eastern Council	47 (0.4)	36 (0.3)	+30.6
	Total	12511	11649	+ 7.4

Note: Figures in brackets are percentages of total Plan outlay.

A third feature of the Plan for 1979-80 is the relative and absolute decline in the outlay on most of the major programmes in the sphere of social services. The outlay on education, medical and public health programmes, water supply and sanitation, housing, urban development, welfare of backward classes, and social welfare, taken together is fixed at Rs 1,539 crores in 1979-80, compared to Rs 1,608 crores in 1978-79. Their share of total Plan outlay goes down from 13.8 per cent in 1978-79 to 12.3 per cent in 1979-80. This is indeed a development of considerable significance since, according to the government's and the Planning Commission's own thinking, these are the programmes which have a direct bearing on the condition of the poor.

Revised estimates of the likely total Plan outlay in 1978-79 are not yet available, but such estimates for the Central Plan are. The revised estimates show the outlay on the Central Plan in 1978-79 to have been Rs 5,392 crores — a shortfall of Rs 272 crores compared to the original provision of Rs 5,664 crores. There was a shortfall of Rs 184 crores or 8.1 per cent in the outlay on large and medium industry and minerals. Excluding the food-for-work programme, the outlay on which is expected to rise by Rs 70 crores over the Budget estimate of Rs 30 crores, the revised estimate of outlay on agriculture and allied services in the Central Plan in 1978-79 shows a shortfall of Rs 116 crores or 14.9 per cent over the original estimate. There is also a shortfall of Rs 68 crores or 8.6 per cent in the outlay on social and community services.

Available details of the Central Plan outlay on industry and minerals indicate a marked loss in the momentum of development of the petroleum industry. Not only is the revised estimate of Plan outlay on petroleum in 1978-79 Rs 109 crores or 19 per cent lower than the original provision of Rs 573 crores, but even the provision of Rs 575 crores in the Plan for 1979-80 shows hardly any increase over the level of Rs 562 crores estimated to have been achieved in 1977-78, the last year of the Fifth Plan. Referring to the decline in the revised estimate of Plan outlay on petroleum in 1978-79 over the original provision, the Ex-

planatory Memorandum to the Budget for 1979-80 admits to "rephasing and postponement of certain offshore activities [of the ONGC] in exploration" as well as to delay in the commissioning of the crude distillation unit of the Bongaigaon refinery.

Another important industry where the development effort in the public sector appears to have flagged is fertilisers. This is a matter for some concern, considering that in the five years ending 1977-78, the value of fertiliser imports into the industry averaged over Rs 400 crores per annum. There was a shortfall of 10.9 per cent in the Plan outlay on the public sector fertiliser industry in 1978-79, according to the revised estimates. Further, the outlay of Rs 254 crores provided in the 1979-80 Plan is substantially lower than that in 1977-78, Rs 279 crores. The Explanatory Memorandum to the 1979-80 Budget points out that there was delay in the sanctioning of the gas-based plant in the west coast, that the progress of the Trombay V Project was slow, that there had been 'slippages' in the Cochin II project and the project of the Hindustan Fertiliser Corporation and that the commissioning of the Bhatinda, Panipat and Nangal expansion scheme had all been delayed.

The Explanatory Memorandum refers to shortfalls also in the progress of many other major industrial projects. Thus there have been "delays in delivery of equipment, awarding work contracts, etc" in respect of the Nowgong, Cachar and Nagaland projects of Hindustan Paper Corporation. The progress of civil, structural and electrical works of the Nuclear Fuel Complex has been slow and there has been delay in the procurement of equipment. There is a shortfall of Rs 20 crores in the outlay on the Kudremukh project which is attributed to "delay in placement of orders for certian electrical equipment and changes made in specifications". Under mines and minerals, there are significant shortfalls in respect of Neyveli Lignite Corporation (Rs 11.49 crores) due to delay in ordering equipment for any schemes, Mineral Exploration Corporation (Rs 3.5 crores), Bharat Aluminium (Rs 2 crores) due to lowering of production target for the current year and Bharat Gold Mines (Rs 1.3 crores).

The budget can, however, give only a [illegible] view of the progress of development programmes and projects, since even when actual expenditure equals or exceeds the budgetary estimate, there may be significant shortfalls in the progress in real terms due to rise in project costs. Such cases escape budgetary scrutiny which focuses only on the progress of financial outlays in comparison with budgetary provisions.

West Asia

Playing for High Stakes

THE 'peace treaty' that is to be signed between Egypt and Israel marks the logical culmination of a series of steps taken by Egypt in the past five years to arrive at a separate settlement with Israel. It is also a most notable instance of successful US diplomacy whose aim has been to somehow detach Egypt from the historic Arab position that there can be no settlement in West Asia without the recognition of the legitimate rights of the Palestinian people. Despite being constantly engaged in *mutual rivalries and conspiracies*, the Arab states had always been united on the question of Palestine; and it was most important that this unity had to be breached. The finesse and sophistication of US diplomacy can be seeen in the unrelenting pressure it brought upon Egypt to shift, step by step, from the historic position; and the impression it created successfully that even as Egypt was being subjected to these pressures, it was Israel (which had made few concessions) that was being pressured so resile from its rigid stand that there can be no negotiations unless its own legitimacy in the heart of Arab lands was recognised. In fact, it is doubtful whether as a consequence of this settlement even the limited gains that Egypt hopes to make can be realised; and the vacation of Sinai is to be spread over three years. As for West Bank and Jerusalem, the Israeli Prime Minister has announced that "there will be no border in the land of Israel" — which means that Israel does not in the least intend to relax its tight control on the West Bank and that the idea that the US has tried to sell to the Arabs that such an 'autonomous' and eventually 'independent' Palestinian state on the West Bank would emerge is so much prevarication. On Jerusalem, of course, the Israeli Prime Minister has emphatically maintained that the city would be the 'eternal capital' of the land of Israel.

There are of course many unresolved problems; the timetable for the 'self governing authority' that is supposed to emerge in the West Bank and Gaza remains as vague and riddled with contrary understandings as before; Israel has rejected the Egyptian demand that it should be allowed to station military liaison officers in Gaza; nor has [illegible] over whether the forthcoming Egypt-Israeli treaty should prevail over any other commitments Egypt might have to other Arab states. Israel insists that it should be so while Egypt would like to pretend to the world that it continues to attach greater importance to its commitment to other Arab states. And of course, the larger question of the Palestinians — surely the key to any viable settlement in West Asia — is left hanging in the air. All this is well known and yet Egypt has at every stage acquiesced in Israeli demands and plunged headlong into compromise after compromise.

But despite the notable success US diplomacy has achieved in finally getting Egypt and Israel to agree, under its aegis, to sign a separate peace treaty, it should be obvious that this is by no means the end of the story. For the reality of Palestinians and the strong feelings that their cause evokes among Arab masses including those in Egypt is something that no paperwork can wish away. Sadat's retreat from the Arab position has been of so dramatic and total a kind that even the most conservative Arab states have not dared to back him openly. Till now, it has only been Hassan of Morocco (who along with Sadat continues to be a loyal supporter of the deposed Shah of Iran) who has extended support to Sadat's moves. But Morocco is fairly peripheral to the actual situation on the ground in West Asia; what would have been more crucial was support from countries like Jordan, Lebanon and Saudi Arabia.

That the United States risked earning the displeasure of countries like Saudi Arabia but nevertheless gave its firm material and political support to Sadat shows what great importance the US attaches to securing a settlement of its choice in West Asia. The anxiety should have been heightened by other developments in the region — the fall of the Shah's regime in Iran, the intensifying of the struggle in the Yemens, the developments in Afghanistan, all in one way or the other marking a setback to the United States in the region. With Egypt now clearly, even if temporarily, detached from the histroic Arab position on Israel, and Israel itself relieved of pressures from the biggest and most powerful of its Arab neighbours, this run of setbacks might be said to have been stopped. Much will naturally depend on how US diplomacy would proceed further now and persuade countries like Jordan and Saudi Arabia to extend support — or at least refrain from openly opposing the settlement.

India-China Relations: Struggle between Two Lines

THE second conference of the India-China Friendship Association, Andhra Pradesh, held at Vijayawada recently brought to the surface the struggle between two lines and the attempts of the 'majority' group to reduce the association to a pocket organisation. The 'majority' group was subjected to merciless criticism on both policy and organisational planes. A section of the delegates, though in a minority, could, by their principled arguments, make the majority jittery. Fearing that the minority would drive a wedge into their handpicked ranks, the 'majority' resorted to undemocratic methods. They shortened the time for discussion on policy and created pandemonium through their hired goondas whenever a speaker from the minority group sought to explain the group's point of view.

The India-China Friendship Association in Andhra Pradesh came into being in 1974. The first conference was held in January 1974 at Ongole. A policy statement was adopted. In spite of many limitations in the way of creating a common basis for friendship between these two countries, it had certain references to the two superpowers, i.e, America and Soviet Union, that were coming in the way of friendship between India and China. There was anti-imperialist content in the policy statement. Apprehensions were voiced about the Indo-Soviet Treaty of 1971 and the Asian collective security proposal as they were directed against China. Most of the committee members, however, became inactive during the Emergency, including the president and the secretary. In the post-Emergency period a handful of state committee members, by co-opting their 'yes' men, styled themselves as the 'state committee' and hurriedly brought out a new policy statement, a much diluted one, to suit their political allies, the Janata party and the CPI (M).

Meanwhile the second conference of the East Godavari district unit held a week before the 'state committee' meeting, adopted a policy statement which sharply criticised the two superpowers and their hegemonistic machinations. It advocated firm friendship between the people of India and China to defeat imperialism and Soviet social imperialism. It demanded the abrogation of the Indo-Soviet military treaty of 1971. The conference of the Guntur district unit held shortly before the state conference brought forward another policy statement, more elaborate but very much similar to that of the East Godavari unit. There was widespread criticism against the policy of the 'state committee' throughout the state among the forces standing for India-China friendship.

Fearing that they would be defeated, the 'state committee' resorted to all conceivable undemocratic methods to restrict the number of delegates with an alternative policy. Membership books were distributed through their people only. The district committee of East Godavari was completely ignored. The last date for enrolment was fixed and membership books were issued to the dissenters only two days before the last date for enrolment. On one pretext or the other many delegates were allowed only as fraternal delegates and were not allowed to participate in the proceedings of the conference. By all such undemocratic methods the 'state committee' was able to manipulate the delegation in its favour.

Three alternative policy statements were presented before the conference — one by Ravibabu, a state committee member, and the other two from the Guntur and East Godavari district units The Guntur alternative was withdrawn in favour of Ravibabu's statement. A close study of the 'official' policy statement and the alternative statement and the discussions that followed revealed the hollowness of the friendship slogan raised by the 'majority'. The 'majority' tried to confuse normalisation of relations with friendship, while the minority argued that the two are not the same and that friendship presupposes a common interest. "In the present context the basis for friendship is anti-imperialist and anti-hegemonistic" the minority argued. The minority also argued that the friendship movement must recognise and declare that Soviet hegemonism is the greatest obstacle in the way of normalisation of relations between India and China and another obstacle is the Soviet lobby inside India. "The Indian government is bowing to the pressures of Soviet Union and Soviet lobby within and outside the ruling class", they argued. They accused the 'majority' of not making any reference to these facts in the policy statement. They further insisted that a demand for the abrogation of the Indo-Soviet Treaty should be made. A resolution to this effect was proposed, but the presidium refused to permit its introduction. The minority group also attacked the stand of the 'majority' that the friendship movement is not a forum to discuss the foreign policy of the Indian government, on the ground that friendship or rivalry between countries is certainly a product of their foreign policies.

The 'majority' sought to evade all the arguments raised by the minority by saying that there is a need for a broadbased organisation and hence controversial points should be avoided. The minority argued that the meaning of a broadbased organisation was definitely not what the majority were advocating. They charged that the majority were trying to accommodate certain political parties by diluting the scope of the movement. Hence there was every possibility of non-genuine and pro-imperialist forces joining the movement and rendering it ineffective. The 'majority' were also accused of confining the movement to the wishes of the Indian ruling classes.

As an alternative, the minority proposed that the movement for friendship between India and China should be directed against superpower hegemonism and particularly that of the Soviet Union which is the main source of danger of another world war and which has become the main stumbling block in the way of normalisation of relations and friendship between India and China. The friendship movement must draw its strength from genuine pro-friendship forces who are anti-imperialist and anti-hegemonistic.

The conference thus opened the two-line struggle in the organisation. The struggle between genuine forces for friendship and fake forces. The conference raised the hope that in spite of the initial defeat, the genuine forces will gain ground and a mighty mass movement for friendship between India and China will sweep the country in the near future, much to the chagrin of the 'majority'.

P JAMUNA

Vijayawada
January 21

Looking for Alternatives?

Romesh Thapar

EXHAUSTED by the endless power struggles in Uttar Pradesh and the confusions building over the repercussions of the Budget proposals, the Janata government is generally taking a low posture on as many problems as possible — indeed, even on Prime Minister Kosygin's visit following the Chinese adventure in Viet Nam. Despite the apparent political lull, it is possible within ruling circles to discern a visible concern about the viability of the Janata party.

The situation is strange, to say the least. Apart from Uttar Pradesh and Bihar, the states seem to be functioning with a fair degree of competence. Continentally, every political party is exercising power at some point or another. Yet, at the Centre, there is despair and disarray about the mechanics of operating as a coherent government. The usual explanations for this state of affairs can be trotted out — and are! — but it is no longer possible to dismiss with ease the charge that the system which underpins governance in India is showing serious cracks at a *time of* political incoherence.

Until now, we have spoken of tangles and tensions within the system, but this phase is passed. We are entering more unsettled times. There seems to be general acceptance of this assessment. If this is true, are we on the edge of rejecting the experiments of thirty years and beginning the hard work of evolving another democratic alternative more suited to the challenges which are crystallising? *Of* this, too, there is little evidence.

There is a certain amount of cogitation about a presidential system working through elected governors, and buttressed by specialised talents a form that might preserve legislatures as useful sounding boards. There is talk of smaller, more manageable states, based on socio-cultural divisions and with more simplified political superstructures. And arising from these debates, thoughts surface about panchayat and zilla based systems which will do away with a whole paraphernalia of what is seen as democratic disruption.

What Indira Gandhi's obsessive concern with her personal fortunes and the Janata party's intensely personal faction-fighting have done is to place a premium on political corruption and fiddling. The public was insulated to some extent from the developing political mess by the effort of the Congress party to keep the deadly play of politics secret. With the Janata party's open-house approach, the political chaos is receiving wide and daily publicity. This has brought the politician into total contempt. Significantly, all the discussion about alternative systems attempts very consciously to reduce drastically or to dissolve the role of the politician. I think this is real measure of the crisis.

In the absence of an elaborated or acceptable alternative — this is very much the position today! — the attention of all political parties is focused on the changing alignments in the Janata party at the Centre. The antagonisms around the Jan Sangh/RSS can destabilise the political arrangements of 1977 which were expected to last until the next general election in 1982. At the same time, it is not unlikely that a threatened break-up of the Janata party could compel it towards a more organised and disciplined coalition functioning.

A number of factors are pushing the Indian political situation in the direction of a frankly accepted coalition government at the Centre. If all our *major political parties have found* fairly durable bases for themselves in the states, two formations feel their alienation at the Centre. Indira Gandhi's party, increasingly directed by the Sanjay mafia, is unable to extricate itself *from the whirpools of the Emergency.* The Jan Sangh/RSS in the Janata party, widely suspect of attempting to "capture" the political organisation, is again under assault as a conspiratorial and communal body. In a sense, apart from these two, the rest are eyeing each other with the prospect of varying alignments in view.

However much the Indian mind distrusts coalitions, and longs for the stability of a single amorphous, continental party capable of absorbing confrontations and collisions through consensus techniques, the hard fact remains that the independent growth of of various parties regionally — the CPI (M) in East India, the CPI in Kerala, the DMK and AIDMK in Tamil Nadu, the Akalis in the Punjab, the Congress in some southern States, the BLD and Jan Sangh in the northern states — will have to find reflection at the Centre if a certain balance and stability is to be restored to the political system. And this will mean a more openly accepted coalition form of government.

An alternative of this kind, which does not demand a major restructuring of the system, has to be tackled by the ruling Janata party if it wishes to emerge from the confusion now engulting it. It is a matter of deep frustration that Prime Minister Morarji sees no need to stir. Nor does the party's President, Chandra Shekhar. The second level of leadership keeps looking for a captain in order to present itself as a team capable of replacing the "elders". If the paralysis persists, will Charan Singh or Jagjivan Ram take the plunge towards new alignments?

Someone has to take a risk. Politics in India has become a business without risk-taking. That's the trouble.

March 10.

Mixed Picture

[illegible]

ALKALI AND CHEMICAL CORPORATION OF INDIA has suffered a severe setback in its performance during 1977-78. There was a strike at Rishra works for over 70 days and expenses incurred in the initial period at the new Ennore works and higher interest charges following increased borrowings raised to finance the new projects. Total net sales have declined modestly from Rs 46.53 crores to Rs 45.24 crores; but gross profit has fallen steeply, from Rs 3.13 crores to Rs 1.52 crores. Although there is no tax liability on account of substantial reliefs being available from capitalisation of the new projects, net profit is almost halved at Rs 64 lakhs (Rs 124 lakhs). The directors skipped declaration of interim dividend and proposed a single dividend at 10 per cent which is covered 1.84 times by earnings. Production of polyethylene was lower early in the year, but was subsequently maintained at the rated capacity. The entire production was marketed in spite of large arrivals of imported material and the start-up of IPCL's new plant towards the end of the year. Looking to the rapidly developing competition, the management is taking steps to develop newer polymers and applications. The company has also made representations for reduction in the levies imposed on alcohol by the state government. Sales of rubber chemicals in the earlier part of the year were poor owing to disruption in production at Rishra, but subsequently both production and sales were maximised: Diphenylamine and rubber chemicals capacities were enhanced. The company is now able to meet total domestic requirements of of diphenylamine. Turnover of paints was maintained. The company established usage of new products by industrial customers by the electrostatic spray and electrodeposition processes. Production of caustic soda and chlorine was curtailed as the cell room could be only gradually put back into production after rebuilding a major number of cells. All pharmaceutical formulations in the current range were produced at the Ennore plant, which was commissioned towards the end of 1976-77. The bulk chemicals plant was also commissioned and a number of chemicals were manufactured there. Demand for BHC continued to be good, but production was affected, the management claims, because of the strike in the earlier part of the year and subsequently because of erratic supply of benzene. Sales of Gramoxone increased by over 30 per cent.

BOMBAY BURMAH TRADING CORPORATION has turned out poor results for the year ended September 1978 with lower sales and profits. Margins are also lower and dividend, lowered by two points to 18 per cent on the capital enlarged by a one-for-four bonus issue, is covered 1.47 times as against two times previously. Production of tea in the South Indian estates was higher at 59,79,515 kg as against 54,11,163 kgs; but unit cost rose to Rs 7.21 per kg. The coffee crop increas-

... is 751 tonnes to 1,149 tonnes and ... point valuation has been taken at Rs 6.50 per point. Cardamom crop also increased from 1,297 kg to 1,479 kg. The Tanzanian estates too yielded a higher crop of 6,33,563 kg of tea as against 5,52,629 kg in the previous year, but the estates earned a lower profit before tax of Rs 17 lakhs against Rs 66 lakhs because of a fall in tea prices. The company's electronics division is estimated to return only a small loss in the current year. The new factory buildings are not yet fully completed. Future prospects of this activity are being evaluated. Among the wholly-owned subsidiary companies, AFCO showed a loss of Rs 6 lakhs allegedly due to prolonged strike for 4 months by workmen in its electronics division. The order book of this division for the current year is satisfactory and volume of business of the marine consultancy division continues to be satisfactory. A consumer products division has been started for distribution of certain products of Whitco in the western region. Accounts of Chawla Chemical Industries for the year ended March 1976 and subsequent years have not yet been signed by the auditors and adopted by the shareholders, since there is a dispute with the previous management over certain irregularities pointed out by the auditors. The directors hope the position will be resolved soon and that this unit can be rehabilitated. Vitro Pharma Products was acquired by the company from AFCO at cost after the close of the former's accounting year.

BASF INDIA is expanding its activities. It has secured an industrial licence for substantial expansion of capacities for fatliquors and binders at its Thane plant. A 'letter of intent' has been received for production of a special resin for export. The company has also been issued another industrial licence for manufacture of leather tanning and finishing agents and speciality dyestuffs at Bokaro in Bihar. A plot of land has been allotted to the company in the newly developed BIADA area. Construction work will start there as soon as a motorable road up to the proposed factory is ready. Meanwhile, with the rising tempo of manufacturing activities various service facilities at the existing factory are being augmented. Order for a new boiler has been placed and it is intended to instal an 800 KVA diesel generator in the current year. A new finished goods warehouse has been completed. With all the divisions contributing to its revenues, the company has produced good results with higher sales and profits as well as margins.

INDIAN DUPLICATOR's performance during the year to October 31 last has been very good with gross profit expanding from Rs 29 lakhs to Rs 79 lakhs, following a 21 per cent rise in turnover from Rs 6.31 crores to Rs 7.67 crores. Although tax liability has taken away a much bigger slice, net profit is Rs 23 lakhs compared to the previous year's Rs 9 lakhs. Dividend is kept unchanged at 15 per cent, but is payable on enlarged capital and is still covered nearly 1.3 times. The company increased its export sales from Rs 46 to Rs 56 lakhs. It has represented to the government for substantial reduction in the export obligation of 75 per cent of production of the Nasik factory in view of the business conditions prevailing in the world markets. The company has issued and allotted shares to financial institutions and the Indian public in accordance with the approved scheme. It has applied, however, for a 'carry on business' licence in duplicating machines and stencil paper which items it has been manufacturing. The application has been necessitated because of a notification of the ministry of industry enlarging the list of items reserved for the small-scale sector by including therein "duplicating machines — other than special type" and "stencil paper".

SIEMENS INDIA is expanding its operations. It is setting up a new switchboard factory near Calcutta at a cost of Rs 2 crores. This unit is expected to go into production by June or July next. Another new factory is proposed to be established at Nasik in Maharashtra to manufacture power-engineering products. This is estimated to involve a capital outlay of about Rs 6 crores and is expected to go on stream sometime next year and should be in full swing in three years according to H Langer, the managing director. Both the projects, which are intended to be financed by internal resources and borrowings, are expected to contribute Rs 12 crores per annum to the company's turnover. Meanwhile, the company's factories in Bombay, which had experienced violent labour trouble last year, are working with the total strength of work force since November 11 last. The chairman, D M Khatau, is confident that all employees would work together to increase output and that the company would produce "very much better" results this year. During the first five months of the current year (October to February), orders booked have been 17 per cent ahead of the comparative figure of the previous year and turnover has been 8 per cent higher. The pending order position at the end of February last has been Rs 76.5 crores, about 27 per cent higher than the end-September 1978 figure.

INDO-USSR RELATIONS

Mission of Failure

THE Soviet Premier's visit to India no doubt imparted new content to bilateral relations but it failed in its other objectives.

For one thing, Kosygin could not hustle India into recognising the new regime in Kampuchea. So much so Kampuchea does not even find a mention in the joint communique, underlining the sharp difference in approach. This was among the objectives he had set for himself when he announced his visit to India early in February, on the eve of Atal Behari Vajpayee's visit to Peking and the Viet Nam flare-up.

For another, he could not get India to denounce China over the Viet Nam issue in terms acceptable to Soviet Union. Kosygin chose to hurl epithets like "criminal", "murderer" and "robber" at China in the course of his address to Members of Parliament though he knew that India was seeking normal relations with it. Vajpayee's visit to Moscow towards the end of 1978 (a couple of weeks before his projected mission to Beijing which however had to be postponed) was similarly misused by the Soviet leadership to assail China's "expansionist" designs and to call for an Asian collective security system to thwart them.

The joint communique calls for withdrawal of Chinese forces from Viet Nam; but this no great achievement for Kosygin because India has been demanding it already, besides calling for withdrawal of Vietnamese forces from Kampuchea. More significantly, while Kosygin consistently referred to Chinese "aggression" in the course of his pronouncements in India, the joint communique refrains from use of this term it refers only to the Chinese "attack" on Viet Nam.

The admitted setback to the Vajpayee mission as a result of the China-Viet Nam military conflict and the absence of any dramatic breakthrough in Sino-Indian relations had restored sunshine to the hearts of the Soviet lobyists trafficking in public credulity. Its morale boosted, the lobby stepped up a strident campaign for a hardline against China, on the eve of Kosygin's visit.

Kosygin himself was trying to probe New Delhi's mind on where it stood in the Sino-Soviet confrontation. He wanted to know if India viewed the issue of normal relations with China in a bilateral context or viewed China as a permanent long-term threat to India and other neighbours.

Morarji Desai seems to have made it known to the Soviet Prime Minister that India was not abandoning its efforts towards normal relations with China; it did not seek improved relations with China at the cost friendship with any third country; and while India was prepared to take the initiative for a non-aligned move over the Sino-Viet Nam issue there was no question leading an anti-China front (just as it would not be a party to an anti-Soviet front).

In sum, Kosygin must have gone back disappointed despite all the euphoric statements for public consumption. In the Soviet assessment, if India were to recognise the regime in Kampuchea, at least 16 other non-aligned countries would follow suit. This has not materialised. India's reservations about the Phnom Penh regime have strengthened the inhibitions of several other countries in the matter of recognition.

Significantly, there is no reference either in the joint communique to India's desire and efforts towards normalisation of relations with China. Like all other contentious issues, this was kept out of the communique and the obvious inference is that the Soviet Union does not favour this development.

As it became clear later, India is positively against the Soviet plan for collective security in Asia, which it thinks would divide the region instead of uniting it.

Though much is sought to be read into the joint call for early resumption of Soviet-United States talks on making the Indian Ocean a zone of peace, the call makes little sense. The talks broke down over Soviet involvement in Africa directly and through allies like Cuba. Moreover, neither Sri Lanka (which originally spearheaded the peace zone move) nor India has been very enthusiastic about pushing the plan. There has been a change in Sri Lanka's attitude after the change of regime there; it would rather have the countervailing presence of all big power navies in the Indian Ocean until the peace zone proposal becomes practicable. Indian initiative has slowed down mainly because the smaller littoral countries view Indian naval expansion plans with great apprehension. With Iran in turmoil and unlikely to push for a major Indian Ocean role India is the largest naval power among the littoral countries. Moreover, with the United States stepping up its naval presence in the Ocean Soviet Union can only be expected to match United States presence.

There was agreement between Soviet Union and India on the developments in non-Arab West Asia and this lends substance to the reference to South Asian stability in the joint communique. Kosygin tried to convince Morarji Desai that the Afghanistan regime was not under the Soviet thumb and maintained that Pakistan's assistance to Afghan rebels threatened stability in the region. Both sides feared that the break-up of the CENTO might be followed by an Islamic alliance which could have a destabilising effect on the Indian sub-continent.

This shared fear might prompt India to maintain stable relations with Soviet Union and profess strict neutrality in the Sino-Soviet conflict, while seeking improvement in relations with China. Until a new political option is gained, India will be obliged to depend on Soviet economic and military aid and the possibility of the West re-enlisting Pakistan as an ally provides the convenient alibi.

Ganga Bridge, Kanpur

Overseas Communication Services, Bombay, 76.25 m

A bridge over the Ganga

A massive 18-storeyed building

Both saved up to 50% steel by using

TISCON

TISCON cold-twisted ribbed reinforcing bars ensure a double benefit: better reinforcement as compared to plain mild steel bars and maximum saving in steel.

These are manufactured in two grades, TISCON 42 and TISCON 50, by Tata Steel and their sub-licensees and are available in sizes ranging from 6 mm to 36 mm diameters. [illegible] pattern and greater bearing surface of TISCON bars provide them with a bond strength that is 100% greater than that of plain mild steel bars. TISCON bars also have a higher yield and tensile strength. All of which make them the best and most economical choice for sturdy constructions like large buildings, bridges, dams, reservoirs, foundations and irrigation and power structures.

CONGRESS PARTY

Point to Chavan

THE decision of the Congress Working Committee to call off unity efforts with the Congress (I) was the second of its kind; the first time such a decision was taken to break the 'working unity' with the Congress (I) was in August last when Y B Chavan was the acting president of the Congress (Swaran Singh was abroad). This was done after Chavan's protege, Sharad Pawar, leading a group of 40 Congress legislators, defected from the Congress, brought down the Congress-Congress (I) coalition in Maharashtra, and formed a coalition government with the Janata party and other political parties in the state.

Angered by Chavan's and Pawar's defection, Maharashtra leaders, notably the two former chief ministers, V P Naik and Vasantdada Patil, successfully persuaded the Congress Working Committee to reconsider its august decision and open negotiations with Indira Gandhi for reunification of the two Congress parties. This was in November last when Indira Gandhi had won the Chikmagalur Lok Sabha by-election and was riding high. The CWC's resolution calling for exploratory talks with Indira Gandhi had been opposed by Y B Chavan, Karan Singh, Chandrajit Yadav, Hitendra Desai, Priya Ranjan Das Munshi, Mohammed Ali and A K Anthony; but they were in a minority. Swaran Singh, with the support of Naik, Brahmananda Reddy, C Subramaniam and others (including some pro-unity leaders whom he had nominated to the CWC) formed the majority and the CWC resolution was approved.

With the CWC resolution in their pocket, the pro-unity faction in the Congress at the Centre and in the states took it for granted that the reunion of the two Congress parties was a foregone conclusion. This faction also spread the impression that Indira Gandhi was 'repentant' of her decision to split the Congress in January last year. In the first two meetings with Swaran Singh, Indira Gandhi did indicate that she was genuinely interested in the unity and 'small matters' like accommodating the leaders of the two parties in positions of 'honour' could be solved amicably. From the beginning she had been asking Swaran Singh to persuade Y B Chavan, who she considered the leader of the anti-unity faction, to join the unity negotiations. Chavan's refusal to join the negotiations made Indira Gandhi apprehensive of his intentions. Chavan and his followers kept their intentions to themselves except to note that the joint statement of Indira Gandhi and Swaran Singh was "a mere letter of intent".

The negotiations on the 'modalities' for the reunification were carried on by Naik and Patil, Brahmananda Reddy and C Subramaniam. Swaran Singh too held four meetings with Indira Gandhi. At the end of each encounter, Swaran Singh announced 'further progress' towards the unity. The negotiators even agreed to the Congress (I) stand that Indira Gandhi alone should head the reunited party. In return they asked her to concede the leadership of the opposition in the Lok Sabha and the Rajya Sabha to Y B Chavan and K C Pant respectively, which meant removing C M Stephen and Kamalapati Tripathi from their positions. On the question of reorganisation and integration of the state and district units of the united Congress, Swaran Singh suggested that he should head a three-member committee to decide the question. But Indira Gandhi saw the danger inherent in the suggestion; it meant in her eyes the handing over of the united party to Swaran Singh who with Chavan would ensure that forces opposed to her in the states would take control of the party, replacing her own supporters. Chavan of course had made it clear to Swaran Singh that he would agree to the reunification of the two Congress parties only if Indira Gandhi agreed to the appointment of the three-member panel (with the Congress having a majority on it) to decide the 'reorganisation' and 'integration' of the two parties. Chavan naturally spoke to Swaran Singh from a position of strength, enjoying as he did the solid support and loyalty of a group of 50-60 Congress MPS.

Meanwhile, when Indira Gandhi reported on her negotiations with Swaran Singh to her partymen, the anti-unity faction (owing allegiance to her son) opposed the Congress terms for unity and prevailed upon her to break the negotiations. Thus, when Naik and Patil went to see her, she told them that those who wanted unity and wished to exploit her charisma and her appeal with and leadership of the masses were welcome to join her party. "There is no question of one Indian National Congress but it is only the Congress (I)." Frustrated with the 'insult' Naik resigned from the CWC and returned to Bombay along with Patil.

Indira Gandhi had many other good reasons to terminate the negotiations. She was not able to get a firm assurance from the Swaran Singh group that it would participate in street demonstrations in the event of her and her son's arrest. Swaran Singh could give no such assurance because he was already threatened by the CWC member Priya Ranjan Das Munshi that there would be counter-demonstrations should the united Congress decide to go to the streets in the event of her and her son's arrest. Chavan too spared no efforts to torpedo the unity moves. On the Congress party's stand on the special courts bill, Chavan persuaded Swaran Singh to attend the meeting of the Congress Parliamentary Party and secured in his (Swaran Singh's) presence the approval of the party for a conscience vote. Chavan also persuaded the pro-unity leaders like Brahmananda Reddy and Subramaniam to remain absent from the Lok Sabha during the voting on the bill. Indira Gandhi had expected Swaran Singh to persuade the Congress Parliamentary Party (headed by Chavan) to oppose the special courts bill. Instead she found that the Congress had permitted the conscience vote not only with the support of Swaran Singh as the party's president but also of Naik, Brahmananda Reddy, Subramaniam and others who were all championing the unity between the two Congress parties. Evidently, Swaran Singh and others failed to see the

point of Chavan's subtle move on the special courts bill. Indira Gandhi who was already sore with Reddy and Subramaniam for their deposition before the Shah Commission, was even more sore when she found that on the special courts bill also both of them had not only agreed to the conscience vote but also remained absent from the House during voting on the bill.

It was this which ultimately led Indira Gandhi to inform Swaran Singh, Naik and Patil that she could not associate herself with Reddy and Subramaniam — and many others — in the united Congress. She also told them that Siddhartha Shankar Ray should have nothing to do with the united Congress unit in West Bengal until he apologised to her son. She wanted all positions in the Parliamentary Party and at the state levels to be be decided by elections.

Chavan for his part made it clear to Swaran Singh that Indira Gandhi had lost her 'charisma'. According to him, Indira Gandhi only wanted to use the united Congress as an instrument to 'fight the Janata government's moves to prosecute her and her son. If the Congress allowed itself to be used this way, it would become a laughing stock in the eyes of the people. The people would certainly not come on the streets in support of Indira Gandhi and the united Congress would become an object of ridicule if it were to justify the Emergency excesses.

Chavan thus succeeded in securing his own political future in the Congress. He has already secured a Congress-Janata coalition in Maharashtra, and has even succeeded, through his friends in the Janata party in the state (Rajaram Bapu Patil) in installing a former, extremely lightweight Congressman, Baban Dhakane, as President of the Maharashtra unit of the Janata party in place of S M Joshi. Chavan has kept intact his relations with Janata party leaders like Chandra Shekhar, Krishna Kant, Madhu Limaye, unlike him Swaran Singh, Subramaniam, Siddhartha Shankar Ray and others have nothing to back them in their states.

BIHAR

Bonded Labour Astir

ALONG with the armed political struggle of labour and peasantry, a powerful agitation on the legal, economic front has also been going on in the villages of Bihar. While the political battle began in the mid-sixties the struggle on the economic front belongs to the seventies. Although the various groups of the CPI(M-L) are now coming to organise the labourers and peasants for partial economic struggles in some villages, in the majority of villages such struggles have broken out spontaneously, under independent local leadership.

One of the most significant and extensive of such economic movements in rural Bihar relates to the payment of minimum agricultural wages. From a little over 1,500 in 1968, the number of complaints filed by the agricultural labourers rose to over 12,000 in 1975 and is now supposed to average around 25,000 a year. The phenomenal rise in the atrocities against harijans is directly springing from a situation in which the labourers are taking up courage to demand proper wages, and other rights.

The first feature noticeable in the minimum wages movement is the crumbling of the myth that only the free workers can start and carry on a struggle against the village ruling classes. This movement has been, out and out, an uprising of the bonded labourers, with the free workers rarely fighting shoulder-to-shoulder with them. This failure of the free workers (chhuta mazdoors) to show solidarity with the bonded labourers (halwahas and bandhua mazdoors) has been one of the reasons why very few total strikes could be organised on the wages issue in the villages. In fact, the pattern of the bonded labour movement has been more akin to that of the peasant tenants (bataidars).

Apart from many reports in newspapers of the minimum wage struggles, facts about the movement can also be found in the Bihar government labour department documents. Invariably, the complaints filed at the labour inspectorate are for 'arrears of wages'. The free workers, who are engaged on daily basis, collect their wages after the end of their work and go home, it is the bonded labourers whose wages are deferred for payment by the landlords. Even otherwise, since the bonded labourers are usually paid at ancient rates there are always complaints about the non-payment of the differential between the wages they get (which itself is often deferred) and the wages fixed by the state government. The latest revision of minimum agricultural wages was done in December 1974, so the arrears are claimed from this date.

There are many factors which have encouraged the bonded labourers, more than the free workers, to rebel. The first has been the linking of wage issue with debt redemption. In practice it so happened that when a bonded labourer filed a complaint for arrears of wages, the landlord invariably turned him out of employment the labourer then stood firm about not repaying the debts. Secondly, owing to use of modern inputs the income of the landlords has

NUMBER OF COMPLAINTS, CLAIMS AND PROSECUTIONS FOR ENFORCEMENT OF MINIMUM AGRICULTURAL WAGES IN BIHAR, 1968-75

Source · Bihar Labour Year Book, 1976, Department of Labour and Employment, Government of Bihar.

considerably increased especially in the canal areas. Again it is the bonded labourers, more than the free workers who are usually engaged in peak seasons, who have felt the impact of a rising income for their masters and a stagnant remuneration for themselves. This is brought out in the fact that complaints about non-payment of minimum wages are most common in Patna, Purnea and the other (very few) canal-irrigated districts.

An interesting feature of the minimum wages movement has been that while thousands of labourers have been able to receive arrears of wages the general level of wages has hardly gone up in any area. There have been total strikes in many villages, with both the bonded and free labourers combining, but few of them have been successful in enforcing the new, revised wages which range between Rs 4 and Rs 5 plus a meal a day. In some areas, where the labourers of, say, a cluster of four villages have raised a demand for the new wages, a compromise of, say, three rupees, has been achieved. But this is much lower than what the government has fixed.

A direct result of the minimum wages movement has been the lesser incidence of bonded labour in the Bihar villages. Reports from different areas point to a general tendency among the landlords to do without bonded labour — that is, to get their cultivation done by the free workers on daily payment basis. Particularly the halwaha system, under which a landlord engaged a halwaha (ploughman) on a contract for a year or more, is slowly disappearing. The landlord derives other advantages too by doing away with engaging the halwaha in that he can cultivate for his own use the few kathas of land which he used to give to the halwaha for his use under the conditions of the contract.

Another effect has been the tendency among the smaller landlords to take to the plough themselves. This is particularly true of those belonging to the middle castes.

The government's policy regarding the minimum wages movement has been marked by many compromises. The labour inspectors are directed to try their best to 'settle' the wage complaints, with the labourers being induced to accept a much smaller amount of arrears than is legitimately due to them. The aim is to re-establish agrarian harmony. A majority of the wages complaints are thus disposed of by 'persuasive settlement'; for instance, in 1975, out of the total of 12,236 complaints filed, 10,831 were disposed of by 'persuasive settlement' and only 930 complaints went into claims. How government has been favouring the landlords can be seen in an instruction to the labour inspectors posted in the blocks, asking them not to proceed against any landlord possessing below 25 bighas or not having mechanised and organised farms. In order to avoid the ceiling laws the landlords have divided their holdings into small sizes so that they can always take advantage of this standing order. Under the section 20(2) of the Minimum Wages Act, if a landlord is prosecuted and found guilty of violation, he is liable to a punishment of six months' imprisonment or a fine of Rs 500 or both. There has been not a single case of a landlord booked under this provision anywhere in Bihar.

This Budget and Those

I S Gulati

THE 1979-80 Budget is the third presented by the Janata party government. It is thus the government's mid-term budget. How does this mid-term budget compare with the earlier two? What sort of things is the government seeking to continue? Where, if at all, is the government seeking to alter course?

Earlier Two Budgets

The 1977-78 Budget proposed an overall deficit of Rs 1,202 crores, which was artificially reduced by Rs 800 crores shown as borrowing against foreign exchange reserves. This enabled the Finance Minister to set himself a modest target of revenue to be raised through additional taxation. The budget proposed additional taxation of only Rs 130 crores. If that budget is remembered for anything, it is for the major concessions it allowed to trade and industry. These were: (a) the scope of the investment allowance was considerably widened, (b) closely held industrial companies were freed of the obligation to distribute excessive accumulation, (c) capital gains tax was abolished except in name, (d) amalgamation of sick with healthy industrial units declared as in public interest. The major item of additional indirect taxation was the raising of the rate of general excise duty from 1 to 2 per cent

The 1978-79 budget had projected an overall deficit of Rs 1,396 crores. This time no credit was taken for special borrowings against foreign exchange reserves. Additional resource mobilisation to the tune of Rs 55[illegible] crores was proposed. Of this, direct tax measures were to contribute only Rs 26 crores, from a graded disallowance of advertisement spending and another Rs 25 crores were to come from enhanced rates of compulsory deposits. The proposal for disallowing advertisement expenditure had to be considerably diluted by the time the budget was passed by Parliament. At the same time, however, interest tax payable by banks was withdrawn with a view explicitly "to stimulate productive investment". So there was in fact a net decline in direct taxation. The major effort was directed at indirect taxes which included (a) enhancement of the rate of general excise duty from 2 to 5 per cent, (b) enhancement of basic excises by 5 per cent, and (c) imposition of an electricity levy.

Thus it will not be unfair to say that the first two budgets of the present government added up to a distinct effort at creating as favourable a tax climate as possible for trade and industry. If additional tax revenue had to be raised, indirect taxes were tapped for the purpose, but the effort was largely to spread it thinly over the whole range of commodities rather to single out a particular set of commodities.

1979-80 Gap

The 1979-80 Budget, the present government's third budget, projects a deficit of Rs 1,975 crores, which it proposes to narrow down to Rs 1,390 crores with the help of additional tax effort and extension of the scheme of compulsory deposit by income-tax payers. So the third budget proposes to leave uncovered a much larger gap than the earlier two budgets, not only in absolute terms but also in relative terms, that is, when related to the gross national product at current prices for the year immediately preceding. However, when one compares the gap proposed to be left uncovered next year with the gap likely to occur in the current year on the basis of the revised estimates, *viz*, Rs 1,590 crores, the former is clearly smaller. But how does one vouchsafe that the estimated gap next year will not be exceeded as has happened in the current year? The fact remains that all the three budgets of the present government have opted to leave sizeable gaps uncovered.

The justification or permissibility of a budgetary gap derives from the macro situation that is likely to obtain in a particular year. In spite of a budgetary gap only three-fifths the size of that in 1978-79, the price rise in 1977-78 was of the order of 5 per cent compared to the price rise of 1 per cent in the following year. Clearly, there are several other components of the macro situation which one must take into account before one can say to what extent a budgetary gap can be accommodated.

A budgetary gap of given dimensions will, for instance, be easier to absorb for the economy when it is experiencing a larger, rather than a smaller, deficit in the balance of trade. The Indian balance of trade showed a deficit of Rs 692 crores in the whole of 1977-78; as against that, the deficit in just the first half of 1978-79 was as high as Rs 598 crores. Given the size of India's reserves held in the form of foreign exchange, there is no reason why it cannot budget for even larger deficits in its balance of trade. Evidently, the Finance Minister had some such thing in mind when he expressed confidence that, in spite of a gap of the size he was proposing, "we shall be able to maintain reasonable price stability in the coming year".

The much more significant aspect of the mid-term budgetary exercise, however, is really that, given the overall economic situation, a much larger gap was not left uncovered or, to put it somewhat differently, that it was considered politic to make the revenue-raising effort of the proposed level and in the directions indicated.

States' Share

It is necessary to underline one aspect of the revenue effort proposed for the next fiscal year, namely, the implications of the decision to accept the recommendations of the Seventh Finance Commission to raise the states' share of excise revenue from 20 to 40 per cent. Since excises have turned out to be the principal source of additional taxation, it means that for every hundred rupees required to cover the Central budgetary gap through additional excise taxation, the Finance Minister must hereafter propose to raise not Rs 125 but Rs 167. Thus of the Rs 455 crores to be raised from additional excise taxation, only Rs 262 crores would remain with the Centre to cover the budgetary gap. In an earlier budget, the Finance Minister could have appropriated for the Centre Rs 364 crores. Thus while out of the total additional tax revenue proposed in 1977-78, 23 per cent was expected to accrue to the state, the corresponding proportion for 1979-80 is estimated at 31 per cent. This latter proportion would have been a little higher if the Finance Minister had chosen to raise additional revenue from personal income taxation through the enhancement of basic rates instead of the surcharge. We have now reached a stage when the Centre's stake in personal income taxation has been reduced to such a dangerously low level, thanks to the successive Finance Commissions' refusal to see the point, that the Centre adopts other devious methods (surcharge is not the only such method;

the compulsory deposit is applied very remunerative method (which has been tapped already) to raise whatever additional revenues it wishes to raise, whereas it can strike generous postures in giving concessions the cost of which will be borne almost entirely by the state exchequers.

Higher Gross Tax Effort

Another aspect of the proposed revenue effort for 1979-80 is that the overall figure of net additional revenue raised conceals far more than ever before the revenue being foregone as a result of various concessions. The tax concessions quantified in the budget speech add up to Rs 130 crores. Thus additional tax effort, in gross terms, is of the order of not Rs 635 crores (after allowing for the taxes or enhancements which the Finance Minister has on second thoughts chosen to rescind) but Rs 765 crores and this figure does not include the Rs 160 crores on account of the extension of the scheme of compulsory deposits for income-tax payers.

The concessions offered in the 1979-80 Budget are interesting in themselves and bear some comparison to concessions offered in the first two budgets of the present government. As has been stated above, major concessions made in the first two budgets were clearly directed at trade and industry. Not that this time the concessions have been withdrawn from trade and industry. These concessions have been very largely retained intact, except for the withdrawal of the tax holiday for firms engaged in non-priority industries. But that this is a nominal action is demonstrated by the fact that no estimate is attempted of the gain to revenue from withdrawal of this concession. As regards withdrawal of exemption on capital gains, it is doubtful, going by the figures of assets which have changed hands in the past two years and gains which have been deposited in the exempt forms, that much remains now to capitalise. It may well turn out to be a paper withdrawal.

This time, the beneficiary of the concessions is unashamedly identified and he is the farmer. Even the major procedural reform, and certainly one of far-reaching significance as the Finance Minister claims, is directed at the farmer. This refers to the transfer completely of the formal burden of taxation from unmanufactured to manufactured tobacco, thereby relieving "at one stroke nearly a million tobacco growers, curers, small dealers and warehouse licensees from excise control".

Which Farmers?

The farmer has been a beneficiary already of Central and state largesse in the form of subsidies on food, fertilisers, power and irrigation water. The subsidies on food and fertilisers alone add upto Rs 1,010 crores in the 1979-80 budget. So far fertilisers subsidies were meant to cover the higher cost of imports; now even domestic fertilisers will cost less.

But the objectionable aspect of the proposed tax concessions is that, as for subsidies so far, no distinction is sought to be attempted between small and big farmers though it is well known that the former though very large in number (52 per cent) account for a very small fraction (8 per cent) of the total acreage. Even if some evidence has been unearthed to show that, in the case of some crops in some states, the small farmer has started using the same amount of fertiliser per acre as his larger counterpart, the major objection about the strongly regressive character of a blanket tax concession on fertilisers remains valid.

Though the concession on light diesel stands withdrawn, the fact that it was considered and included for the benefit of farmers with pumpsets driven by diesel engines should give a clear idea of the constituency being especially addressed. Last year, power-driven pumps were exempted completely from excise. To confirm one's suspicion, one has only to read the first part of the budget speech which singles out, among other things, a provision of Rs 10 crores for a scheme "for extending the subsidy on minor irrigation, given at present only to small and marginal farmers, to farmers whose holding is between 2 and 4 hectares, but at a reduced rate". The beneficiaries of the proposed subsidised storage facilities in rural areas will probably be even bigger farmers.

It is interesting that while the increases in duties on petroleum products were justified on the grounds of conserving foreign exchange, and quite understandably so, this consideration could be brushed aside in the case of light diesel but not kerosene which is possibly still the main source of lighting in the vast majority of rural hamlets, all the crores spent on rural electrification notwithstanding.

With all the subsidies the medium and large farmers were already enjoying, that the government should have considered it desirable to extend them further concessions invoking the cause of agriculture and rural development unmistakably points to its bias, which is certainly not in favour of the vast multitude of marginal and small farmers, leave aside the usually forgotten landless, whatever their caste or community.

I should not close without referring to a few specific proposals in the budget package, which, though not particularly significant from the point of revenue, seem to me to deserve attention. I have in mind here (1) the liberalisation of the export market development allowance and (2) restricting the income tax concession available on long-term savings. In regard to both of these, in 1979-80 budget attempts to reverse the 1978-79 proposals.

The 1978-79 proposal was to discontinue the weighted deduction with respect to export market development expenditure. This year, not only is the weighted deduction being restored but also the privilege is being extended to all tax-payers, corporate or non-corporate. The justification offered is that this will enable exporters to develop export markets on a long-term basis.

In other words, the government is clearly not only in favour of continuing the existing massive subsidies on exports (the revised estimates for 1978-79 place them at Rs 380 crores) but also of liberalising them further, all in the name of developing exports on a long term basis, in addition to the policy of continuing devaluation of the rupee that the confidential basket method of fixing the exchange rate has entailed. Apart from the consideration that subsidisation can never be considered a permanent feature of a fiscal system, this also raises serious questions about the policy of the country that seeks to secure larger and larger export earnings only to pile up foreign reserves.

Even those, including myself, who have for long pointed out the regressive, non-rural bias of the income-tax concession on long-term savings cannot quite understand why even the restricted concession cannot be so restructured that the marginal rate of tax benefit, to the extent it is available even to a high income saver, cannot be made to rise *pari passu* with increase in long-term savings. While one may, therefore, be in sympathy with the spirit behind what has been attempted, the procedure adopted is difficult to accept.

AVANTI
Leathers Limited

HISTORY AND BUSINESS

AVANTI Leathers Limited was incorporated on 17th March, 1976 and obtained the Certificate of Commencement of Business on 5th May, 1976. The Company has an Industrial Licence for the manufacture of 1,50,000 pieces of finished leather from hides, 18,00,000 pieces of finished leather from skins and 1,20,000 pieces of chrome splits for lining counters.

PROJECT

Location

The Company is setting up a new project for manufacture of finished leather from hides and skins and chrome splits for lining counters at Kambakkam Reserve Forest, near Varadayyapalam Village in Satyavedu Taluk, District Chitoor, an industrially backward area in Andhra Pradesh. It is however only about 80 kms away from Madras and is linked by road and rail. The Company will be able to utilise the benefits of market proximity to Periampet in Madras, which is the principal leather market in India.

Cost and means of financing

The total cost of the project is estimated at Rs. 240 lakhs as under:

Items of Expenditure	Amount (Rs. in lakhs)
1. Land and site development	5.30
2. Buildings	43.26
3. Plant and Machinery (including installation charges)	*89.00
4. Miscellaneous Fixed Assets	33.66
5. Preliminary Expenses	3.48
6. Pre-operative and start up expenses	24.70
7. Provision for contingencies	9.86
8. Margin money for working capital	30.74
	240.00

* Includes Rs. 46.30 lakh rupee equivalent of foreign exchange

Sources of Finance

The cost of the project is being financed as follows:

Sources of Funds		Amount (Rs. in lakhs)
1. Equity Share Capital		75.00
2. State Subsidy		10.00
3. Term Loans from:		
IDBI	75.00	
ICICI	40.00	
IFCI	40.00	155.00
		240.00

Present Status

The Project is in advanced stages. Civil construction has almost been completed. Plant and machinery, both imported and indigenous have already arrived at the site and are being commissioned. The trial production is expected to commence by April 1979, barring unforeseen circumstances.

PROMOTERS

AVANTI Leathers Ltd. has been promoted by Sarvashri K. Ranga Rao, A. Venkateswara Rao and Nava Bharat Enterprises Private Ltd. (NBE) along with its associate concern, Nava Bharat Ferro Alloys Ltd. (NBF) and persons connected with Popular Shoe Mart.

NBE is a fairly large export house with a network of branches all over India, dealing in leather goods, ready-made garments, spices, tobacco, cigarettes, etc.

BUSINESS PROSPECTS AND PROFITABILITY

The prospects for finished leather industry of India are good. In view of the good demand for finished leather both within the country and outside the country, the Directors are of the opinion that barring unforeseen adverse circumstances, the Company would earn such profit as would enable it to declare reasonable dividend within reasonable period after the plant goes into commercial production.

AVAILABILITY OF FORMS AND PLACES OF ACCEPTANCE

Application forms with copies of the Prospectus may be obtained from the Registered Office of the Company, underwriters, brokers to the issue and bankers to the issue as stated above and in the application form.

All application forms duly completed together with cash/cheque/bank draft should be delivered before the closing of the subscription list to any of the bankers to the issue named herein or to any of their branches, a list of which is given above and incorporated in the application form, and not to the Company or to the Managers to the issue or to the Registrars to the issue. For further instructions, please read the application form carefully.

Soviet School System : Problems and Prospects

R G Gidadhubli

ON July 1, 1978, the All Union Congress of Teachers in the Soviet Union concluded its four day session in which 4,000 representatives of 4.5 million teachers from various parts of the country participated.[1] That this Congress, held after a decade, was not just an ordinary one was evident from the fact that it was inaugurated by Leonid Brezhnev himself and that the minister of education of USSR and of union republics, eminent professors, pedagogues and social scientists actively participated in the deliberations. The CPSU and the Soviet government reminded the teachers that "the major task of the schools in the present stage is the systematic realisation of the decisions of the XXV Congress of the CPSU about further development and perfection of people's education, increasing the effectiveness and quality of teaching, upbringing of pupils and preparing them for life and labour".[2]

On the academic front, Soviet achievements in education are remarkable — eradication of mass illiteracy in a short period, vocationalisation and polytechnisation of education and placing the country on the high road to scientific and technical progress. During the decade since the last Congress, the period of minimum compulsory education for every student in the country has been raised from eight years to ten years. During this period, seven million young workers who did not get complete secondary education were reported to have accomplished it through evening schools and correspondance courses. About 9,000 secondary schools were opened in rural areas during this period which works out to about three schools per day. All this confirms the fact that school education has received and continues to receive high priority in the Soviet Union. The Soviet Union has long realised that education has a direct bearing on economic development; labour productivity of a worker with complete secondary education is presently estimated to be 25 per cent higher than that of a worker without it.

Although the number of students in schools (primary, general secondary and professional) has remained more or less constant at 48-49 million since 1965-66,[3] the number of students in evening schools, correspondance courses, professional and specialised schools has registered marked increase while that in general secondary schools has showed some decline. New forms of specialised schools known as "Inter-school Production-Pedagogical Combines" have come up since 1975 whose aim is to enable more efficient and economical training of students for a wide variety of professions taking into account the requirements of large enterprises located in the area. The participation of representatives of industrial and agricultural enterprises in the deliberations of this Congress, therefore, was not without significance. They not only extend help to technical schools in the form of funds and supply of modern equipments for practical training, but also take active interest in bringing a close link between production and schooling.

Soviet schools are not without problems; the CPSU itself has given a call about the need to improve the quality of education to the teaching community as a whole. This might have been particularly addressed to those in charge of education in rural areas since the standard of education there is much lower than in urban centres. Studies conducted some years ago indicated that lack of good education facilities for the children was one of the reasons for large scale migration from rural to urban areas. The latest information that 9,000 secondary schools were opened in rural areas in the last decade and that school buildings to serve the needs of nine million pupils were built confirms that adequate education facilities were lacking in rural areas till recently. Leonid Brezhnev seems to have taken particular interest in providing good education facilities in villages.

Another problem facing education in the Soviet Union is that relating to specialisation in technical education. Students are trained in polytechnics for hundreds of specific jobs in the economy. In view of the fast progress in science and technology certain jobs may become redundant with changes in any particular production process. This requires retraining of such workers for other jobs involving loss of labour days, besides raising problems of their dislocation on a large scale. Soviet experts are considering the "possibility and even necessity" for launching the training of specialists of broad specialisation, capable of quickly switching over to new and improved lines of production".[4]

More than curricular aspects of education, the discussion in the Congress was concentrated on the problems of upbringing of children. Ideological orientation is specific to the Soviet system of education. The objectives of Soviet schools are not only the transferring of knowledge to students but the instilling in their minds of the high moral values and ideals of Communist philosophy. Hence Soviet teachers carry a great responsibility for ensuring the proper upbringing of children.

Since there is nothing new in such a perception of the role of Soviet teachers, why was this aspect emphasised so much in the Congress? Although the upbringing of new generations of students is a continuous process, one strong possibility is that the work carried out so far has not been satisfactory enough, in the opinion of the leaders, to be complacent about it. The process of social and cultural revolution which alone can bring about true socialist consciousness is still in progress. The period of six decades since the October Revolution is not perhaps long enough in the history of a country to enable the elimination of all elements of the pre-revolutionary society which are alien to a socialist society For instance, according to Soviet political scientist G Glezerman, personal subsidiary farming which is economically necessary affects the psychology of the collective farmer and may slow down the elimination of the survivals of private property mentality.[5] Similarly, individual nature of the labour of some categories of the intelligentsia belonging to liberal professions may also retard the elimination of remnants of individualism.

Soviet society has achieved considerable success in meeting the material needs of the people and in creating the objective conditions for their cultural and spiritual upliftment. This is evident in the desire of the people to take greater interest in fine arts, literature and sports. At the same time Soviet leaders and scientists are aware that anti-social traits such as drunkenness, petty hooliganism etc, have to be fought against on all fronts and they may not spontaneously get eliminated under socialism. Education can play a very important role in this regard.

Besides this, the impact of the capitalist world hinders the elimination of

capitalis[illegible] members [illegible] society. The Soviet people have been more exposed in the recent period than in the past to the influence of the developed Western societies and it is possible that the glitter of the West may dazzle those who are insufficiently staunch ideologically. Soviet leaders and social scientists are aware that it is not realistic to hope that the consciousness of people will be renewed of itself and that anti-socialist phenomena will wither away without rigorous struggle against them. Hence they are calling upon the schools to lay greater emphasis on moral and ideological upbringing of children in the spirit of collectivism, industry and humanism.

In this connection one point is worth noting. According to Soviet Educational Law, 1973, organisations such as Komsomol (Young Communist League), Pioneer and Trade Unions help teachers and families in the work of upbringing of children outside schools.[6] In last year's Congress, the role of these organisations did not seem to have been evaluated and discussed despite the fact that one of the major thrusts of the deliberations was on the task of upbringing children. It is not clear why teachers alone should have been singled out for any 'failures' in the task of upbringing of Soviet students.

Similarly, the question of socialist attitude to work is equally important and is an inseparable part of the overall process of upbringing. Considerable attention is given in the Soviet Union to create better environment for work, especially those kinds of work which are to be carried out under difficult conditions such as in mining, work in heavy industrial establishments, and so on Efforts are also made to mechanise many operations which involve hardships and physical risks. However, at the present stage of development, the level of mechanisation and automation is lower than in the developed capitalist countries. Soviet scholars, categorically refuting the Western criticism that under Socialism 'individuals live in order to work', contend that work and life are not opposites. According to socialist philosophy, work is an integral part of life of an individual and that it has social significance. What is more, work turns labour into creative endeavour whereby he can display his capabilities and talents.

However, the attitude to work is not entirely satisfactory. In fact, deep concern was expressed by speakers in the Congress about the need to improve the individual's attitude to work. "Serious shortcomings are there in the instruc[illegible]tion of labour and upbringing of school children. It is necessary that the subject of labour, greatness of people of labour resounds in all lessons and in upbringing activities."[7]

Therefore, the Soviet leaders are calling upon teachers to further improve teaching of labour, particularly in higher standards, in their own workshop hours, in their practical training at enterprises, in inter-school pedagogical production combines and in student agricultural brigades. The need for such efforts can be seen, for instance, in the case of agricultural training schools where, after completing training which the state farms and collective farms finance, there is a tendency on the part of some students to seek jobs in towns. Similarly, among those completing general secondary education, there is a strong desire to go for higher education, although hardly one among four students can get admission to higher educational institutions. This general tendency was corroborated by a study conducted by Novossiberian sociologists.[8] The youth revealed a high preference for jobs of engineer, physicist, pilot and a very low preference for the jobs of lathe-operator, tractorist and salesman.

Man's attitude to work is a very complex one. Bringing about a harmonious union between the interest of the individual and the interest of society is a very difficult task. Many measures have been undertaken by the Soviet Union to create objective conditions for achieving such a harmonious union. Efforts are still going on in that direction, especially in certain spheres of economy such as labour organisation, distribution and remuneration which may help in overcoming the temptations still not overcome by the Soviet worker — the satisfying of personal interests at the cost of social interest.

For improving education, it is not enough to improve the organisation of the system but to improve the teacher as well. Marx visualised the tremendous problem of creating and moulding a new man with Communist consciousness when he stressed that, first of all it was "essential to educate the educator himself". While complimenting the delegates at the Congress for their significant contribution, the Soviet minister for education observed that "Pedagogical institutes and universities often weakly prepare their students for upbringing tasks". It was observed that those in charge of individual pedagogical groups had not achieved active positions in life. It was also noted that among certain students, there were elements of social passiveness, demanding nature to life, and [illegible] which could be explained only by the problems of upbringing on the part of teachers.

Similarly, the director of a school from Riga urged for cohesion among the collective of teachers who should single-mindedly dedicate themselves to their task. According to her, to be a good pedagogue, what was more important was an amiable personality, wideness of intellectual horizon, depth of knowledge and high moral quality.

To conclude, Soviet school system is entering a crucial stage in the development of Soviet society. In the curricular field, the Soviet Union has launched a campaign for compulsory ten years schooling. While the number of students in general secondary education has declined marginally, the number of students in technical schools and evening schools has increased indicating the continuation of the process of vocationalisation and polytechnisation of education. Problems of qualitative improvement, particularly with respect to rural schools and the nature of specialisation of technical education, are being solved.

However, more than the curricular aspect, the ideological upbringing of pupils seems to be worrying the Soviet leaders today. There is a tendency among some students to choose careers which involve more of mental labour than physical labour. Besides promises of higher pay, such careers have also a certain 'prestige value'. The solution to all these problems lies in the proper upbringing of children in the spirit of communist philosophy. The Soviet leaders have called upon the teachers to make further efforts in achieving this task.

South Korea : The Entrepreneurial State

John Ashdown

SOUTH KOREA is a land of the economic spectacle: an annual ten per cent rate of growth since 1962 (and a breathtaking 40 per cent rate of growth of exports). In the miracle year of 1973, national product grew by nearly 17 per cent. Even in 1976, when the rest of the world was still groggy from the battering of 1974, Korea expanded its national product by 15.5 per cent, and its exports — expected to increase 22.5 per cent under the Third Plan – clocked a cool 45.9 per cent. Total value of exports crossed the symbolic frontier of US $10 billion in 1977 (all money figures are in US dollars), ahead of schedule for the target of $22.8 billion by 1981 The per capita income crossed the threshold of $1,000 last year (from a base of $87 in 1962, current prices), again ahead of the timetable. the 1981 target: $1,936.

If that is not enough to dazzle the most jaundiced banker, disaggregate the figures. Exports have been transformed so they are now overwhelmingly manufactured goods and not raw materials. The star performer in the 1960s, electronics, expanded its output between 1964 and 1970 by 51 per cent per year (and its exports by a staggering 102 per cent, three quarters of it from foreign owned or joint venture companies). The government may seem ambitious in plan targets, but the economy has consistently defied the conservatism of the planners; in 1976, the output of television sets exceeded the targets by three times over.

Heavy industry is now expanding very rapidly. About 43 per cent of exports are already in the heavy end of production (basic metals, shipbuilding, petrochemical products). The government aims to move out of mass produced light industry towards 'custom built' heavy machinery. Businessmen now boast of their exports, not of cheap shirts, but of textile machinery, of a zinc refinery to Thailand, a paper factory to Colombia, a soda ash plant to Peru, a pulp plant to New Zealand.

Korea Inc

How has it been done? Formally, by playing the film of Japan's economic history very fast. In practice, through a series of gambles, deliberately using the fierce winds of the upper atmosphere of world trade to drive the Korean kite higher and higher.

The tactics required tight central direction — an Entrepreneurial State, knocking everyone into one line. The planners instruct business on targets, type of output, markets, type and rate of expansion of capacity, and insist in inspecting the quality of output. Private companies are in effect subsidiaries of Korea Inc. Most companies depend very heavily on borrowing from the banks, and the government is the major shareholder in all the leading banks. The targets are thus 'indicative' only in the loosest sense. President Park meets the dozen or so *zaibatsu* of Korea, heads of the government-designated 'General Trading Companies' (and particularly the Big Three: Hyundai, Daewoo, Samsung) once a month to plan the next battles in the conquest of world markets. By a mixture of bribery and bullying, the army advances.

The bribery consists of export incentives adding, some said, ten per cent to the return to the exporter. It includes massive public finance to key sectors (70 per cent in heavy industry and shipbuilding?) and, if they flounder, a government financed safety net. While the rest of the world's shipbuilding industry is crumbling, little of Korean capacity has so far been closed. The government's direct expenditure backs up its targets — the building of roads, power stations, ports and the rest are ruthlessly subordinate to the export task. The land is now dotted with industrial colonies, islands of exceptionally high standards of industrial infrastructure, where business may thrive without the painful presence of the rest of the country. The government similarly holds at bay any who object — critics, students, workers — lest such objections disturb the tempo of expansion. It starves the domestic market so that more is available for the foreigner. And above all, it uses all means to drive up and sustain the profit rate. Korean companies tend to pay out a 40 per cent profit to lenders. US banks have just announced profit rates for their Korean operations between 1974 and 1977: 72 per cent; 114 per cent; 126 per cent; and 95 per cent (or about $200 million).

Spectacular Gambles

Under the Fourth Plan, the government aims to make Korea a major heavy industrial country. Steel output [illegible] ting from under 1 million [illegible] 1), most of it from one major State plant at Pohang — is to reach [illegible] million tonnes by 1981. The government has just announced that it will begin work on a gigantic new plant of 12 million tonnes. 100,000 tonnes of ethylene, the raw material of petrochemicals, is now streaming out of Korea's first naptha cracker; 350,000 tonnes comes from a second, and now there is talk of a third, each one the core of a giant petrochemical complex. Shipbuilding has come from nowhere in the 1960s (capacity: 20,000 gross tonnes) to 700,000 tonnes capacity in 1976. The government aims to raise its present 2-3 per cent of total world capacity to 10 per cent by 1981 (when it will be the second largest shipbuilder in the world after Japan) Vehicles – with a current capacity of 220,000 units per year — are ultimately projected to reach a capacity of 2 1 million units (with 900,000 exported).

This is heady stuff. It is a part of a series of spectacular gambles to ram South Korea into modern industrialisation. The heavy industry gamble is that, if Korea can expand fast enough, it will elbow aside existing producers without them counterattacking. A similar gamble came off in 1974-75 when the rest of the world economy tumbled in a heap. President Park calculated that if Korea kept up the pace, it could win a larger share of a declining market. And it did, thanks to the massive backing of international banks (fuelling Korean growth with a billion dollars a year), the restocking mini-boom of 1976 in the United States, and Korea's flair for switching the points on the oil price "shokku" of 1974 In West Asia Koreans went hunting for export orders and building contracts, and the efforts of the 60-70,000 Koreans currently in that region brought home some $4 billion in the first half of 1978

But heavy industry is a much more ambitious gamble than this. The whole world economy is overshadowed, according to business, by 'excess capacity' in shipbuilding, steel, ethylene and vehicles. Where the growth of the world market is small, South Korea's expansion can be wrecking. How long can the subsidies last without a real expansion in world demand? Korea plans on a giant scale to reap the benefits of economies of scale; but then the domestic market is far too small to take more than a trivial share of the minimum economic output; and dumping abroad is the only way to minimise losses. Just when everyone else is dump-

ing, the advanced [illegible] are [illegible] driven to cut to size any newcomers from the world economy.

In cars, it is said Korean production costs are, because of the still small scale of output, a third higher than the equivalent Japanese model, but their export price is lower. The domestic market is squeezed by heavy taxes (300 per cent on petrol, a stiff monthly road tax, a 40 per cent purchase tax on cars) to force exports. Yet even so, the industry utilises only about a third to a half of its existing capacity. In shipbuilding, reality forced a rapid scaling down of ambitions from the Third Plan's promised nine new shipyards (each with capacity to build giant tankers) to three. Even then, only a quarter of the capacity is being used, and the yards can only be kept open through public finance (in 1976-77, there was the first absolute drop in output, of six per cent).

Riding for a Fall

In the past, there was always a saviour. US aid, equivalent to a quarter of Korea's imports in the last half of the 1960s, fuelled the first burst of growth. The Viet Nam War gave another boost — $200 million for the use of Korean troops, big orders for ships from Hyundai and equipment and other supplies (since Japan's exports to Viet Nam were limited by US quotas, enterprising Japanese slipping into Korea to use the Korean quota). The State itself saved business in the recession of 1971 And in 1975-76 the US market and Korean enterprise in West Asia saved the day.

But Korea was *not* then biting into the markets of important industries in the industrialised countries. Textiles is one thing, steel, shipbuilding, cars and petrochemicals something different again Korea is very vulnerable since its target exports cover a range so narrow as to maximise potential instability. Now the combination of low wages (the lowest in East and Southeast Asia except for the Philippines and the People's Republic of China) and a depreciating currency (the Won is tied to the US dollar and has therefore lost a quarter of its value against the yen in the past year) continually hone the razor of exports. Without world expansion, excess capacity and a very top heavy debt structure could swamp Korea

Korea, from one viewpoint, is no more than an offshore exchange between Japan and the United States. Crudely, Korea imports raw materials (much of them from the US), uses Japanese machinery to work them up, and exports the results to the United States (and now Europe). The results are a large surplus on Korea's trade with the United States, and a giant deficit on trade with Japan. Looked at in another way, Korea's surplus on trade with the US should be included as part of Japan's enormous surplus on its US trade. Korea's exports may be dynamic, but they are matched by the dynamism of its imports from Japan (despite the rise of the Yen); imports from Japan increased 61 per cent in the first half of 1978, compared to the first half of 1977.

There are other sharks snapping at Korea's feet. Revenue from West Asia has pushed up domestic inflation (running at about 28 per cent on an annual basis at the moment). The government is temporarily liberalising some imports to try to mop up excess liquidity, and limiting new West Asian contracts. The emigration of skilled workers has pushed up skilled wages rapidly. If it continues, rising skilled wages could pull up unskilled wages and Korea could bang against the limits of its labour supply. That would make Korea less attractive for foreign capital (currently, foreigners have about a third of direct investment, 82 per cent of it American or Japanese, and foreign companies have a much larger share of key export sectors), and increase the tendency for foreign capital to go elsewhere. If China really does open its doors to 'export processing zones', that could provide all the advantages Korea offers and more.

Sometimes some businessmen grumble about Korea's 'premature' heavy industrialisation. With the domestic market so small (and kept deliberately small by the government), and the world overhung by such excess capacity, the wisdom of the government is not beyond dispute. Military imperatives — the need for military self-reliance in the face of the US evacuation of Korea — took priority over what might seem good business. If the world economy fails to expand, the alliance of State and business could come under stress. That could connect to the still continuing opposition to Park. No one knows how long Koreans will tolerate being obliged to meet Japanese standards of productivity at under a third of Japanese wages.

The Fortress State

The hard-faced robber barons of early Victorian capitalism might feel, if they came upon the world of 1978, that Korea's businessmen were their spiritual heirs. They would recognise the heady mixture of gamble, frenetic work, spectacular growth of output and profits.

But they would be wrong. The central drive behind Korea's growth is not the unrestricted pursuit of profit, but the State's obsession with 'defence against what President Park sees or chooses to see as the permanent threat of invasion from the North (North Korea's population is about half that of the South). The US decision to evacuate the South has given Park the entire justification for his policies.

South Korea has 595,000 men and women under arms (the fifth largest military force in the world, but with only 36 million people in the country). There are 1.2 million in the reserves, 2 7 million organised in paramilitary forces, backed up by universal conscription. Perhaps more than half the budget in fact (rather than in the published figures) goes to the defence sector, and much more if we include as part of defence the drive to heavy industrialisation to achieve military independence from imports. Without this appalling drain on resources and manpower, presumably the economic growth rate would be doubled!

It is defence — the 'threat of the North' — that is the justification for the State's ruthless dedication to the work ethic, policed by 20,000 agents of the notorious Korean CIA, backed by an alleged 50,000 informers. You can see the work ethic in the sweatshops of the back streets, workers groping to work in the dawn light, returning in the dark exhausted. You can see it in the tired faces of school students, stumbling home with heavy satchels at eight and nine in the evening. The ILO, in a survey of sixty countries, gives Korea the doubtful prize of the longest working week in the world: an *average* of 57.7 hours.

It is national security that supposedly justifies the heavy burdens imposed on the mass of taxpayers required to subsidise steel prices, to bribe exporters, to bail out sinking companies, as well as pay for the President and his armies. It is defence also which gives President Park his rationale for the political butchery of all opposition, the notorious hunting down of critics, the savage sentences on demonstrators (among those arrested in the opposition to Park's new constitution in 1973-74, 14 received death sentences, 15 received *life imprisonments*, 26 were sentenced

in jail for 15-20 years), and the well documented accounts of torture by the KCIA. North Korea is the apparent reason for creating a tame assembly, for the rule that criticism of the President or his constitution is liable to fifteen years imprisonment, for the reduction of the press to remasticating government handouts. Periodic scares are released to stiffen the backbone of terror, to encourage a paranoia that obsesses President Park — no one must take photos in the direction of his Blue House; no windows may face or overlook it; the President travels rarely, and then surrounded by an armoury.

It is similarly supposedly defence which vindicates the ruthless pursuit of low wages while profits soar. The government boasts that wages are low. But by 'low', the government means $120 per month. In fact, some sources claim that three quarters of the labour force received $60 or less per month, and for this they often work 18 hours in appalling conditions. There are stories of 12 and 13 year old girls, working endlessly in the dark of wet cellars. The opposition claims that 12 per cent of workers are on or below starvation wages, not difficult when the Bank of Korea calculates $170 per month as the minimum household subsistence income. The textile industry employing three quarters of a million people (mainly women receiving 44 per cent of the average male wage) pays about $80 per month.

But the picture is very mixed. The scarcity of skilled workers has widened the differential between skilled and unskilled, as well as between manual and white collar, workers. Permanent workers in large companies are much better off than those in small enterprises or subcontracted to big companies (and subcontracting is a major element in big company employment). In Hyundai shipbuilding, it is said that permanent workers get $ 380 monthly for a 48 hour week (and exceptionally good working conditions), and technicians a top rate of $680. That says nothing of managers and owners. Many of the peasants in the more fertile areas have benefited from a rice price support scheme that has narrowed the urban-rural income gap remarkably.

But the majority of Koreans are on low wages, the real value of which is continuously cut by inflation which is currently 28 per cent. There have been large money increases in recent years, but it is not clear they have made up the difference. In the 1970s, real wages in manufacturing are said to have increased 7-8 per cent; but the real wage index (1961:100), some sources allege, now stands at 83.

Suppressed, but Restive, Labour

West Asian employment for Koreans is theatening to wreck the wage system. The masses of workers who pack the thrice weekly flight to Bahrein earned $ 4 billion in the first half of 1978. But the resulting shortage of skilled labour in Korea has forced the government to allow substantial pay increases to try to nail down those still left. Pusan bus drivers recently received a 70 per cent pay increase. It did not work, and in May, Park was obliged to ban temporarily the recruitment of Koreans for work abroad. On the other hand, Korean agitation in Iran against low wages obliged Park to enforce a minimum pay level of $480 per month (of which workers are obliged to return 80 per cent to Korea). So a kind of auction is developing between the West Asia and home pay rates, the West Asian pay being influenced by the pay being received by Europeans and Americans. Still Koreans cost a third of what their competitors charge, and because they work 24 hours a day, they can complete contracts far faster. That was a factor in the gigantic contract for Jeddah airport which the Koreans won in the face of stiff competition from everyone else by promising to complete the project in four months.

Low wages or not, enough people have stable employment to transform Korea's lifestyle. Babies are plumper than ever before, and people are well dressed At twilight in Seoul's department stores, the air rings with the sound of tills and the clack of the abacus. Food is plentiful But still for the majority, life is austere. The government strives to keep it that way — by curbing pay increases for the unskilled, using all the force of the State to suppress strikes, by making no efforts to damp down the effects of inflation in key consumer prices.

The government also shows uncharacteristic inertia over questions of improving the social wage: There are no unemployment allowances, and very little medical or retirement benefits. In contrast to the heroic production targets of the Fourth Plan, the aims of social welfare are modest indeed: of Korea's labour force of 13.4 million, by 1981 2.5 million will be covered by voluntary medical insurance; 2.8 million will be getting old age pensions; and 2.8 million to compulsory accident cover. Safety standards in the factories are notoriously low, even in some of the most modern enterprises (last year, 11 men were killed in Hyundai's Ulsan shipyard, the most modern in the country). Nor are companies seriously obliged to protect Korea from pollution, although regulations and propaganda exist. A British observer noted that some of the tributaries of the Han river (which flows through Seoul) had levels of organic pollution double that in a London sewer; copper contamination was twenty times the permitted WHO level, and lead contamination, 80 times.

The same deficiencies are vividly apparent in housing. At least government has graduated from its first appalling response to slums when it just lifted thousands out of Seoul by force and dumped them miles from anywhere to fend for themselves. Riots ensued, and government ultimately developed a less disastrous approach. But even so the housing shortage is extreme (and price inflation spectacular), despite the serried ranks of 'battery hen' blocks south of Seoul. An estimated 49 per cent of Pusan and 47 per cent of Seoul families have no independent home of their own, and a fifth of Seoul's people are in 'illegal' housing. Under the Fourth Plan, efforts are being made to increase the housing output to a target of 1.3 million units; but since there is not much subsidy on housing the houses will not reach those in most need.

Koreans are no more passive in the face of these problems than other people. The students persistently voice their demand for a democratic constitution, despite an amazing scale of repression (the demonstration last October was preceded by mass arrests). Women textile workers in Inchon have been engaged in a longstanding battle to establish a better deal; they also go in and out of jail, bearing the marks of the regime's policy on their skin.

Not so long ago, the Shah of Iran could afford to be complacent, coasting along on high growth. Perhaps from the eyrie of the Blue House, President Park contemplates the sombre lessons of Iran's recent history. If he does not, if his obsession with military conflict with the North remains the single principle of Korean growth, he too may find himself experiencing the Shah's nightmare or meet the fate of another famous Emperor, Hailie Selassie.

Lewis Model on a World Scale

Ranjit Sau

The Evolution of the International Economic Order by W Arthur Lewis; Princeton University Press, 1978; pp 81.

REMEMBER that cute 1954-model of Arthur Lewis?[1] A dual economy with two sectors: one traditional, the other modern. The former produces food-grains, and it has a practically unlimited supply of labour at a constant wage rate determined by the average yield on agricultural land. The modern sector draws labour from that reservoir of cheap supply. The economy does not get into the path of rapid development until and unless the traditional sector empties its surplus labour or improves its productivity.

Blow it up on the world scale, with a few modifications. China and India, from where fifty million indentured labour emigrated in the first half of the nineteenth century, constituted the source of cheap labour for the advanced countries. What is known as the Third World today is thus historically the traditional sector of the Lewis world model. Wages are low here as the yield on land is scanty. And this has had far-reaching implications.

When in the nineteenth century the industrial revolution crossed into several countries in Europe and elsewhere, the Third World was bypassed. Agricultural productivity being low, the surplus was meagre, and hence there was no domestic market to support industrialisation. As Lewis puts it: "Agriculture has to be capable of producing the surplus food and raw materials consumed in the industrial sector, and it is the affluent state of the farmers that enables them to be a market for industrial products. If the domestic market is too small, it is still possible to support an industrial sector by exporting manufactures and importing food and raw materials. But it is hard to begin industrialisation by exporting manufactures. Usually one begins by selling in a familiar and protected home market and moves on to exporting only after one has learnt to make one's costs competitive" (pp 9-10).

What is more, in the Third World countries the political power in those days was wielded by the landed aristocracy who opposed industrialisation.

And so, in the first half of the nineteenth century, the world divided: countries that industrialised and exported manufactures, and other countries that exported agricultural products.

And so the Lewis world model unfolds. But does not Lewis contradict himself right from the beginning? If there were no adequate agricultural surplus to support its own domestic industrialisation where did the agricultural surplus for export of the Third World come from?

Second, consider the issue of home market. During 1876-80 the average annual world exports of manufactured articles was $ 2.29 billion, of which more than half was imported by the countries of Asia, Africa and Latin America (and Oceania), namely, $ 1.29 billion. The annual figures for 1896-1900, 1913, 1928 and 1937 respectively are as follows: world exports $ 3.23 billion, $ 6.93 billion, $ 12.91 billion, and $ 9.88 billion; imports of Asia, Africa, Latin America (and Oceania) $ 1.60 billion, $ 2.95 billion, $ 5.98 billion and $ 4.99 billion.[2] How can one say that the home market was too small to initiate the process of industrialisation in the Third World? Average farm productivity might be low, yet the total production could be sizeable, and so also the surplus. The distinction between average and total is quite clear.

Third, true that the landed interests were at the helm of political affairs. It is conceivable that they might not be too enthusiastic about industrial development. But Lewis does not explain why they did not care to improve agricultural productivity and surplus, either.

Comparative Costs

Lewis continues. Since the yield on land in the Third World is low, wages are low, and therefore so are the prices. He even cites it as the cause for the exploitation of American blacks. "American blacks earned so little because of the large amount of cotton that would have flowed out of Asia and Africa and Latin America at higher cotton prices" (p 17). The logic is getting curiouser and curiouser; isn't it?

Now the Lewis model of unlimited labour supply is grafted on to the Ricardian theory of comparative costs. The "stream of migrants from Asia [to work mainly as indentured labourers in the tropics on plantations, in mines, or in construction projects] was as large as the stream from Europe [into the new countries of temperate settlement: Canada, Argentina, Chile, Australia, New Zealand, and South Africa] and set the level of tropical prices. In the 1890s the wage of a plantation labourer was one shilling a day, but the wage of an unskilled construction worker in Australia was nine shillings a day. If tea had been a temperate instead of a tropical crop, its price would have been perhaps four times as high as it was. And if wool had been a tropical instead of a temperate crop, it could have been had for perhaps one-fourth of the ruling price".

This analysis, continues Lewis, clearly turns on the long-run infinite elasticity of the supply of labour to any one activity at prices determined by farm productivity in Europe and Asia, respectively. This is applied to a Ricardian-type comparative cost model with two countries and three goods. The fact that one of these goods, food, is produced by both countries determines the factoral terms of trade, in terms of food. As usual one can elaborate by increasing the number of goods or countries, but the essence remains if food production is common to all.

This is an ambitious hypothesis. Lewis wants to explain with it the pattern of world economic development. Given the difference in factoral terms of trade, he argues, the opportunity that international trade presented to the new temperate settlements was very different from the opportunity presented to the tropics. Trade offered the temperate settlements high income per head, from which would immediately ensue a large demand for manufactures, opportunities for import substitution, and rapid urbanisation. Domestic saving per head would be large. And so on. The factoral terms of trade available to the tropics, on the other hand, offered the opportunity to stay poor — at any rate until such times as labour reservoirs of India and China might be exhausted.

A farmer in Nigeria, observes Lewis, might tend his peanuts with as much diligence and skill as a farmer in Australia tended his sheep, but the return would be very different. The just price, to use the medieval term, would have rewarded equal competence with equal earnings. But the market price gave the Nigerian for his peanuts a 700-lbs-of-grain-per-acre level of living, and the Australian for his wool a 1600-lbs-per-acre level of living, not

because of [illegible] nor [illegible] productivities [illegible] but because there were the respective amounts of land that their [illegible] could produce on the family farm.

But isn't there a difference between the wage rate and the wage bill? Does the wage rate determine the price, as Lewis seems to claim? If the differences in wage rates are more pronounced than those in labour productivities, as Lewis assumes, one has to find the roots of the latter. Should their roots be attributed to the lack of industrialisation in the Third World and the vigourous process of industrialisation elsewhere, does not one commit the fallacy of circular reasoning and, worse, incorrect interpretation of the data of world history?

Contemporary Issues

Lewis takes his story right up to date, through the depressions of 1873, 1892, 1929, and 1974, and the accompanying vicissitudes of international economic relations. The exposition is characteristically lucid, sweeping and provocative. He sums up his views on the current situation with the following sentence: "It is in the interest of the poor countries that the rich grow as fast as possible" (p 68).

"The LDCs have within themselves all that is required for growth", says Lewis. "They have surpluses of fuel [illegible] surpluses, if they cultivate it properly. They are capable of learning the skills of manufacturing, and of saving the capital required for modernisation". This was no less true in the early nineteenth century. It would have been far more interesting if the author could shed light on why nonetheless history took the course that it did.

In this view the most important item on the agenda of development today is to transform the food sector, create agriculture surpluses to feed the urban population, and thereby create the domestic basis for industry and modern services. If we can make this domestic change we shall automatically have a new international economic order. He is correct in drawing our attention to the supreme importance of the agrarian question in the Third World. The real basis of the new international economic order will be laid out in the coming battles on the paddy fields, not so much in the diplomatic debates in New York, Geneva, Rome or Nairobi.

Revival of the Asiatic Mode?

S S Sivakumar

Accumulation and Interchange of Labour: An Enquiry into the Non-Market Economy in a South Indian Village by Hisashi Nakamura, Institute of Developing Economies, Occasional Paper Series No 14, Tokyo 1976; pp 138, Price not mentioned.

NAKAMURA's work raises many interesting questions, but at the end one is left with a feeling that much is wanting. It is a Marxian attempt at a village study — in fact, it preceded the more popular work of Djurfeldt and Lindberg[1] — and witnessed the problems inherent in a Marxian village study much earlier.[2] The focus of the book is not on the basis of class structure as in other studies,[3] but on the "radical reconsideration of labour force and its accumulation in historical perspective", based on the *a priori* assertion that the allocation of labour force by the dominant castes is "efficient".

Theoretical arguments of Nakamura are summarised in Chapter 13 of the book entitled 'Extension of the Labour Ability'. First he distinguishes between labour "in the broad sense" (also called "non-labour") and labour in the narrow sense. The first amounts to a "spontaneous development of human ability through voluntary effort" and the second is "promoted and coerced by an external purpose alien to the person working". Following this is the definition of "the more fundamental" accumulation "of past objectified and dead labour" as "the improvement of conditions of productions".

Three such improvements are differentiated: (a) "extension of the hand", ie, tools, implements and machinery; (b) "extension of the land" ie, "expenditure of past labour to convert marsh into paddy field, removal of stones and stumps, levelling, construction of bunds for the field, facilities for irrigation and drainage", all of [illegible] result in [illegible] as a natural force with objective nature, and it appears as if fertility in land increased by itself, and (c) "extension of labour ability", which is "the alteration of the internal nature of the labouring subject", and which is "embodied not in the human body, but between men who work together (namely social production relations)".

These three forms of accumulation are not mutually exclusive, but actually tend to promote one another, thus making possible a number of permutations among the three. Nakamura confines himself to the third form of accumulation as he witnessed it in Abinnimangalam village of Trichy district which he studied during 1967. The essence of extension of labour ability is that it is an endosomatic process, involving mainly apprenticeship and attainment of perfection with crude implements over generations. Surprisingly enough, Nakamura feels compelled to illustrate this with the (by now) famous excerpt from Marx on the Dacca muslin weaver, and not with something out of Abinnimangalam. (However, more of this later.) Technological Progress is defined as a combination of such endosomatic processes with exosomatic processes which enhance the extension of the hand and of land. The degree of co-operation among participants in the social process of production is a key determinant of the contribution of labour ability, towards extension of labour ability, towards accumulation. In exploitative societies, such as "slave farms, plantation enterprises, capitalist factories and so on", labour is alienated and hence its ability is extended poorly. On the other hand, in societies characterised by less developed private property, reciprocal interchange of labour and its products occur on the basis of community cohesion.

These, according to Nakamura, are lessons to be learnt from Abinnimangalam. He identifies Abinnimangalam as a non-market economy, with an organically based village community and built in regulators of social division of labour; in short the Asiatic Mode of Production.

Asiatic Mode in Abinnimangalam

According to Marx, Asiatic Society consisted of the following features: (a) Production was based on a natural economy, oriented to subsistence cultivation. (b) The village community consisted of a blending of agriculture and handicrafts. (c) The village was "self-sufficient" *in most of its economic and* social requirements. It was also insulated to a considerable degree from the

State (d) The State, manifesting itself in the form of despotism, existed on the basis of a threefold appropriation of surplus: "plunder of the exterior", "plunder of the interior" and public works.

Nakamura is concerned only with the local, or the village aspect of the Asiatic Society. His village Abinnimangalam is shown to consist of the following salient features: (i) Private property did not exist prior to the British annexation of India. (ii) Village community was (and is) a relatively close-knit body, controlled by the upper caste dominated panchayat. (iii) The State was removed from the village community. (iv) Production was by and large not related to division of labour through any form of commodity exchange, but only through custom. (v) Social division of labour manifested itself through the caste organisations.

Thus, (barring the integration of handicrafts and agriculture locally), Nakamura's Abinnimangalam is portrayed as Asiatic Society at a micro-level. Even Nakamura's detailed emphasis on the positive role of caste within this community is not derived from Marx's awareness of caste. But Nakamura's contribution lies in expounding the thesis that within the village community the panchayat "will guarantee a high standard of local self-government with mutual co-operation and simultaneously maintain higher caste domination by enforcing obedience of low caste to the *hierarchical* frame work" (p 95, emphasis added).

What are the larger implications of such a viewpoint? First, Nakamura argues that economic policies must give precedence to decentralised, panchayat-based development and administration of society. In other words, the village community should become the nucleus and basis of social development. It is only then that labour based on the traditional system of reciprocal exchange will participate in production in a non-alienated and wholesome manner. Secondly (and this is more significant), economic development itself is a secondary issue: "... every effort has to be made to learn from the advantageous aspects of the village communities in South Asia, ie, a horizontal co-operation by villages rather than intrusion of economic development and modernisation" (p 112).

The first of our questions is why Nakamura should insist on calling Abinnimangalam a "Non-Market Economy'. His own data show this to be incorrect. From 1936-45 to [illegible], there were 48 instances of land purchase involving over 97 acres of land. The residents [illegible] 1966 alone [illegible] of livestock worth over Rs 29,000 and had sold 680 heads of livestock worth over Rs 32,300. Total sale of dry farming crops alone, was worth Rs [illegible] and from cash crop farming on wet lands the upper castes made Rs 3,000 to Rs 4,000 per acre (p 61, Table 14; p 59, Table 13; p 49, 35).

Further, labour exchange through customs of reciprocity is pointed out to be the dominant feature of the local economy. What is interesting (and contrary to Nakamura's assertion) is that there are 141 farm workers classified by Nakamura himself as the class of farm labourers (pp 38-40). Further, all categories of cultivators use hired labour extensively in all operations of cultivation (chapter 7-8). Barring sowing seeds in the nursery, in none of the other operations is the *Kaimat* (or reciprocal labour exchange) or family labour significant. The caste-wise specialisation — eg, *Man-Oddar* or Paraiyar for repair of irrigation channels — also makes one feel that perhaps Nakamura is romanticising the reciprocal labour exchange system.

The author's homework on history also appears patchy and inadequate. For instance, one of the central hypothesis is that private property in land did not exist before the British period. This is entirely incorrect and contrary to known facts.[4]

It is also odd that Nakamura's claim of the stability of village community led by dominant castes goes contrary to his own observation regarding episodes of oppression and growing contradiction between the Adi-Dravidas and Vellalas. It is also strange that episodes such as those of Kilavenmani in 1968 are described as "a menace to their (Adi Dravidas) progress and welfare in the society" (p 95).

This last point brings us to the final comment — that there is hardly anything analytically Marxian in the present work, barring a few cliches, a few quotes from Marx and some emotive expressions such as "private army of landlords". In the absence of a class analysis, proper historical background, it turns out to be methodologically a hotch-potch. His glorification of village communities, is also nothing Marxian.[5]

Nakamura's reconciliation of a repressive hierarchy with equalitarian principles, when he eulogises dominant caste authority as being "essential to the economic structure of the village community", is perplexing. Perhaps it can only be explained by the ethnocentricity of a Japanese mind which adapts itself to Marxist emotions. [illegible] a simple observer [illegible] Nakamura the Marxist. Perceptions of a sensitive observer are difficult to frame within a straightjacket, especially when the perceived reality is as diverse and complex as that of rural South India. In a sense, at this stage when Marxists are just beginning to experiment with village studies, such a dichotomy is unavoidable. Nakamura's difficulties are therefore not those of just a person, but those of a creed rediscovering itself.

Population Pressure and Labour Absorbability in Agriculture and Related Activities

Analysis and Suggestions Based on Field Studies Conducted in Punjab

H K Manmohan Singh

A number of micro studies conducted by the Economics Department of the Punjabi University in that belt of northern India which is associated with the green revolution confirm the view that while conventional strategies of development which resist institutional changes are sure to bypass large groups of people who have neither land nor other capital assets, efforts to check the pressure of population exogenously can be equally counterproductive.

An attempt is made in this paper to present the main results of these investigations and to advance certain propositions by way of a development strategy in the face of the growing labour force explosion.

I

THERE has been an irreconcilable controversy over the reality and myth of surplus population. The debate is likely to continue endlessly because of its ideological overtones. At the same time the policy for reducing unemployment and poverty must derive its *raison d'etre* from the view the inhabitants of a country form of the interaction between man his environment and from the way they organise themselves to provide the material means of sustaining life.

A number of micro studies conducted by the Economics Department of the Punjabi University in that belt of northern India which is associated with the green revolution confirm the view that while conventional strategies of development which resist institutional changes are sure to bypass large groups of people who have neither land nor other capital assets, efforts to check the pressure of population exogenously can be equally counterproductive. An attempt is made in the following paragraphs to present the main results of these investigations and advance certain propositions by way of a development strategy in the face of the growing labour force explosion

II

Table 1 contains data for 6 villages of the Ludhiana district in Punjab. Assuming Rs 1500 as the annual per capita income of rural Punjab in March 1977 (a conservative estimate), 80.5 per cent households were found to be earning less than this average, of whom 66 per cent were earning less than Rs 750. An analysis of the data shows that 33.3 per cent households were below the poverty line according to the norm developed by V M Dandekar and N Rath.[1]

The data on unemployment and underemployment are not easy to interpret. In a predominantly agricultural economy, open unemployment is often negligible and underemployment is difficult to estimate. The large mass of unpaid family workers do not enter the labour market, and their work participation rates vary widely from season to season and with cropping intensity. In a sample of 311 households in 4 villages, only 8 persons were found who were seeking work but had no work (Table 2). Of these 8 persons, 7 were between 12 and 16 years, and the remaining 1 person, a matriculate, was of 20 years' age. All belonged to households which had neither land nor other productive means. Of the total number of households, 36 per cent belonged to this category.

It can be seen from Table 3 that while the percentage of self-employed workers on farm who worked less than 210 man-days in a year is 7.94, that of wage-paid workers is 25.1. At the other end, 83.48 per cent of self-employed workers on farm worked full-time (271 days or more), while only 59.8 per cent wage-paid workers were in this category.

A careful scrutiny of the data confirms an observation made by BN Ganguli that "diversification of occupations, however lowly some of them may seem according to modern standards, together with the widespread prevalence of mixed occupational status, is a characteristic pattern in a low-level economy experiencing high population pressure".[2]

The data on migration flows collected from villages both in the heart and on the periphery of the green revolution areas provide valuable information on the process of labour mobility. As is to be expected under conditions of rapid economic development, there is considerable in-migration as well as out-migration. However, in-migration is about twice as large as out-migration. An assessment of the data shows that while the poor migrate in and out in search of work, those in the middle and upper groups out-migrate to take advantage of better opportunities in such occupations as the army, public services, transport and communications, industry, education, medical services, and the like. Most of the in-migrants in the latter category are those who wish to resume farming in view of the phenomenal rise in the price of land and increased profitability of agriculture or are educated unemployed. An

Figures in brackets are percentages.

important segment of out-migrants is the artisan class that cannot find remunerative work because of disintegration of the household industry or lack of demand for their traditional skills. A case study of two villages in the Patiala district with different degrees of economic development shows that most of the artisans are joining the class of agricultural labourers as a result of mechanisation and introduction of new farm machinery in agriculture. A significant result obtained from the study of income distribution at the inter-caste level in the more developed of the two villages is that while 6.83 per cent households among the richest 20 per cent are from low-caste groups, not a single artisan household finds a place in this category. Taken with other data, it is quite obvious that the benefits of development have gone the least to this class, and it stands almost on the verge of extinction.

An examination of data on fertility (Table 4) collected through specially trained female investigators discloses that the main targets of coercive family planning during the Emergency were those who were either below or marginally above the poverty line. Of 79 operations performed among the sampled eligible women, 56 belonged to households which fall in this category. Since labour is the only resource that the poor can draw upon, destitution drives the poor towards larger families. From among those who reported an active propensity to have more children, there was preponderance of cases among those whose per capita income was below Rs 750. This confirms the belief that the poor are interested in maximising the output of the family and not in its main output per unit of labour. Hence th paradox of shortage of labour in labour surplus economy.

An analysis of the data on the for of family organisation shows its impo tant links with economic factors (Tab 5). It has been found that while there a strong tendency among the landle towards the nuclear family, the ex tended family system is the dominan form among those who own lan There can be three main explanatio for this. First, the extended famil system facilitates diffusion of lan ownership consequent upon enforce ment of land ceiling laws, but pre vents fragmentation of operation holdings. Secondly, it enables the join families to pool their resources to tak advantage of modern technology Thirdly, it enables such families to spare the more educated and resourceful among them for outside employment. Thus those who are better off have also a form of family organisation which is more functional and reinforces their position in society.

The data on technology reveal interesting contrasts. It can be seen in Table 6 that the larger the size of operational holding, the more sophisticated is the technology used. Holdings above 25 acres are all operated with T_3 level of technology, implying large-scale displacement of labour by capital. It can also be seen that the smaller the size of operational holding, the larger is the manpower used irrespective of the level of technology. Since technology carries uniform mechanical performance capacity at all levels, the larger input of man-days on smaller farms suggests that there is better use of equipment on smaller farms and that there exists considerable unutilised productive capacity with large farmers. The use of family labour as also the level of employment tend to increase as the level of technology improves, but reach their maximum at T_2 and not at T_3 level. The sharp decline in total man-days used between T_2 and T_3 levels suggests that mechanisation of agriculture, in particular the use of tractor, is impinging heavily on employment opportunities for human labour.

Table 7 brings out the effect of technology on production per cropped acre. The data show that technology is equally efficient on small and large farms and that there are no economies attached to the size of operational holdings. However, with a given size of the holding, production per cropped acre

tends to increase with the level of technology, and is maximum at T_2 level. This introduces a two-dimensional conflict employment is maximised at T_2 level, output is maximised at T_3 level.

The data on investment (Table 8) show that the households operating 10-15 acres is the most dynamic category. More than half of investment on improvement of land (56.56 per cent) is made by this group. This group also makes the highest proportionate investment on purchase of land. The data further suggest that the households operating more than 10 acres account for 73.36 per cent of total investment on purchase of land, which is indicative of increasing concentration of land ownership with upper-middle and large farmers. Of total investment, 40 per cent is on implements. This confirms that farming in the region is getting mechanised by quick degrees. Disaggregation of data shows the tendency of investment to increase with the size of operational holding up to 25 acres. Thereafter it sharply declines, pointing to the possibility of increased consumption expenditures and undisclosed transfer of surpluses outside agriculture.

III

Such is the profile of rural economy in a state that has experienced a vigorous growth in the field of agriculture and is now the richest state in India. Empirical studies show that this characterisation is not an isolated phenomenon but is typical of development in the country as a whole. In a recent study of an agriculturally advanced area in Andhra Pradesh, B Sarveswara Rao has come to the conclusion that, despite the progress made in the technological and production base of agriculture, 'the rural area of the taluk is characterised by considerable poverty and underemployment'.[3] Rao attributes the situation to four factors: (a) highly unequal distribution of land, (b) large and growing labour force who do not cultivate land, (c) low rate of real wages, and (d) inadequate reinvestment of the economic surplus.

In countries where population pressure is very acute and agriculture is the mainstay of a very large number of working people, as is the case in India, there is no meaningful way in which this pressure can be quantified. Similarly, the plans for reducing unemployment and poverty in these countries cannot run in terms of "so many more man-days of work or so much more food intake for a certain percentage of the population".[4] Nevertheless, recent estimates place unemployment (including underemployment) at 18.4 million people of which the equivalent of 15.8 million is in rural areas. The labour force has been rising at the rate of 5 million per annum from 230.5 million in 1971. Taking the existing backlog of unemployment and underemployment, work has to be found for 70 million persons in 10 years. The problem of poverty is more refractory, as a large number of persons are employed in activities which are not very productive.

In view of our findings what ought to be the thrust of labour absorption policies in agriculture?

It appears that the most important single recommendation would be to go slow on mechanisation. It has been stated earlier that up to T_2 level of technology both employment and output rise, but beyond T_2 level the employment falls while the output rises. This appears to be the effect of increased capital intensity. With a suitable labour intensive technology it should be possible to substitute labour for capital and maintain high levels of production. Tagging a high degree of mechanisation to the improved seed-fertiliser technology can make sense in the context of a capital-abundant economy. But in a labour-surplus economy it works against maximum utilisation of its natural resource endowment and ought to be severely curtailed. In this context the need to develop technology appropriate for labour-surplus economies cannot be too strongly emphasised.

There is also a strong case for reorganisation of agriculture in a labour-surplus economy into small and medium-sized farms if optimum results are to be achieved. Although small farms offer maximum scope for labour absorption, followed by the medium-sized farms (7.5 to 15 acres), large farms are ruled out even on grounds of investment and output. Notwithstanding the fact that the output rises with the level of technology used, it is remarkable that the maximum output per cropped acre for any single size group was recorded on the farm size 7.5-10 acres under conditions of medium technology. The case against large farms is reinforced by the finding that they carry considerable unutilised capacity in terms of farm equipment.

In countries with a large population base there cannot be enough land for all landless to be provided. A long line of economists have therefore argued that land redistribution programmes should be utilised to strengthen the position of marginal and small farmers. Although from the point of view of economic viability, understood as a market process, there may be some justification for this, our analysis clearly shows that giving land to the totally landless so as to bring about more

small-sized holdings will yield better results in terms of maximum utilisation of manpower. Such a measure by itself will not produce significant results unless it is accompanied by a programme of providing complementary assets in a manner that small owners are enabled to use improved techniques of production. That is where the role of the state becomes more pronounced.

However, in poor countries there may not be enough resources to augment supplies of inputs to weaker farmers. Bringing them into farming co-operatives seems to be one answer for raising farm-productivity. The Indian experience strongly suggests that these co-operatives ought to be kept separate from those intended to serve the middle and upper farmers.

The pattern of farm economy that is being suggested will have two major consequences. First, it will draw out the productive powers of the farm economy and accelerate the process of overall development. Secondly, it will bring disguised unemployment into the open and facilitate its absorption in the more dynamic sectors of agriculture and related activities.

As the co-operative sector grows, the number of openly unemployed will increase. The two main activities which can take up this surplus are (i) non-crop husbandry sectors, such as dairying poultry, forest and fisheries, and (ii) rural and small-scale industries. It may be stated here that though the limitations of available resources and the compulsions of surplus labour favour agricultural investment and labour-intensive technology, one must guard against doing so at the sacrifice of output, especially of wage-goods, which will limit the employment potential of non-agricultural sectors. The process of economic growth entails more investment and increased output of wage-goods and raw materials from the agricultural sector. But this cannot be achieved without an adequate level of investment in basic and capital goods industries. In order to optimise both employment and the growth rate of the economy, simultaneous investments

have to be made in both agricultural and non-agricultural sectors, with a gradual progression in the level of technology from T_1 level in the farm economy to high capital intensity in capital goods industries where the choice of efficient technologies is limited.

So far we have looked at the problem from the side of demand. The problem is not as tractable on the side of supply. However, it comes out clearly from facts and observations in section II that the pressure of numbers cannot be brought down through exogenous programmes. There are two reasons for this first, with unequal distribution of land and other productive means, the poor have an economic compulsion to multiply; secondly, in societies where the forces of production have been in low-key for a long time, the poor do not feel the pressure of population. However, once the modernisation of society begins, this pressure becomes open and is a matter of concern to the people. It is at this stage that the state can step in as a good neighbour and provide the necessary medical infrastructure and facilities for regulating the size of families. Two important policy prescriptions follow from this. First, family planning programmes should be introduced only after a region has gone through a period of development. Secondly, these programmes ought to be voluntary and not compulsory.

These are some of the more significant propositions that emerge if one takes a long view of the process of labour absorption. Whether enough social and political energy would be available for their implementation is a different question.

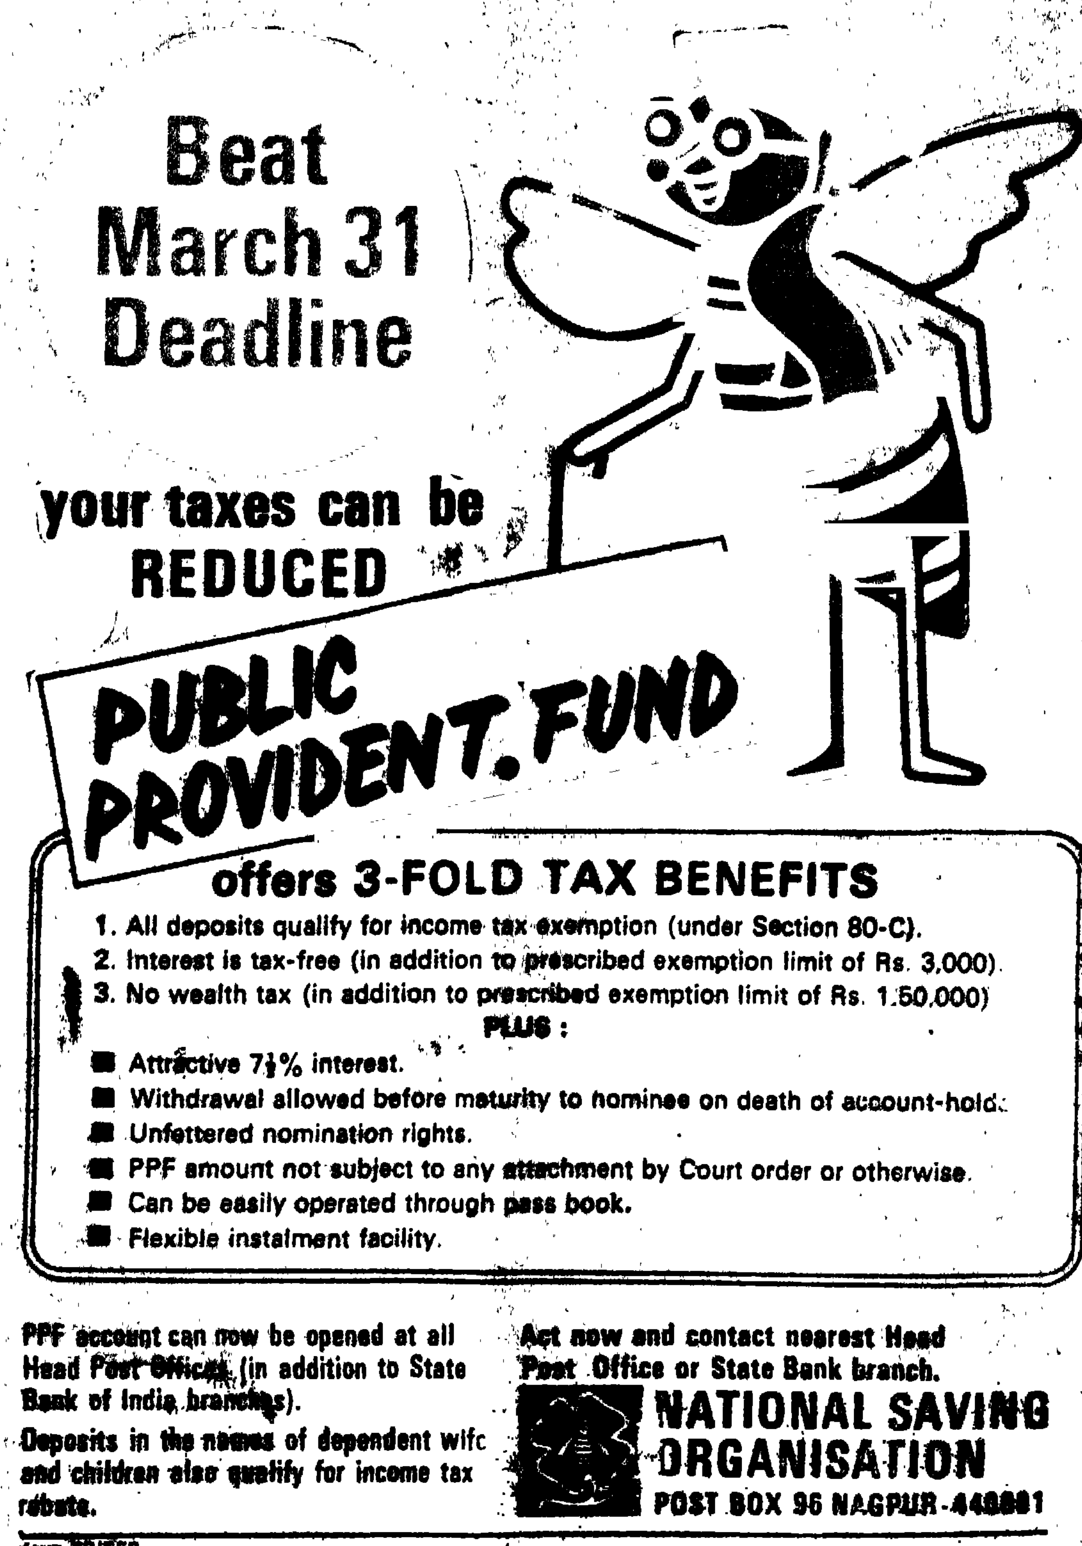
Tribal Peasants in Transition

Chittagong Hill Tracts

B K Jahangir



This article attempts to link the land use in the Chittagong Hill Tracts to changing political decisions from the British colonial period to that of independent Bangladesh. It traces the way in which the concrete and qualitative reciprocities that characterised the relationships of primitive peasant societies in the Hill Tracts have been replaced by the abstract and quantitative exchange relations of the market. This process of the disintegration of th e pre-colonial culture and economy of the Hill Tracts and its integration into the larger market of the S tate has brought along with it certain problems, including the highlighting of the internal divisions within the Hill Tracts society; these are briefly touched upon towards the end of the article.

GEOGRAPHICALLY, the Chittagong Hill Tracts can be divided into two broad ecological zones: (1) hill valleys, and (2) agricultural plains situated in the humid terrain. Within these distinct geographical zones both swidden cultivation as well as wet-rice cultivation evolved. These ecological environments simultaneously conditioned and were conditioned by the social formations that emerged in relation to them. The pre-colonial socio-economic system of the Hill Tracts was created by the specific historical experience of the people The system was gradually enlarged by additional concepts derived from Buddhism, Hinduism, the corpus of pre-religious customs and British and Pakistani Laws. Thus, a certain ideologico-legal system emerged as the superstructure of the Hill Tracts society Buddhism, Hinduism, Christianity and Animism as religious doctrines, and the British and Pakistani laws as legal systems constituted, *a posteriori*, the frame of reference of the ideologico-legal apparatus which rationalised the legitimacy of the power relationships institutionalised by the predominant classes. But the social norms and rules that emerged to channel the political and economic activities of pre-colonial Hill Tracts were geared to production for use, rather than for commodity exchange. This was evident in the rural communities, while in the few administrative centres, artisans and merchants were involved to a certain extent in the production of commodities for exchange.

The socio-economic and political organisation of pre-colonial and colonial hill tracts was articulated by segmentary structures. This organisation was founded upon a multiplicity of rural, tribal or lineage systems. At the central level, the power structure was hierarchical. At the village level, the exercise of political power depended on the consensual allegiance expressed by the inter-connected segmentary units.

The basic unit of this socio-political system was the tribe. This unit was sub-divided into several agnatic lineages, composed of inter-related nuclear or extended corporate families. The size of a tribe varied from a small cluster of hamlets dotting one or two hill slopes to a unit occupying a vast region. The corporate family was the group within which basic social interaction took place: sexual intercourse, child-rearing, socialisation, economic production and consumption. This corporate family consisted of households that were either organised into separate hearths or which lived together around a single hearth. The patterns of residence of corporate groupings varied. They either cohabited in a large house created around a courtyard and containing several rooms or they lived in separated dwellings.

These family units were integrated into multi-cross-cutting patrilineal descent groups that defined the social organisation of each village. The various lineages that made up the village community were incorporated into a tribe that governed the various segments. Although all segmentary societies contain inherent sources of friction that generates internal conflicts, their multiple cross-cutting kinship networks, through an ideology of descent, act as a unifying force when the society is

faced [illegible] social life. That was dismantled several times during pre-colonial and colonial times. The British faced resistance and their encroachment upon the segmentary groups transformed them into cohesive, ramifying, voluntaristic and yet resistant structures.[1] In the face of a common enemy or hazards, the segmentary units act centripetally. Conversely when pressures cease, the societal levels and social segments are distributed as regional nuclei and these are reintegrated into the more or less centralised system.

Land is the basic factor of production. Economic production consists of four predominant subsistence activities: agriculture; animal husbandry; fruit free cultivation; and horticulture. Ecological conditions foster a broad regional specialisation of production.

The socio-economic life of the village is regulated by the producers, self-interests, as expressed in the belief systems, values and norms of behaviour that are more or less shared by certain predominant segments. These segments, superstructures of the rural communities, are of course moulded by historical experience and its underlying material base.

The hill tracts rural population is not, however, made up of socially homogenous small producers who own their means of production. It is, at present, devided into three classes: big landowners, peasant producers and impoverished and landless cultivators.

Process of Differentiation

The hill tracts people are in a transition from a swidden peasant economy to a wet-rice peasant economy. This transition has its impact on the balance of political power in the region.[2] A century ago, the distinguishing criterion could be stated simply: hillmen were exclusively swidden cultivators, locally known as *jhumiyas*.[3] At present plough agriculture is the dominant mode. Plough is used chiefly in wet-rice cultivation. Mustard, chilly, pepper, tobacco and winter vegetable are also produced in ploughed lands. Influx of plainsmen have also increased along with the increase of plough cultivation. The plainsmen control and dominate every walk of life; they are the traders, shopkeepers, unskilled and skilled labourers, boatmen, teachers, officials. They also cultivate the land of the affluent hillmen as share-croppers (as they used to do in earlier times) but in certain cases hold land themselves.

The dominant mode of production does not rule out the swidden mode of production. Among the transitional tribes only in the case of Riang, swidden is the dominant mode. There are some differences in the mode of swidden in the valley and mountain communities, though the techniques used by the two communities are nearly identical. Among the Mizo groups (Lushai, Panku, Benjugi) the decision-making process for cultivation of the village swidden land has a communal character, although the jhums are individual.[4]

Similar communal decision-making process is non-existent among the Chakma at present. Single-family unit is the decision-maker and jhum is done by family-labour. Jhum plots are usually smaller and more widely dispersed. Swidden cultivation is consequently less productive than it is among the Mizo and M'ro. Among the Mogh and Tipra the communal organisations are in decay and swidden operations are individualised.[5]

The most important factor in the evolution of the district's present ethnic geography was the elimination of tribal warfare. Before the last quarter of the nineteenth century Mizo and Khumia tribes living to the east and south of the Hill Tracts made raids for the purposes of taking heads, slaves and booty. These terrorising raids had repercussions on the expansion of the valley people. Lewin[6] in the nineteenth century observed that some of the valley lands were depopulated and deserted. These lands were maintained in the form of extensive reserve forests. The frequent raids by the Mizos and the political disturbances within the Burmese state during the seventeenth and the eighteenth century were an effective deterrent to the overall growth of the valley people. From the early nineteenth century onwards, the increased interaction between the valley people and the plainsmen had its impact on the course of events. Despite their common practice of swidden cultivation, the valley people and the mountain people have little interaction. Despite the problems they face in common with the mountain people, Chakma and Mogh consistently dislike the latter. These are all pointers to a lingering apprehensiveness about them.

By the early 1800s, swidden cultivation was almost non-existent in the hills of the regulation district of Chittagong.[7] This was obviously a result of rapidly expanding Bengali wet-rice cultivation on the adjoining flat land. This extended into Rangunia belt. In this belt the Chakma elite held wet-rice lands worked by Bengali share-croppers before 1860. The boundary between the regulation district and the Hills Tracts, drawn in 1860, was based on a demarcation of the eastward limit of wet-rice cultivation. In 1870 the practice of swidden was officially prohibited in Chittagong district. The swidden cultivators by that date were pushed into the Hill Tracts. The foregoing exposition points that there has been a sustained socio-cultural contact between plainsmen and valley hillmen.

State Policies

Here we make an attempt to link the land use in the Hill Tracts with political decisions from British colonial period to independant Bangladesh. Three successive types of land-use pattern and political decisions may be identified. In the first type, in the earlier British colonial period, the land use pattern was swidden. But this pattern was linked to the prevailing insecurity, associated with a power vacuum which inhibited the spread of permanent plough cultivation. In the second type, from the British colonial period to Pakistani colonial period when swidden and plough cultivation both flourished, the State authority was primarily concerned with policing and though outwardly impartial towards the two production modes, tended to discourage swidden. Sopher states: "While both swidden and plough cultivation have been excluded from the Reserve Forests, which cover about a fourth of the area of the Hill Tracts, the effect of this has been much more damaging to swidden because of the increasing pressure it has put on the available swidden land. The resources of the Reserve Forest have been exploited for the benefit of the state that has provided the police machinery'.[8] In the third type of relationship between political power and resources use, as pronounced after the establishment of Bangladesh, the tilt is definitely towards permanent agriculture disfavouring swidden.

Emergence of Market Economy

The rural people of the Hill Tracts are now involved in a market economy. This involvement has made plough cultivation the dominant mode with increasing dependence on the bazaar and the need to specialise in intensive agriculture in order to find a satisfactory place within an exchange economy.

This involvement with the State's legal, and fiscal apparatus and market economy has produced various dimensions: (a) the swidden cultivators

[illegible]-wet-rice peasants are placed subordinately within an exchange economy; (b) this awareness of 'inferiority' has increased the reluctance of remaining swidden cultivators to change their mode of life; (c) this has produced growing differentiation and estrangement between two classes within the same ethnic group, (d) though permanent agriculture and swidden cultivation exist simultaneously within the same ethnic group, swidden in such cases does not form a separate mode but becomes a marginal economic activity within a complex peasant society, undertaken on an individual basis and heavily circumscribed by state regulation; (e) in such a situation the swidden cultivator becomes a short-term tenant with little or no safeguards of his tenure; (f) only the mountain-folk practise swidden as separate mode; (g) the curtailment of swidden in the valley increase, alternative resource uses; (h) such alternative uses are managed either by private entrepreneurs or by the State; and (i) the main emphasis these days is on the cropping of bamboo, the logging of commercial species of timber, the establishment of tree plantations such as teak, the regrowth of mixed forest in the general interest of watershed management. The shrinking of swidden mode points to the relative ineffectiveness of swidden peasants in the political sphere and the increase of market economy points to the subordinate position occupied by the wet-rice peasants of the Hill Tracts in the national economy.

Change in the Ideological Sphere

The process of change generated in the politico-economic sphere has its impact on the ideological sphere.

Tribal leaders, at present, are rich landlords. Kin loyalty is weakened — for instance, the loosening of co-operative ties within the Chakma gozas. These were originally endogamous, territorially defined clans. Ties of this kind are supplanted by other kind of relations that transcend kin groupings and are enforced by institutional means (by Chief's agent, government officials, etc) other than the social pressure of the kin group. On the other hand, the search for identity has produced differentiation and estrangement between the tribes. For instance, the educated Tipras try to demarcate their cultural traits from the Chakmas and identify themselves with the greater Hindu culture which emanated from the Tripura state of India, since they believe their ancestors originated from that area. Again in certain Mro villages Buddhist shrines and limpo (sacrificial posts) exist side by side. M'ro headmen, though Buddhists, are reluctant to talk about the function of the Limpo. The Lushai and Panku who adopted Christianity as a result of Baptist Missionary activities have radically changed in many aspects of culture. They, unlike their pagan kins, do not keep gayal for sacrifice at feasts nor prepare and consume Zu or rice beer. Among them the institution of bachelor houses where sexual experimentation by adolescents were encouraged is forbidden. This symptom of current ideological expressions is also pronounced in other areas. The language of the Chakma and Tanchangya is an archaic dialect varient of Chittagonian Bengali. They are nominally Buddhists, adhere to the Theraveda form of Buddhism practised in Arakan and other parts of Burma and have Hindu and Buddhist personal names. The Tipras speak a Tibeto-Burman language, exhibit some traits of Bengali Hindu religion, claim caste Hindu status, and have personal names of Bengali Hindu origin. The Mogh hillmen use Burmese dialect like the plainsmen of Arakan and are close to the Mizos who are not socially different from the Mogh. The Riang and Murung in their religious and social life imitate the pattern set by the Tipras. The elites of the larger groups, particularly the chiefs, clan heads, the affluent, model their life-style on the Hindu or Buddhist or Muslim gentry of the plains. On the other hand, some educated youth talk the language of Maoism. Generally speaking, while the elites and the affluent practise the dominant ideology of the plains, some of the younger ones are searching for an alternative ideology.

Previously, the social, economic, religious, political and ideological functions were closely interrelated and often inseparable in society as well as in the mind of the individual. The concrete and qualitative reciprocities that characterised the relationships of primitive peasant societies in the Hill Tracts are replaced by the abstract and quantitative exchange relations of the market. In place of the real life-process characterised by reciprocity and equivalance, unilateral constraint and exploitation are emerging.

Conclusion

Thus the constraint and the exploitation are caused by two interconnected factors, one extrinsic, the other intrinsic. The extrinsic factor is the policy of successive governments from colonial to the post-colonial period. The intrinsic factor is the natural process of demographic growth within a hard pressed population, which further accelerated the deterioration of its social condition. Once the existing property relations were forcibly dissolved and restructured in favour of the settlers from outside and the affluent of the Hill Tracts, the dispossessed producers had no other feasible economic alternative, but to enter into the newly super-imposed relations in order to eke out their livelihood. This process disintegrated the pre-colonial culture and integrated the Hill Tracts economy into the larger market within the State. This process has also brought internal divisions within the Hill Tracts society: an affluent articulated class possessing the means of production, and a resourceless, disinherited, non-articulate class. Also, a lumpen-proletariat has been catapulted into existence. These features hamper the development of class consciousness and are conducive to the emergence of proto-nationalist and populist tendencies.

AMONG the annual reports issued by different departments of the government of India, the most mechanically compiled is perhaps that of the Department of Company Affairs on what it calls "the working and administration of the Companies Act, 1956". The latest report, just released, relates to the year ended March 31, 1978. Two conspicuous aspects of the report which make it a largely wasted effort are the bland references to sections, sub-sections, and provisos of the Companies Act and the equally dead-pan enumeration of the number of cases or applications received, disposed of and pending under one section or the other of the Act. In most cases, these references to sections or to the number of cases convey no idea to the general reader of the nature of the cases reported or the quality of the decisions taken. On the whole, the report reflects the lackadaisical manner in which the whole system of checks and balances embodied in the instrument of the Companies Act, 1956, is operated. It does not come as a surprise, therefore, that during the five years from 1973-74 to 1977-78, the average fine imposed per case of prosecution ending in conviction ranged from Rs 181 in 1973-74 to Rs 485 in 1976-77 and in 1977-78 was Rs 262. The deterrent effect of such penalties can be imagined.

The only part of the report which is useful is the one which presents a "statistical position of companies and capital issues". This section contains useful data on registration of government and non-government companies, companies at work, capital issues, public response to capital issues, underwriting, and cost of raising capital.

Three notable features of the data on company registrations are: sharp rise in registration of non-government companies in the past few years, the tendency on the part of state governments to float a large number of companies, and a disproportionate growth of companies in the services sector.

The number of non-government company registrations, which was 1,487 in 1969-70, rose to a peak of 3,712 in 1973-74. Though the number of registrations thereafter was lower at 3,599, 2,913, 2,595 and 2,624 in the subsequent four years, the overall level of registrations has remained far above the annual average of about 1,000 during the 1960s. Considering that during this period there has not been any noteworthy expansion of private sector investment, industrial output or non-agricultural employment, the proliferation of companies in the private sector does raise doubts about the nature of activities of these companies.

Between 1970 and 1974, the government had, in the name of streamlining the system of industrial licensing, vastly liberalised the issue of licences. As a result, there was a spate of applications for industrial licences, the number rising from 1,420 in 1969 to 6,032 in 1974, reflecting primarily an attempt to pre-empt industrial capacity. The proliferation of company registrations was no doubt largely intended to take advantage of the liberal issue of latters of intent and licences. The number of public limited companies registered in the private sector increased from 188 (with an authorised capital of Rs 164.4 crores) in 1976-77 to 206 (with a capital of Rs 114.9 crores) in 1977-78. The number of private limited companies registered has been much larger, ranging from 3,346 in 1973-74 (with an authorised capital of Rs 238.7 crores) to 2,407 in 1976-77 (with a capital of Rs 129.5 crores); in 1977-78 it was 2,418 (with a capital of Rs 147.5 crores).

Taking a longer span of years, the number of non-government companies at work rose from 26,007 in March 1961 with a paid-up capital of Rs 12,715 crores to 28,666 in March 1970 with paid-up capital of Rs 1,964.1 crores, showing a rise of about 2,600 in the number of companies. By March 1978, however, the number of non-government companies at work had shot up to 48,434 with a paid-up capital of Rs 2,892 crores, a rise of nearly 20,000 in the number of companies in a period of eight years. The number of public limited companies had declined from 6,650 in 1961 to 6,091 in March 1970, but thereafter rose to 7,886 by March 1978. The number of private limited companies shot up from 22,575 in March 1970 to 40,548 in March 1978.

Equally striking has been the rise in the number of non-government companies belonging to the services sector, i e, construction and utilities, commerce (trade and finance), transport, communication and storage, community, and business services, and personal and other services. In 1977-78, the entire increase in the number of newly registered non-government companies was accounted for by these categories. About a decade ago in 1968-69, such new registrations in the services sector had totally 320, which rose to a peak of 1,458 in 1974-75. At the end of March 1978, out of a total

[illegible] 40,434 non-government companies at work, as many as 22,406 belonged to the services sector.

A third interesting disclosure is the tendency of state governments to set up public corporations for every conceivable type of activity, particularly activities of a 'service' nature. The number of government companies increased from 142 in March 1961 to 282 in March 1970, but by March 1978 it had shot up to 745. Uttar Pradesh which had 11 companies in March 1970 and 41 in March 1974, now has as many as 85 companies. The number of state government companies in the other states also showed sharp increases. From the bare information on the number of state government companies, it is difficult to pass judgment on their usefulness. There is a general impression, however, that a large number of public corporations have been set up by state governments to seek financial assistance from the public financial institutions and to substitute such assistance for budgetary finance.

Data on project costs compiled from the prospectuses of companies issuing capital during the year have been presented in the report for three types of companies: new public limited companies, private limited companies converted into public limited companies, and existing public limited companies. The aggregate project costs of the 80 companies issuing capital in 1977-78 was estimated at Rs 329.86 crores as against Rs 155.74 crores for 69 companies issuing capital during the previous year. For assessing investment trends in the private corporate sector, these data on project costs are somewhat suspect if only because in recent years a substantially higher proportion of project costs consists of requirements of working capital. Working capital as a proportion of total project costs earlier used to be around 10 to 12 per cent. However, in 1976-77 the proportion of working capital to total project costs shot up to 17.8 per cent and in 1977-78 to 26.9 per cent. In 1976-77, Rs 27.67 crores out of total project costs of Rs 155.74 crores and in 1977-78 as much as Rs 88.71 crores out of a total of Rs 329.86 crores were for working capital purposes. This is probably the result of an attempt to secure a larger part of working capital from term-financing institutions instead of commercial banks because the former charge 11 per cent or less as compared with the banks' rate of around 15 per cent prevailing in 1976-77 and 1977-78.

The composition of project cost shows a sharp decline in the share of plant and machinery in total cost. In 1969-70 plant and machinery accounted for as much as 64 per cent, but in 1977-78 its share was just 40 per cent. Even the proportion of cost of lands and buildings has tended to come down from 11 per cent in 1969-70 to 8.78 per cent in 1977-78. In other words, a large and rising proportion of the project costs of companies is getting absorbed by peripheral costs. Besides working capital, discussed above, these cover items like technical knowhow; issue expenses; pre-incorporation, pre-operational and preliminary expenses; and contingencies. Technical knowhow expenditure had absorbed just 0.4 per cent of total cost in 1969-70, but in 1977-78 it appropriated 2.23 per cent; the share of pre-incorporation, pre-operational and preliminary expenses rose from 0.6 per cent in 1969-70 to 7.01 per cent in 1978-79. In 1969-70, out of a total project cost of Rs 120.4 crores, pre-incorporation, etc, expenditure was Rs 0.66 crores. In 1977-78 out of a total project cost of Rs 329.86 crores, as much as Rs 23.14 crores were for such pre-incorporation, etc, expenditure.

To what extent these items of expenditure represent methods of siphoning off funds from the corporate sector by promoters of companies is a matter for detailed enquiry. But two observations can be made with confidence. First, the rise in costs of industrial projects, of which so much has been heard in recent years, is not the result only, or often even mainly, of increases in the cost of plant and machinery. The rising proportion of costs of peripherals has a great deal to do with it. Secondly, the data are based on the initial estimates as contained in the prospectuses of companies issuing capital. This picture of project costs generally undergoes drastic changes as a result of large cost overruns. If the cost patterns revealed in the companies' prospectuses contain items which strongly suggest siphoning away of funds by company promoters, these items should be expected to be even more conspicuous in the final picture of the actual costs of projects.

The changes that have taken place in the manner of financing of project costs are, it must be pointed out, wholly conducive to such draining away of funds. In 1969-70 companies depended on loans from different financial institutions [illegible] extent of 28.4 per [illegible] loans from public fi[illegible] banks, etc, together [illegible] 61.7 per cent of total [illegible]. The proportion of loans from public financial institutions, etc, was 54 per cent in 1973-74, 56.9 per cent in 1975-76, and 61 in 1976-77. Such [illegible] availability of borrowed funds has adversely affected cost-consciousness among promoters of companies. The public financial agencies, despite their neck-deep involvement in project financing, have by and large failed to enforce adequate scrutiny of project expenditure incurred by company managements.

The suggestion of draining out of funds, or at any rate extravagant use of public funds, is also supported by the increasing cost of raising capital incurred by companies issuing capital. For a total amount of Rs 71.71 crores of share capital issued or Rs 57.15 crores offered to the public, the issue expenses came to Rs 4.90 crores, or *6.83 per cent of the amount issued* or 8.58 per cent of the amount offered to public. This, again, is a phenomenon of the 1970s, of the period when the financial institutions emerged as important purveyors of project finance.

Defence

At Home and Abroad

THE Annual Report of the Defence Ministry for 1978-79, apart from providing some carefully guarded details about the increasing size, strength and sophistication of India's war machine and apart from providing such interesting tidbits as that during the year, its directorate of public relations conducted "more than 150 press tours", also provides some interesting details about the conduct of India's armed forces in what one might call domestic and foreign affairs. These are detailed in the two chapters entitled 'co-operation between armed forces and civil authorities' and 'co-operation with foreign countries'.

One constant feature of the 'co-operation' between the armed forces and the civil authorities in India has been the use of the former as virtual strike-breakers in cases of industrial disputes. The use of the army for breaking a strike is not new, and though its most notorious instance was the deployment of troops to break the railway strike in 1974, such use considerably predates the railway strike. Consistent with this

[illegible] were deployed in [illegible] in June 1978 following a [illegible] by the electricity workers and in December 1978 in the whole of Uttar Pradesh during the strike by UP powermen. The Report also enumerates the many instances when the armed forces helped the civil authorities during natural calamities such as floods, cyclones, snow storms, etc; what is however more interesting than these detailed enumerations is that the Report is absolutely silent about the role of the Indian armed forces in what the Annual Reports in earlier years used to describe as 'maintenance of law and order' and 'counter-insurgency operations', particularly in the north-eastern region. It cannot be that such 'co-operation between civil authorities and the armed forces' has stopped, or that the armed forces have ceased to engage in 'counter-insurgency' operations in regions where the Armed Forces (Special Powers) Act, 1958 (or similar legislation) is proclaimed to be in force. But there is not a word about this aspect of the acivities of the armed forces in the latest (or even in last year's) Report of the Defence Ministry.

Ever since a separate chapter enumerating 'co-operation with foreign countries' began to appear in the Annual Reports, not a year seems to have gone by without the visits of a military team from Iran and the United Kingdom. This apparently close link between the military establishments in Iran and India is really curious, for till very recently Iran was part of a military alliance which was widely disapproved of by the ruling circles in India; and yet, every year a delegation each from the Imperial Iranian National Defence University and the Royal College of Defence Studies, UK, has undertaken an extensive tour of defence establishments in this country. No dobut such visits were returned and military teams at fairly senior levels also undertook extensive tours of defence establishments in such friendly countries like Iran; but the Report lists only visits by Indian service chiefs abroad (which could not anyway be normally kept concealed) but has nothing to say of visits by Indian military delegations to foreign countries.

The problem faced by such publications as the Annual Report of the Defence Ministry is one faced by all military establishments. On the one hand, these establishments have to play down the obvious fact that they are all designed for the express purpose of waging war since, by definition, [illegible] country goes to war on its own, but is always forced into it as a 'defensive' measure. Nowadays no government, not even in Britain which till recently had a war office and a secretary of state of war, has a war minister; they all have only defence ministers. At the same time, the directorates of public relations of these vast and growing establishments have to reassure the public by providing them enough factual details about the fine fettle of the war machine they preside over, while clouding these revelations in sufficiently convincing euphemisms. The Annual Report of the Defence Ministry performs this task with middling success.

Industrial Finance

Untapped Experience

A Correspondent writes:

ABOUT the relationship between the level of operations of the country's industrial term-financing institutions and the level of investment activity in the industrial sector of the economy, the only thing that can be said with any certitude is that very little can be said. According to the government's latest Economic Survey, the total assistance sanctioned by the three all-India term-financing institutions — the IDBI, the IFC and the ICICI — shot up from Rs 149 crores in 1970-71 to Rs 882 crores in 1977-78, a rise of nearly 500 per cent in a span of seven years. The rise in industrial investment was, however, considerably more modest. So when the ICICI informs us in its annual report for 1978, released this week, that its net sanctions went up by nearly a-third from Rs 104 crores in 1977 to Rs 138 crores in 1978 and that its disbursements, profits, earnings per share, etc, all showed varying degrees of improvement, we may readily commend it for satisfactory corporate performance. But beyond that it is not clear what wider satisfaction may be derived from these statistics.

In this respect, the ICICI's annual report is singularly unhelpful. Which were the companies to which it sanctioned and disbursed assistance during the year? How many of them were new ones and how many established ones? How many belonged to large business houses or had significant foreign capital and control and how many represented the endeavours of relatively new entrepreneurs? What was the total investment envisaged in the projects which received ICICI assistance? How was this investment distributed among different industries? Where were the projects proposed to be located? What was the break-up of the investment as between plant and machinery and other heads? What was the import component of the investment? What sort of foreign collaboration arrangements, if any, did the projects involve? And so on and so forth. The wider interest in the activities of a term-financing organisation, such as the ICICI, is because of their impact on the pace and pattern of industrial growth. Yet, incredible as it may seem, in a report which runs to over 75 pages, there is no information on any of the above aspects of the ICICI's operations. All we have are two very small tables on the very last page, purpoting to give the industry-wise and state-wise distribution of the ICICI's total assistance till now. The industry-wise classification is unilluminating because the industry categories used are too broad and the information pertains to a single point of time and so gives no idea of changes, if any, in the industry-pattern of the ICICI's assistance.

The state-wise classification lends substance to the criticism that industrialists and industrial projects in western India have received a disproportionate share of the ICICI's favours. Almost one-third of the ICICI's total assistance to-date has gone to Maharashtra alone and Maharashtra and Gujarat together have accounted for nearly 45 per cent. Questioned about this at a press conference on Monday the ICICI's chairman, according to newspaper reports, attributed it to the alleged tendency on the part of financial institutions to concentrate on lending in the vicinity of their headquarters and so suggested, as an answer to the problem, the setting up of separate financial institutions for each region with headquarters in that region. This seems to be altogether too simple a view of the factors responsible for industry getting concentrated in particular parts of the country. All the states now have state financial corporations and many have state industrial development corporations as well. The performance of these corporations, no less than that of the all-India term-financing institutions, should act as a damper on excessive optimism about the capabilities of financial institutions to spark industrial development in hitherto industrially backward states.

This kind of naivety is all the more puzzling, coming from an organisation which, because of the very nature of its activities, should be expected to

have the most intimate contact with the process of industrial development at the grassroots level, all the way from the conception and formulation of industrial projects through the various stages of their implementation to their eventual commercial operation in virtually the entire range of large-scale industries. What is more, it is evident from its annual report that the ICICI has the high-paid manpower resources to subject all this experience to careful analysis and to derive general propositions about the tempo and pattern of capitalist industrial development in the country and the prospects of such development in the future. Unfortunately, if such efforts are in fact undertaken within the ICICI, not much trace of them is discernible in the annual statement of the corporation's chairman. The statement consists essentially of a series of demands addressed to the government, such as that price and distribution controls on industry be further relaxed, that credit restraint not be allowed to hamper production, that the tax structure be 'rationalised', that steps be taken to foster the growth of the capital market, and so on. In this respect the speech is remarkably akin to what we are used to hearing from the spokesmen of private industry.

And that is a great pity, because it is time that those who seriously believe that efficient capitalist development is both possible and capable of providing solutions to the country's economic problems get out of the sterile groove of blaming the government's economic policies for everything and begin to examine objectively the obstacles to this process created by structural or systematic factors such as, for example, the monopolistic and near-monopolistic conditions which have come to prevail in many major industries and which suppress the competitive market mechanism, the stifling of the growth of the entrepreneurial base as a result of the dominant position acquired by a small number of Indian business houses and multinational corporations, and the restriction of the domestic market because of the unchanging or too-slow-changing production relations in the agricultural sector.

To rail against the government, in season and out of season, may indeed succeed in securing certain limited political gains for industrialists without, however, loosening the basic constraints on capitalist industrial growth, which is what an organisation like the ICICI, even in terms of its own values, should be concerned about. To take an example, the ICICI chairman argues how "excessive taxation of some items of consumer goods which are treated as 'luxury'" has limited the demand for these goods and, therefore, adversely affected the growth of the industries producing them. In fact, a glance at the details of industrial production in the last few years will show that some of the most impressive growth performances have been by luxury goods industries, despite the allegedly heavy burden of taxation on them. The problem here is quite a different one: it is that most of these industries have such limited backward and forward linkages that even their very rapid growth can have little impact on overall industrial investment or output or employment.

Western Europe

EMS Under Way

A Correspondent writes:

THE European Monetary System has at last got under way, after a two-and-a-half month delay. Even though the launching of the system coincided with the six-monthly EEC summit, this time in Paris, there were no ceremonies to usher in the EMS. The reason: France had snatched away the initiative from the other eight heads of governments by giving, a week earlier, a green signal to the EMS.

The establishment of the new monetary system, scheduled initially for January 1, had been stalled by the sudden French refusal to join. This was all the more surprising as the French President Giscard D'Estaing and the West German Chancellor Helmut Schmidt had been the two most active initiators and canvassors of the system. Whatever the real reasons, Paris seemed to have recognised almost overnight the need to alter the Community's system of financing farm trade before the EMS could take off.

Financial mechanism of the EEC operates through levies or subsidies — known as Monetary Compensatory Amounts (MCAs) — on farm trade between the member states. The purpose is to avoid price cuts in strong currency countries or corresponding increases in weak currency countries. France insisted on an agreement to eliminate existing MCAs and to limit the creation of new ones, largely because they act as a tax on its own farm exports and keep the incomes of its agricultural producers below the level in West Germany. For German farmers, by contrast, MCAs provide a subsidy enabling them to sell their produce competitively on EEC markets. Bonn's agriculture minister Josef Ertl was prepared to discuss the phasing out of 'green' currencies only if guarantees were given that any resulting loss of income for West German farmer should be compensated by an increase in the Community's farm price level.

While the Bonn-Paris dispute continued, Britain stepped into the row asking for an overall reform of the whole Common Agricultural Policy (CAP). At the same time London made it clear that it did not plan to enter the full EMS immediately. Britain evidently keen to prolong the delay. Observers in Brussels suggested that while the EMS remained in the air, Britain expected to have more leverage for extracting concessions from the other eight on some of its longer term demands. These included the redistribution of the EEC resources in a way more beneficial to Britain.

Even as the agriculture ministers met early March in Brussels, the British agriculture minister John Silkin rejected the compromise formula proposed by the Commission to resolve the Bonn-Paris dispute. The loosely worded compromise set out a framework for getting rid of MCAs. Even though designed as a facesaver for the French, Paris found the formula satisfactory. West Germany also had no objection as it does not seek to curb the growth of MCAs Bonn pays to the farmers at home.

Whereas the settlement of the Franco-German farm price dispute has paved the way for the EMS to come into effect, Britain continues to fight shy of going the whole hog. It participates in the new currency settlement without formally linking the sterling to the other EEC currencies. In fact, for several months now, the sterling, the lira and the franc have been adjusted against the market rates of DM, on the last trading day of 1978, which was expected to be the base day for EMS to take effect. On the other hand, the movements of Dutch guilder, Belgian franc and Danish crown have been determined by the rates within 'the snake' of European currencies. These rates were fixed in the wake of DM revaluation last October.

This close interrelationship between the western European currencies has prompted the President of the Bundesbank (West German federal

banks [illegible] to talk of a de facto EMS being in operation. The only difference is that the central banks of the Nine have not been intervening as the EMS would oblige them to. Currencies, particularly in the EMS, can move 2.25 per cent on either side of the central pivotal rate, fixed in terms of the European Currency Unit which is a floating basket of EEC currencies. The Italian lira can move 6 per cent either side.

The fact that EMS rules require a central bank of a country to intervene, in case its currency diverges more than £7 per cent, could lead to changes in domestic economic and monetary policies of participating countries. Whether this really happens remains to be seen.

LETTERS TO EDITOR

New Exercise in Lawlessness

IT is precisely the institutionalised forces of 'law and order' which take the lead in trampling all elementary decencies under their heels, ironically in the name of 'law and order'.

The government of Andhra Pradesh, with its record of lordly misrule, is giving the people a fresh taste of Emergency zoolum. M Chenna Reddy has unleashed terror in its ugliest form in Adilabad and Karimnagar districts after notifying them as 'disturbed areas'. Now comes the news of Koteswara Rao's apprehension by the police. Koteswara Rao is a leader of the CPI(ML) in Karimnagar district. Till now his whereabouts have not been revealed. It is feared that he has been either liquidated (if so, in a supposed 'encounter') or subjected to third-degree methods of torture in some dark police hell-hole.

Then there is the sorry plight of about 100 villagers of Panditapuram in Khammam district where the police had opened fire sometime back on a peaceful procession, killing two. They are now in Warangal jail. They are all from the poorest sections and they include both men and women. They had earlier been very severely tortured in the panchayat office of the village where they had been kept in illegal custody for about a week.

Lastly, two members of the Revolutionary Writers' Association, P Vara Rao, Editor of *Srijana*, and A Ranga Rao, were arrested on March 6, along with some members of the Radical Students' Union, just on the basis of a flimsy allegation by a CPI(M) MLA, Omkar, that he suspected them in connection with the bomb-outrage against him in Hyderabad. Neither Omkar nor his Congress (I) protectors and the police are sure of their facts. It is a pity that the CPI(M) is bent upon discrediting its political opponents and, in the process, invoking the aid of the government with all its repressive machinery.

This is a splendid opportunity for the police to flex its beastly muscles once again in a new bout of repression. It is a warning of what is impending — a fresh orgy of lawlessness by the government and a return to the fascism of Indira Gandhi and Jalagam Vengal Rao.

Time to Make Choices

THE further letter published in your issue of March 3, 1979 from the anonymous reader is an example of the pistachio of misrepresentation and invective-mongering which, at least in some circles, passes for scholarship. But since you have chosen to print it, it is my social obligation to mention a couple of points. First, since what he says I have said is not what I have said, the conclusions that he contortedly derives from my alleged statements are figments of his prejudiced imagination. Second, the letter-writer complains that the CPI(M) is "never known to have raised" the issue of the link between Centre-States relations and class relations in the manner I have raised; neither the CPI(M) nor the Left Front Government of West Bengal can assume any responsibility for the limits of his knowledge.

Let me also add that in the various representations made by the state government, whether before the National Development Council or the Seventh Finance Commission, there has been absolutely no special pleading ever on behalf of West Bengal; our demands have been raised on behalf of *all of the federating states* of India considered together. The kind of parochialism and sectarianism which your reader — who continues to lack the courage of his identity — would like to foist on it is anathema to the Left Front Government of West Bengal.

China, Vietnam and Kampuchea

BIJOY KUMAR BASU, veteran of the Indian Medical Mission to China (1938-1943) and President of the All-India Dr Dwarkanath S Kotnis Memorial Committee, and Danial Latifi, General Secretary of the Committee, have issued the following statement:

We welcome the withdrawal of Chinese forces from Viet Nam in conformity with the Draft Resolution proposed by the five ASEAN countries, which won the support of no less than 13 members of the UN Security Council, with only the Soviet veto and Czechoslovakia's vote opposing it. We are distressed to find that large contingents of Vietnamese and other forces are still illegally occupying Kampuchea (Cambodia) despite overwhelming world opinion, reflected in the Security Council, as well as overwhelming Indian opinion, voiced also by the Government of India, demanding their withdrawal.

We disapprobate the attempt made by the Soviet representative at the recent Security Council meeting to misuse the joint communique issued by the Indian and Soviet Prime Ministers, at the end of Kosygin's visit to India, and to misconstrue and misrepresent it as condemnation of China. No such condemnation is to be found in the said statement and communique as officially issued from New Delhi on March 15, 1979.

In view of the continuing defiance by Viet Nam and her supporters of overwhelming world opinion (reflected in repeated Security Council sessions) and also of Indian opinion, demanding withdrawal of foreign armies from Kampuchea (Cambodia), we wholeheartedly support the just struggle of the Kampuchean nation and the Government of Democratic Kampuchea and their armed forces heroically fighting for national independence and sovereignty and we call upon all Indians, all Asians and all humanity to support their sacred cause which is of the same nature as that for which Kotnis laid down his life.

Danial Latifi

The External Dialogue

Romesh Thapar

SOBER or otherwise, there is a dreary heaviness about Soviet diplomacy — and this is without aspersions about the end results which are very often pleasant and unexpected. Even Prime Minister Kosygin's sojourn in India, programmed with perfection by the Chinese punitive attack on Viet Nam, was not able to shed the familiar touch. The obsession with getting India to align against China, and to disrupt attempts to normalise relations, was so marked that the last day of discussions on a joint communique took on the colouring of high drama.

The question about declaring China an aggressor and the related matter about the timing of the recognition of the Kampuchean government installed by Viet Nam are valid matters for internal debate (and even with lobbies nurtured by the USSR), but it passes comprehension why Moscow with all its interest in India should not be able to see Delhi's need to detach China from a number of its unthinking adventures along a very extended common border. The Pakistan position is of particular significance, what with the renewed US interest in this area, and the Chinese tendency these days to think in terms of US scenarios.

Indian Position

That the Soviet delegation had to rest content with a simple and straightforward call for the evacuation of Vietnamese territory (without any reference to Kampuchea) was the result of solid argumentation by Prime Minister Desai and Foreign Minister Atal Behari Vajpayee (who, contrary to inspired rumours, was very much a part of the Indian batting!). The Janata government is convinced that only a cautious and intelligent handling of the tensions in the former "Indo-Chinese" region, and the inevitable tangles between Viet Nam and China, can serve the interests of Southern Asia and the non-aligned world. The internal pressure to draw distinctions between regional and continental collision is also rejected for the same reasons.

May be, the Indian position will emerge with greater clarity when policy perspectives are sketched for the subcontinents' involvement with the ASEAN group of nations — Thailand, Malaysia, Singapore, Indonesia and the Philippines. This new development involves Vietnam's participation and will have wide repercussions on the Asian situation. But surely the Soviet Union understands the nature of these alignments and how they balance power in the region. Denunciations of the kind attempted to be projected by Moscow through India would damage this effort.

West-Oriented Too Long

Admittedly, India is moving in an unprepared way to cope with a situation which has seen startling changes. We still have little or no presence in South-East Asia, a decision of several years which we seemed to have enjoyed in a Foreign Office oriented to the West. As for the Islamic world, all we can do is to push a hastily-gathered delegation of Shias headed by Ashoka Mehta. We are drifting, catching at bits of analysis thrown at us by wandering "experts" from the West, when we should be leading thinking on the future of the Islamic lands stretching from our borders to the shores of the Mediterranean.

What else does a lively interest in non-aligned action mean? Yes, there is political uncertainty internally and it is bound to confuse or weaken our external dialogues — one has only to sample the rather obvious lobbying in the Capital to appreciate this — but, whatever the odds, Prime Minister Desai has to follow-up his discussions with Prime Minister Kosygin by initiating intensive discussions with the political leadership of all parties to break the lobbying and to evolve a new consensus around India's external role. It will take a lot of effort to get him moving but the sooner the Janata party activists get to work the better.

May be, some unilateral moves would help. The upgrading of diplomatic missions in Southern Asia, and their reorganisation and expansion for new tasks, would certainly stir the corridors of the Foreign Office and cause healthy vibrations in the region. The abolition of entry visas for Pakistani citizens, an idea mooted some time ago by the Foreign Minister, needs pursuing despite the fatuous warnings about spies and what not (yes, it is incredible how many otherwise intelligent people subscribe to these fantasies). And, at a wider level, some encouragement should be given to Indians to travel eastward, a movement which would sensitise us to what goes on in the region. We were once worried about being misunderstood. Those days are gone.

Complex Situation

When one realises how much energy will have to be expended to achieve even these rather minor improvements in our approach to our neighbours, then the scale of the effort required to mobilise the non-aligned at this moment of disarray and disunity can be appreciated. When Jawaharlal Nehru and Krishna Menon set out in the fifties to organise the non-aligned nations in a world divided into two hostile blocs the task was simpler. Today's complexities are forbidding — and, often, demoralising. But India cannot remain moralistic and passive, aloof from rough contests on the ground.

Of course, the problems of political management at home impinge on coherent action externally. If we jog along with a patch-work government, deluding ourselves that all is well so long as Indira Gandhi and her son are kept on the run, we will end up doing acrobatics like the Arabs who threaten to cut the oil to Egypt, but pump it to the USA which arranges Egypt's compact with Israeli. A sad fate for South Asia.

March 17

Sales Effort Pays

Hansavivek

MADRAS RUBBER FACTORY has achieved a complete turnaround in 1977-78, with sales shooting up from Rs 45.44 crores to Rs 53.36 crores and yielding a gross profit of Rs 314 lakhs compared to a trading deficit of Rs 93 lakhs of the previous year. After depreciation, there is a net profit of Rs 119 lakhs against a net loss of Rs 183 lakhs. This pleasing outcome has enabled the company to return to the dividend list. The 10 per cent payment is covered 3.22 times by earnings. Contributing to the company's success in pulling itself out of the low ebb it had hit in the preceding two years has been the all-out effort to improve product quality and widen distribution network. Today MRF has 2,750 dealers and 29 depots covering 1,800 cities and towns. In addition, it entered into an exclusive arrangement with Hindustan Petroleum whereby all HP filling stations stock only MRF tyres. This has given the company 3,000 ready-made retail outlets all over the country. After analysing regional preferences patterns, the company launched its new truck tyre which is fast becoming popular with traders and customers. The company exported Rs 220 lakhs worth of tyres during 1977-78. It achieved a major breakthrough with Piggyback tyres for trailers in the US market as original equipment. The future looks even more promising, since the transport industry has greatly improved and the market potential for the tyre industry has increased. The company has now set before itself an ambitious sales target of Rs 100 crores for the current year. The first quarter sales of Rs 23.32 crores provide confidence to the management that the target will be achieved. The company is working hard on the radial tyre project. Car radials are already on its production lines and these will be followed by radial tyres for trucks.

PRESSURE COOKERS, which made a public issue of shares in July last, has extended the accounting year by four months to September 30. The accounts for the latest 16-month period, though not strictly comparable with those of the previous year, are very poor. Gross profit for 16 months is a shade lower than the previous 12 months' despite 50 per cent higher sales. Net profit is Rs 29 lakhs (Rs 26 lakhs). As indicated in the prospectus, the directors have not recommended any final dividend. The 20 per cent interim dividend declared before making the public issue is covered 2.23 times. The directors' report does not give any indication as to what has caused such a sharp deterioration of margins. About the current year's prospects, however, the directors say that performance so far has been good and that they expect the company will be able to maintain 20 per cent dividend on the enhanced capital. The company had offered 1,80,000 new equity shares of Rs 10 each and the then existing shareholders 2,02,600 equity shares, both at a premium of Rs 2.50 per share, to the public for subscription under a

prospects. The issue was subscribed 12.0 times. The holding of the founder Vasudeva family consequently came down from 97 per cent to 51 per cent.

STEEL AND ALLIED PRODUCTS, which has sunk deep into the red, is being rescued by banks and financial institutions. It is proposed to draw up a scheme of reconstruction covering rationalisation, modernisation and diversification as also capital restructuring. Meanwhile, they have agreed to provide incremental working capital of Rs 1.22 crores including margin money for sustaining the plan of operation of the company for the current year. In addition, they have agreed to give concessions by way of converting the advance relating to non-circulating assets to a term loan, extending moratorium on payment of interest on the inoperative accounts and funding of the interest during the current year. The fixed assets of the company have been revalued and the difference between the book balance and the present value, aggregating Rs 4.38 crores, has been taken into capital reserve. During 1977-78, the company incurred a fresh loss of Rs 1.58 crores which after certain adjustments increased to Rs 1.82 crores. With this, the accumulated loss has mounted up to Rs 4.09 crores. In addition, there are arrears of preference dividends amounting to Rs 24 lakhs. The company's share capital is Rs 1.22 crores and reserves (excluding the addition made on revaluation of assets) are Rs 57 lakhs. The company has identified obsolete, a slow and non-moving finished goods, stores and spares, raw materials and receivables estimated at Rs 1.81 crores. These assets are being physically segregated and steps have been taken to dispose them of soon.

TATA CHEMICALS' operating results for the half-year ended December 31, 1978, are poor. While sales are modestly lower at Rs 17.74 crores against Rs 18.48 crores of the same period last year, profit before tax has dropped from Rs 4.67 crores to Rs 4.04 crores, reflecting pressure on margins. With interest on borrowings requiring Rs 109 lakhs (Rs 72 lakhs), the gap has widened and gross profit is Rs 2.95 crores against Rs 3.95 crores. After providing Rs 2.06 crores (Rs 1.69 crores) for depreciation and Rs 22 lakhs (Rs 106 lakhs) for taxation, profit after tax has come down to Rs 67 lakhs from Rs 118 lakhs. This outcome, however, has not come as a complete surprise to the shareholders, since the management had forewarned them. Meanwhile, intensive efforts to overcome the problems and difficulties facing the company have begun to yield results According to D S Seth, Deputy Chairman and Managing Director, the performance of the second half-year should be much better and make up for the shortfall in the first six months. He also views the long term prospects with optimism.

JYOTI CONSULTANTS, Baroda, has been established for rendering consultancy services in an integrated form in various fields of business and socio-economic activities. It provides comprehensive service right from generation and testing of new ideas, feasibility studies, financial and organisational planning to project engineering and procurement, supply, erection and commissioning of plant on a turnkey basis. It also offers special services to public institutions and government development agencies in formulation, implementation and monitoring of programmes for sectoral and area development and in enhancing their organisational competence to manage such programmes satisfactorily

RALLIS INDIA, after staging a remarkable turnaround during the year ended August 1978, is now looking ahead to produce "substantially better, even record, results" this year. The company's sales for the first five months ended January 1979 at Rs 61.51 crores have been about 13 per cent ahead of the same period last year and profit-wise the company has "never done better during the first five months of any year than it has done this year", according to the chairman, D S Seth. Having cut the dead wood by closing down the bone mill at Magarwara and SIL processed food operation in Bombay, effective steps have been taken for the disposal of the company's interest in Hemalatha Textiles. Efforts are underway to overhaul, reorganise and expand the company's operations in permissible directions The subsidiary, Ralli Machines, which showed substantial losses, is now filling up spare capacity with contract work for third parties which will improve th company's profitability As known, the company is paying a dividend of 15 per cent on equity capital expanded by a one-for-five rights issue and by a three-for-ten bonus issue. The company had skipped dividends for 1976-77.

TI CYCLES OF INDIA, has developed a few useful new devices. One of them is LPG scale-cum-stand which is very useful for a housewife using cooking gas in the kitchen. With this equipment she can mark the day when the gas cylinder is likely to be empty and order the next refill much in advance. She can also check up whether the cylinder, when it comes from the distributor, contains the specified weight of gas. This equipment won a National Award for 1978-79 from the Society of Industrial Designers of India for excellence in design. Another device is a pedal pump. The company has designed a pumping set as an accessory to the conventional bicycle which can be used to pump water from a well having water level upto 28 feet depth from the ground level. Also a plunger type lift pump has been designed for deeper wells. Pedal pump can also be used to spray pesticides on plants and paddy fields. A cycle exerciser has been designed by the company to suit professionals and other office workers who can undertake optimum physical fitness exercises in the privacy of their homes. It is also ideally suited for hospitals, health clubs, gymnasiums, sporting clubs, institutions, colleges and schools. Yet another device is TI-20, which is a departure from the conventional design of the large wheel bicycle. This will be particularly welcomed by women bicyclists of all ages. The frame is designed to accommodate the saree and other long apparel.

ADVANI-OERLIKON made a comprehensive presentation of welding consumables and outfits, heat treatment equipment, industrial electronic controls, wire-cutting machines, etc, at the IMTEX-79, the fourth All-India Machine Tool Exhibition in Bombay. Most of the equipment displayed at the exhibition have been developed by the company through intensive research and development activities. The company entered these equipments for Perfect Machine Tool Trust cash awards as some of the most innovative machine tool designs of the year.

NEW DELHI

Wasted Technical Manpower

B M

THE question of upgrading technology and R and D is an important one. It can also become an alibi for extending and enlarging collaboration arrangements for foreign technology transfer. Even as Bharat Electricals is in the final stages of entering into a 15-year deal with Siemens of West Germany and has been questioned in this light, the signing of a comprehensive 15-20 year agreement on economic and technical co-operation with the Soviet Union, at the time of Soviet Prime Minister Kosygin's visit, sanctifies similar arrangements in other areas — particularly in the ferrous and non-ferrous metal industries.

The merit or otherwise of these specific arrangements apart, any real long-term advantage from them crucially depends on the extent to which indigenous R and D is developed. This remains indeed the Achilles heel in this vital area of the process of modernisation of the Indian economy. The report of the first study of scientific and technical manpower engaged in R and D in the country should therefore be of considerable interest. The survey was conducted in 1975-76 by a special group headed by P R Sengupta of the Institute of Applied Manpower Research

While the overall science and technology manpower in the study-period was around 1.5 million, those employed for R and D were estimated at 60,000. Of these, about 32,000 were covered by the study, leaving out those working in the defence R and D establishments and others working in those that did not respond to the questionnaires sent by the team. The study covers, separately, R and D manpower in research institutions, R and D in the public and private industrial sector, and R and D in universities and academic establishments.

The institutional sector reviewed covers over 85 per cent of R and D establishments in the country — among them, BARC and those under the various national councils such as CSIR, ICAR, ICMR and others. These accounted for the bulk of the country's manpower employed in R and D — about 23,700. BARC alone accounted for over 7,000 persons out of these. However, not all of them do actual research or designing. In the study period, actual research personnel accounted for 51 per cent in BARC and 76 per cent in all other areas. The rest are listed as 'auxiliary personnel' who provided technical and workshop services. A low percentage of auxiliary S and T personnel is, according to the report, indicative of the fact that a good proportion of the professionals "may really be engaged in auxiliary functions and as such are underutilised". Moreover, "design and development oriented programmes generally consume more technical services than do basic research programmes".

One of the more serious faults pointed out by the study is that, in most areas, expenditure on administration and clerical staff is more than what is spent on technical services. The only exception is BARC where expenditure on equipment is the highest (33 5 per cent) and that on administrative personnel is the lowest (4.5 per cent) The average figures for all the other establishments are: salaries of R and D personnel 29.5 per cent; salaries of personnel providing technical services 8.1 per cent, salaries of administrative personnel 10.7 per cent; equipment 22.9 per cent, and others 28.8 per cent.

The survey also shows that "more than 10 per cent of the doctorate degree-holders are occupying positions usually held by undergraduate diploma-holders or semi-professionals As far as utilisation of the professionals in R and D personnel 29.5 per cent; salaries that as many as 59.1 per cent bachelor's degree-holders in agriculture and veterinary science, 52 9 per cent master's degree-holders in natural science, and 34.3 per cent bachelor's degree-holders in engineering and technology, are placed in the two lowest salary slabs meant generally for technicians and non-professionals "

The salary structure is found to be pyramidal with a few people on top (only 9 in 23,700 above Rs 2,500 and 108 in the salary scale Rs 2,250-2,500, almost all of them administrators). The apex for personnel engaged in full-time research lies below Rs 2,250. According to the report, "one of the major defects of the pyramidal pattern is that it limits the scope of both intellectual and career development for the young, promising scientists". This is one of the reasons why few professionally qualified people are drawn towards R and D.

Taking another recent survey among the alumni of IITs which were created primarily to cater to the need for R and D technologists, it is found that less than a third of their graduates and post-graduates go into R and D.

The study of R and D in the industrial sector covered 26 out of the 34 public sector enterprises of the time and 60 of the 179 private sector establishments having R and D divisions. In the establishments covered about 1,600 persons were employed in public sector R and D and about 2,300 in private R and D.

The report shows that research efforts in Indian industries — particularly in the private sector — are concentrated on business R and D, and that mainly quality control rather than technology development and innovation. Indeed, in a number of cases, routine testing, trouble-shooting (on the production line), and even blueprint copying (of imported shelf-technology), are included as R and D activities, particularly in the private sector.

Similarly, while the proportionate expenditure on R and D personnel is comparable in both sectors, that on equipment is considerably lower in all the research areas in the private sector. However, the private sector has a better ratio of technical service personnel to researchers than the public sector. As the report points out, this may be due to emphasis on business R and D which consumes more technical service.

The study shows that the correlation between the earning and the level of education is poor in private sector industries, where a considerable proportion of undergraduate diploma holders and bachelor's degree-holders are found employed in the highest salary slabs in preference to master's degree-holders. Also, it points out that only a small proportion of engineers and technologists have doctorate degrees and that there is hardly any difference between the earning patterns of master's and bachelor's degree-holders.

The estimated expenditure on R and D in 1974-75 in the public sector was Rs 11 crores (0.6 per cent of the total sales turnover for the year) and that in the private sector was Rs 26 crores

(less than 0.1 per cent of the total sales turnover). The report points out that the "average expenditure on R and D in the industrial sector in the developed countries is much higher, being around 1 per cent of the total output".

According to the report, the R and D efforts of industry hardly match the expenditure in research institutions (referred to earlier) on basic development of manufacturing processes, which is estimated at around Rs 95 crores. In the absence of a matching effort, innovations in the research institutions cannot make any appreciable impact on industrial growth or on development of indigenous technology.

The findings of the survey are unlikely to influence science and technology policy very much. A policy draft which was recently prepared and is in circulation seems more concerned with sterile arguments on priorities whether between agriculture and industry or small and big industries, or indigenous research and import of technology. The problem of mobilising and organising the vast resources of technical manpower which have been generated in the last two decades for development activity is one which can hardly be resolved in a piecemeal manner even as the market is left to determine its own preferences of products and technology.

LABOUR

Jute Workers' Empty 'Victory'

Timir Basu

THE 49-day old strike by some 2.20 lakh jute workers was called off following a tripartite settlement on February 22. The agreement has taken effect only from February 1, though the last tripartite agreement had expired on December 31, 1976. The workers have thus been deprived of the benefit of higher wages over a period of more than two years. This was clearly a victory for the Indian Jute Mills' Association (IJMA) and, what is more, a victory by default since neither the unions nor the government insisted on a discussion of this important question.

Even otherwise, the balance-sheet of the settlement is heavily biased in favour of the millowners. The victory celebrations by the CITU and its allies are thus one more example of self-deception. This time the AITUC, snapping its earlier ties with the alliance formed through the initiative of UTUC (Lenin Sarani) and the INTUC, joined the victory rally, perhaps under the compulsion to build up a joint political platform between the CPI and the CPI(M) against the backdrop of the Viet Nam crisis. All other central trade unions expressed their unhappiness over the 'agreed' points as well as the manner of conducting the conciliation proceedings. The agreement was signed only on February 22, but the CPI(M) labour minister of West Bengal allegedly gave the impression to certain sections of the mass media on the evening of February 21 that an agreement had been reached as per his formula. The reality is that the final round of talks started on February 21 noon and went on till mid-night without any understanding. The minister's action would suggest that the government had decided in advance to impose the package deal, leaving the parties concerned to duel for some time.

The nature of the settlement could not be different considering that both the state government and the CITU and its allies had, from the start of the crisis, tried to woo the IJMA, even as the labour directorate of the state government had sought to pressurise labour to reach an amicable settlement. The CITU in fact had not been in a mood to even go on strike. This was clear from its 40th annual conference. The present agreement has relieved the government of embarrassment for at least three years as it is agreed that the settlement shall be in force upto December 31, 1981 and continue to be effective even further till it is terminated by statutory notice.

As per the new agreement, the minimum wage inclusive of DA and basic pay will rise by Rs 47.50 and has been fixed at Rs 470.10 per month of 208 hours of work in 26 days. For calculation of DA, the average consumer price index for the working class, Calcutta, with 1960 as the base, has been pegged at 300 points, which will be considered as the floor level. Henceforth the rate of neutralisation will be Rs 1.30 instead of Rs 1.15 for a rise of 12 points at the end of each quarter, in February, May, August and November. Full neutralisation of rise in cost of living can be achieved only if the rate is raised to Rs 2, but even the unions had demanded only Rs 1.55 and, in the course of conciliation, they further scaled it down to Rs 1.50. Though the draft of the agreement was reportedly prepared under the active guidance of the CPI(M) labour minister, it did not perhaps dare to go beyond the Bhoothalingam panel's recommendations. Hence the award of Rs 1.30. But for a rise or fall between 300 and 335 points, the adjustment will continue to be at the rate of Rs 1.15 per point. From the DA point of view, the agreement is, therefore, far from satisfactory.

This is quite apart from the fact that every year workmen lose a substantial amount due to faulty computation of the price index. The 1960 price index series is full of defects, just like the earlier ones. It was introduced in 1968, four years after the family budget survey on the basis of which the series was compiled. The family budget survey was conducted in 1958-59, but the base year is 1960. Further, the budget enquiry was not at all representative. The weighting diagram too hardly reflects reality. The 1960 series has been serving as a factor depressing workers' wages ever since it came into existence. After a number of representations, an expert committee, popularly known as the Bhattacharjee commission, worked out a comprehensive formula correcting the defects to some extent, so that the DA paid to workers would reflect somewhat better the rise in cost of living. However, the then Ray ministry invoked the DIR to shelve the recommendations of the commission. What is more surprising is that the CPI(M)-led government has failed to revoke the Ray ministry's orders. Had the orders been revoked and the Bhattacharjee commission's recommendations enforced, the workers would have got a DA rise of Rs 65 p m — exactly the amount which the jute workmen will now get under different heads after the settlement.

After a long tug of war, the IJMA has conceded the demand that the House Rent Act be implemented, but not before it was agreed that rent equal to 50 per cent of the house rent allowance given to a worker would be recovered from the wages of a worker who lives in company quarters. (These so-called company quarters are mostly barracks.) Workers will thus get Rs 15 as house rent, while those living in company quarters will have to be satisfied with half the amount. The

house rent allowance is, of course, ridiculously small in comparison with prevailing market rents.

Regarding the workload, which had been tremendously increased during the Emergency, the *status quo* will be maintained as per clause 4 of the settlement till finalisation of the issues which are to be referred to an expert committee. The committee is supposed to submit a report within six months of its formation. But such committees generally take much longer that the stipulated time and even then if the recommendations go in favour of workmen, the treatment meted out to the Bhattacharjee commission might be repeated. The reference to the expert committee is thus just a way of evading the problem. Meanwhile, the reality is that the workers are being forced to continue with the Emergency workload.

The question of grades and scales of pay too has been hanging fire for quite some time. In every wage settlement this issue is simply overlooked. The same thing has happened this year too. Again a committee is to be formed to review the entire situation, taking "all relevant factors" into consideration. One may be certain that the committee's recommendations will not be finalised within the term of this agreement.

The most unsatisfactory aspect of the agreement is the complete negation of the Raghunath Reddy Award on badli workers. The jute industry cannot run without badli workers, as 10 to 30 per cent of workers who mainly hail from upcountry areas are always on leave. However, for the better part of the year the badli workers do not have any work nor are they eligible for any benefits during the period of unemployment. Uncertainty about release of vacancies is so great that they cannot leave the place for fear of losing the badli job. Under the Reddy award, badli workers would have been entitled to Rs 1.60 per day during the lean periods. Implementation of the Reddy award was one of the major demands of the jute workers, but the CITU and other unions have accepted the continuance of the existing system. Thus clause 18 of the settlement reads, "It is agreed that in respect of matters not covered by this settlement, the existing system, practices and privileges shall continue". This means that all the demands of workers not specifically referred to in the agreement have been rejected and the workers have been deprived of even the right to agitate over them. The workmen will also no longer be able to agitate over bonus for the accounting year 1974-75 which had been denied to them during the Emergency.

Another clause in the agreement which is likely to be equally detrimental to the interests of the workmen is clause 13. This clause relates to counter-demands placed by the management at some stage of the conciliation. It reads: "It is agreed that employers' proposals regarding introduction of 19-20 shifts and the abolition of unpaid holidays will be left to the good offices of the labour minister whose decision will be binding. Till settlement of the issues, 'status quo' will be maintained." Normally 18 shifts are possible in a 6-day week. So the management is left only with the unpaid holiday to implement its programme of additional shifts. Mills would not recruit extra hands nor will badli workers be invited. Then how will the additional shifts be worked? With rotational unpaid holiday, a sizeable portion of the workforce will be taken out to man the extra shifts and the reduction in the workforce will be done in such a way that the quantum of production of each shift remains unaffected. In short, a seven-day production schedule against payment of wages for six days is the net result of this arrangement.

Reinstatement of victimised workers has again been left to be settled through the good offices of the labour minister. "The labour minister's recommendation in this matter. which will be given within two months, will be final and accepted by the parties." But it has also been stipulated that the "number of such names [i e, the list of victimised workmen] will not exceed 55" — irrespective of the actual number of victimised workers which is very much larger. Even if the labour minister finds time to clinch the issue within the stipulated two months, a large number of workmen will stay victimised and will not be reinstated in their jobs.

The only benefit that the jute workers have gained through this settlement is the right to gratuity as per the *relevant Act, which has all along been* denied to them even though it is a statutory obligation on employers. Henceforth workers will be entitled to 15 days' gratuity in place of 13 days. This applies both to time-rated and piece-rated workmen. The *status quo* regarding the period of wage payment will yield some marginal benefits. But for gains are insignificant. Yet it has been all practical purposes the workers' hailed as a 'victory' for the workers.

CONGRESS PARTY

Reappointment of the Heir-Apparent

M H J

THE Congress(I) Working Committee decided last week to convene a meeting of its AICC on April 21 and 22, six days ahead of the AICC meeting of the rival Congress led by Swaran Singh. This decision to hold the first ever AICC(I) meeting is obviously intended to further legitimise the party's claim that it is the 'real' Congress.

The move follows the breakdown of the talks over the reunification of the two Congress parties. The unity efforts crashed on the rock of Indira Gandhi's insistence that her son, Sanjay Gandhi, should have a place in the united Congress and that the united Congress would have to launch immediately struggles against the Janata party and its government to defeat the designs to proceed against her and her son and jail them. Indira Gandhi had told Swaran Singh that her party was agitated over the special courts bills and over the rightful place for Sanjay Gandhi in a united Congress and that "these two national issues" would have to be the main part of the programme of a united Congress. Since Swaran Singh was reluctant to commit his party to such conditions for reunification, Indira Gandhi lost interest in the unity (which she always saw as the 'merger' of the Congress into her party). She also realised that even after unity, the 'other half' of the Congress would always remain opposed to her and her son and a situation might arise when she would have to once again walkout of the Congress and form her own party. Hence it was better to continue with the separate entity of the Congress(I). The objective of calling the AICC(I) is to provide a platform of the AICC to those desirous of joining her and attract as many Congressmen from the other side as possible, particularly in the states.

The Congress(I) Working Committee has also decided to revive the Youth Congress and restore to it the pre-eminence in Congress politics that it had acquired before and during Emergency. After the defeat of the Congress in the March 1977 Lok Sabha poll (the entire blame for which was heaped on Sanjay Gandhi) the Youth Congress was made the wing of the Congress and was prohibited from enrolling membership and collecting funds. That decision has now been reserved and the Youth Congress is to have a status independent of the AICC(I), free to collect funds and enrol members separately. According to A R Antulay, AICC(I) General Secretary, the 'unanimous' decision of the working committee was preceded by a discussion dominated by UP, Haryana and Punjab leaders who argued that "the Youth Congress should not be regarded as a limb of the Congress but a living body" and who carried the Working Committee with them. The Working Committee has appointed a five-member committee to recommend a 'role' for the Youth Congress; and except for Devraj Urs, the rest of four members — Chenna Reddy, Umashankar Dixit, V P Sathe and Ramachandra Rath (convenor of the Youth Congress) — are expected to do the bidding of Indira Gandhi.

Antulay also announced that none in the Working Committee suggested that Sanjay Gandhi should actually take over the leadership of the Youth Congress; it is precisely for this reaup before the Working Committee. But neither did anyone in the Working Committee say that Sanjay Gandhi should not take over the leadership of the Youth Congress. It is common knowledge that Sanjay Gandhi will take over leadership of the Youth Congress; it is precisely for this reason that Indira Gandhi made the Working Committee accept the 'independent' status for the Youth Congress which after all is the creation of Sanjay Gandhi. Indira Gandhi has been preparing ground since long. It was not for nothing a statement was recently issued by the AICC(I) office in the name of one Vats, head of the panel of doctors attached to AICC(I), that Sanjay Gandhi should be brought back in the Congress(I) and made the leader of the youth to fight the communal forces represented by the RSS. The statement which could not have been issued without the permission of Indira Gandhi came on the eve of the breakdown of the unity talks between the leaders of the two Congress parties. According to the decision of the Working Committee, the Youth Congress will be the vanguard, leading the Congress(I) in pursuing its policies of fighting the communal organisations like the RSS and implementing the programme of democracy, socialism and secularism.

Indira Gandhi's plan to reinstate her son in politics and restore him to pre-eminence in the Congress(I) via the Youth Congress is obviously not liked by her partymen; but they cannot — or do not want to — voice their resentments lest they lose their jobs. Through Antulay, Indira Gandhi has made it known that she does not wish to associate herself and her party with Raj Narain's 'crusade' against the former Jana Sangh and the RSS. Antulay also said that Indira Gandhi could not be expected to join hands with Raj Narain and others who earlier had in collusion with the Jana Sangh and RSS opposed her since it then politically suited them.

Evidently, Indira Gandhi is not in a hurry to forgive Charan Singh who, with certain well-publicised overtures to her, gained re-entry into the Union Cabinet. Indira Gandhi thought, wrongly, as it has turned out, that she could align with Charan Singh and his BLD group to unsettle the government at the Centre. The impression was created that she and Charan Singh were very close to forming an alliance against Morarji Desai. But Charan Singh, to the great embarrassment of leaders like Madhu Limaye and Raj Narain even more than of Indira Gandhi, made up with Morarji Desai. Perhaps for the first time in her political life, Indira Gandhi was outwitted and was used by someone else.

However, whatever public postures Indira Gandhi might have maintained *vis-a-vis* Raj Narain on the latter's campaign against the Jana Sangh and the RSS, the fact remains that she sent Sanjay Gandhi to meet Raj Narain on March 16. In Raj Narain's words, "Sanjay is a good man and came to meet me on his own". He met him to thank him for his campaign against the RSS.

Evidently, Indira Gandhi aims at fragmenting and weakening the Janata Party by fomenting troubles among and within the different constituents hoping that the shrill open quarrels in which these factions have been engaged will eventually discredit them in the eyes of the people. She also realises that the older generation of leaders in her party are incapable of any street agitation, and that only Sanjay Gandhi and his Youth Congress can launch struggles against the coming Special Court trials.

Centre's Inequities

WEST BENGAL'S Left Front government has not packed its second full-term budget with surprises. It makes a bold effort to raise additional resources, picking its targets with care and, by and large, with imagination. The budget does not also contain any sharp ideological sting and is generally content with spreading the tax net widely, *albeit* rather lightly. But it reserves some of its strongest expressions to criticise the attitude of the Union government towards West Bengal in particular and the states in general.

The budget provides for additional taxation of Rs 37 crores during 1979-80 of which about Rs 8 crores are to be collected from octroi and would have to be passed on to the Calcutta Metropolitan Development Authority (CMDA) under a standing arrangement. Together with a negative opening balance of Rs 55.82 crores, the coming year is projected to end with a deficit of Rs 84 crores. The figure can conceivably go up if the Centre backs out of what state government spokesmen describe as its "commitment" to meet the outgo of Rs 30 crores incurred on account of a hike in its employees' dearness allowance rates, now brought on par with the rates enjoyed by the Central staff.

The situation is not comforting. And this is but natural in a state ravaged by a disastrous flood in September-October last, a wobbly economy still fighting with the deadweight of stagnation, and an uncomfortable burden of a large and growing family of sick units and disintegrating industries. Understandably, the Finance Minister, Ashok Mitra, has been tempted to take credit for the fact that the growth rate achieved during 1977-78, the first year of the new government, has been remarkably high. During the year the state's aggregate income rose by 8.93 per cent — the highest since 1963-64 — and its per capita income spurted by 6.56 per cent, the highest since independence.

And all this has been achieved, as Ashok Mitra said, in the face of heavy odds. First, he cites the case of the state's Plan size. For 1978-79, the Plan was restricted to Rs 371 crores which, considering the state's resource mobilisation efforts and its developed industrial infrastructural backdrop, was itself on the low side *vis-a-vis* the figures decided for many other states. But worse is to come. For 1979-80, the state government has drawn up a plan of Rs 531 crores. But according to the Planning Commission, it should not exceed Rs 370 crores which would mean a fall from the preceding year's figure. In Ashok Mitra's words, the situation is "unprecedented", which indeed it is.

The Centre's stand apparently is that with a Plan size of this magnitude, West Bengal will be forced to fall back upon Central assistance on a much bigger scale than what is envisaged. The state had to take a Central loan of Rs 105 crores during the current year when it ran into a serious ways and means problem. New Delhi apparently is keen to see that such problems do not arise often.

But as Ashok Mitra says, this is highly discriminatory. Having ways and means problems is not something bily the state and its neighbours have not stood in the case of most other states from asking for ambitious annual plans and getting away with them. The Finance Minister told newsmen on budget day, striking a pose of characteristic militancy, that if it comes to that, the Left Front would tell the people of the state of the Plan incongruity, organise them to rise and fight against it and "if New Delhi must thrust it upon us, it will have to do so over our dead bodies".

The second major point he made out in his budget speech was how shabbily the state and its neighbours have been treated by the all-India financial bodies. During the seven-year period of 1969-76, the per capita bank credit advanced was only Rs 24 for Orissa, Rs 40 for Assam, Rs 19 for Tripura, Rs 38 for Bihar and Rs 146 for West Bengal. By contrast, the figure for Punjab was Rs 346, for Maharashtra Rs 308 and for Tamil Nad Rs 203.

Ashok Mitra rolled out more statistics to drive home the point. The Life Insurance Corporation's per capita investment during the same period was Rs 16 for Assam, Rs 23 for Orissa, Rs 5 for Tripura, Rs 14 for Bihar and Rs 17 for West Bengal; against these, the amount for Gujarat was Rs 52 and for Haryana Rs 55. The distribution of loans from term-lending institutions also conformed to the same pattern.

Such then is the anatomy of poverty of the eastern states. Ashok Mitra said: "An arrangement was thus set which was self-aggravating; the eastern region was denied any sizeable public sector outlay under the Plan and, at the same time, funds from banks and financial institutions were also made scarce, so that little possibility existed of any significant headway being made by any of these states in the industrial, commercial and agricultural sectors. And once their rate of growth was slowed down in this manner, this poor rate of growth could be, and in fact was, made the alibi for further lowering the share of Plan funds and institutional resources for the eastern states .... The feudal and monopoly elements which have dominated decision-making over the past thirty years had discovered to their own satisfaction a rationale for under-emphasising investments in the eastern region, probably based on the fact that this region, of which West Bengal has been the vanguard, has led the battle against the forces of reaction, including reaction in the economic sphere". It would be interesting to hear from the concerned authorities as to what they have to say on the points made out in the lengthy quotation.

Anyway, Ashok Mitra has already given advance notice that he for one is not willing to accept this state of affairs. He has accused vested interests, working in connivance with New Delhi, of keeping the revenue from additional excise duties on sugar, textile and tobacco to just about 6.8 per cent of the value of clearance in 1977-78 against the commitment of 10.8 per cent. Unless the situation is corrected, then from fiscal 1980-81, the additional excise duties would not be operative within West Bengal.

Coming to the more immediate problems of the state, the budget makes two major innovations. One is the introduction of a kind of state-level income tax (up to a maximum of Rs 250 per annum) from all those employed in trades, professions and services. Something like this is already in force in Tamil Nadu while a professional tax is in operation in Maharashtra, Orissa and Karnataka, among other states. The other new tax introduced in the budget is on turnover. Registered dealers under the sales tax acts will have to pay a turnover tax between 0.5 per cent (on a turnover of Rs 50 lakhs to Rs one crore) and 1 per cent on a turnover of over Rs 1 crore. The budget has also made education free up to the school leaving stage against up to class VIII as at present.

But a few other aspects of the budget need to be watched a little more carefully. One is the unemployment allowance scheme, introduced in the last budget, of paying Rs 50 monthly to the unemployed of over five years' standing; against this, they are expected to take part in some social or develop-

... About [illegible] young men and women have so far benefited from it and another 55,000 are likely to join in by next year. But the question that is being asked in some circles is, could not the sum of about Rs 8.4 crores to be spent on this account be put to more purposeful uses that could have added to the productive assets and also ensured steady income to the young people (like setting up small scale units, road transport co-operatives or selling and supplying agencies)? Would not injection of such an amount every year without any corresponding productive returns lead to inflation? What is more, how could the Left-Front to be so sure that the well-intended gesture would not boomerang on it?

The other issue concerns the rise in the DA rates for state government employees. As a result of the new party (the scales of basic pay of course still differ), the monthly salaries of the state government employees go up by a minimum of Rs 22 and a [illegible]. At the upper level, a [illegible] belonging to the state cadre will thus now be drawing just about Rs 100 less than the secretaries of departments who mostly come from the Central services. Some of the secretaries are known to have started wondering if it is worth taking all the trouble just for such a meagre differential. Some private sector employers are also having misgivings if their employees too would not take the cue from their 'sarkari bhais'.

WEST GERMANY

Fresh Strains in Relations with US

Ramesh Jaura

US-WEST GERMAN relations which only recently recovered from the strains caused by the controversy over the neutron bomb, are once again strained — this time over the placing of nuclear-tipped intermediate-range missiles on West German soil. These come under the 'gray zone' of weapons which are not the subject of negotiations between the Soviet Union and US.

Most active in the fray is Herbert Wehner, the parliamentary leader of the dominant coalition partner SPD. In a series of radio and newspaper interviews, Wehner has questioned the NATO view that Soviet arms bulid-up is offensive. He has blamed the West in general and Foreign Minister Genscher in particular of mishandling the protracted MBFR negotiations in Vienna. Short of asking for West German exit from the NATO, the SPD party stalwart has warned against the dangers of a Washington-Bonn axis. Such an axis, according to him, was detrimental to the interests of peace and the security of West Germany.

Such views have evoked strong protests from the conservative CDU-CSU opposition. Its spokesmen have branded Wehner's views as "scandalous" and "unrealistic" and CDU chairman Kohl has even gone to the extent of charging Wehner with "sabotage". The use of such strong language is quite normal among political opponents in the FRG and the government and opposition have in fact been branding each other as "Sicherheitsrisiko" (security risk).

But the current debate is of a more fundamental nature. The opposition wants Bonn to ditto NATO strategy and intensify arms build-up. That alone could ensure security and peace. The coalition view is that efforts towards detente must continue and an avoidable arms build-up must be halted.

Differences such as these between SPD and CDU are not new. The opposition has been right from the beginning sceptical about the policy of detente. It was even opposed to signing the declaration of the Helsinki conference on European Security. Earlier, it dubbed the peace treaties with the East European countries as a sell-out of German national interests and a betrayal of all that democracy stands for.

The reason why SPD emphasises continued efforts towards arms control is the fear of annoying the Soviet Union which is already jittery over West's enthusiastic support for China's development efforts. The stationing of Pershing II rockets with a capacity to strike targets in the Soviet Union, it is felt, would create unnecessary complications in Bonn's relations with Moscow. It might strengthen the hawks in the Soviet Union who are said to be waiting in the wings to swoop on Brezhnev who badly needs success for his policy of detente.

Though genuinely convinced of stepped up efforts towards detente, the SPD-led coalition is not paving the path for "Finnlandisation" of West Germany, as the US President's security adviser Brzezinski suspects and the CDU-CSU opposition accuses it of. Bundeswehr Generals continue to hold some key posts in the NATO; and, young men who want to evade conscription do not at all have it easy against the authorities.

But the dominant view in the SPD is to undertake all the necessary steps in order to avoid West Germany being forced into a probable Third World War. Historical and moral grounds apart, the sheer certainty that FRG would have to bear the brunt of such a war necessitates a determined pursuit of detente.

This is precisely what Herbert Wehner said in an interview to a West Berlin radio RIAS during his recent visit to Hungary. Even Schmidt is known to share Wehner's views in private, though, his public postures tend to give a different impression. In the midst of current controversy, after a special cabinet meeting and later during a Bundestag debate, the Chancellor has let it be known that: (a) West Germany cannot, under law, possess atomic weapons and the decision to produce intermediate-range rockets with nuclear warheads is upto the US. (b) Deployment of such weapons in Western Europe must be a joint NATO decision. (c) Other Alliance members should also provide bases for the missiles. (d) Arms control efforts must continue.

Observers recall that even during the controversy over the neutron bomb, Schmidt had taken a similar stand. The unwillingness of Belgium to have neutron weapons on its territory was an important factor in stalling the US plan. Even in the case of Pershing II rockets, it is said, Schmidt is counting with the opposition of some western European allies.

Even some of Wehner's detractors admit that a flexible approach on the part of the NATO is necessary for MBFR talks to succeed. Chancellor Schmidt, they say, had favoured a moratorium on 'gray zone' weapons. But Foreign Minister Genscher put his foot down. "If he had not done so, Genscher would not be complaining about the increasing Soviet arsenal of SS-20 rockets", wrote the liberal Hamburg weekly *Die Zeit*. "Schmidt wanted to drop the issue of 'parity', but Genscher pressed the brake, with the result that not a single Soviet soldier has been withdrawn", added the weekly.

To that extent, the current missiles debate has another angle: the difference between the coalition partners, social democrats and liberals. FDP Economic Affairs Minister Otto Graf Lambsdorff has removed whatever doubts existed. During the recent two-day defence debate, Lambsdorff favoured an unconditional stationing of intermediate-range missiles in West Germany. He is said to be Genscher's successor in case the present foreign minister should decide to resign due to reasons of his poor health.

While the domestic nuances of the debate are important, its essential significance lies in the deterioration in Bonn's relations with Washington. The West Germans increasingly complain about the anti-German attitude of advisers who have the ear of President Carter. Besides, it is felt, the Carter administration lacks an understanding for serious West German concerns. Then there was the controversy over sale of West German nuclear power plants to Brazil, which Washington wanted Bonn to withhold or at least introduce an inspection clause. Lack of strong economic leadership in the US has often been a subject of criticism in Bonn. Americans, on the other hand, have been expressing irritation at what they feel is German arrogance, especially in economic matters.

But the fact is that the economic giant West Germany is no longer a political dwarf and refuses to be bypassed on issues of crucial national interest. Americans still find it difficult to reconcile themselves to this changed reality.

Towards a Free Press

Pran Chopra

THE terms of reference of the Press Commission accord the topmost priority to issues concerning the ownership of the press, the financial control of newspapers, and their management structures. This is borne out by the fact that three-quarters of the terms relate to these issues. It is welcome that the terms of reference should be so drawn up. If public opinion is a major lever in a democratic system, it is necessary to ensure as far as may be possible that everyone has a fair access to the channels through which public opinion expresses itself and to the platforms which educate, guide and influence public opinion. In so far as the press is one of these channels and platforms, fair access to the press must be ensured; anything which undermines or restricts this access for any group or interest, or confers undue control of this access upon any group or interest deserves to be countered.

This is the argument which is often, and rightly, used against government control of or even influence upon the mass media, especially the press. But it is time to ask whether, apart from *the government of the day*, there are other forces also which may be exercising undue control over access to the press and denying other forces their share of this access and whether ways can be found of countering them by means which are themselves democratic, free of partisanship and above suspicion of being amenable to special interests especially governmental.

Urban Phenomenon

More than in most other democratic countries, *the mainstream of the press* in India does not touch the mainstream of the population. The press is very largely an urban phenomenon, the population is largely rural, and the twain meet only at the periphery. Illiteracy is one of the barriers between the two streams; poverty is another. Most rural people either cannot read or cannot afford to buy a newspaper; and even among those rural people who are literate and relatively well off, newspaper readership is relatively small because the press is largely an urban institution, especially the more influential newspapers, whose outlook is important in the context of this argument.

The press remains urban for the same reasons for which it became urban in the first place — that politics, influence, money, and the propensity to spend (which generates advertisement revenues and thus chalks out the territory to be serviced by the press) were all city-based. Even to the small extent that they originated in the village, they had an urban orientation. So deeply ingrained has this bias become that the press remains an urban phenomenon even though political levers have sprung up in the villages too and some prosperity as well.

If the base of political processes shifts increasingly to the village and the base of the press remains in the city, the press will not only be disproportionately accessible to one section of the population and inaccessible to another, it will also become less relevant to the democratic process. Furthermore, this looseness of linkage between the press and the future mainsprings of the Indian democratic processes will not be remedied simply by the leading press magnates (as we know them today) with their deeply urban outlook and interests, expanding their circulations in rural areas or even starting new editions there. On the contrary, while their own biases will remain urban, they will be able, as things are today, to choke any competition which a genuinely rural press may try to present to them.

Sensitive Juxtaposition

There is another reason why it is *important*, and more important in India than in most other democracies, to ask whether the press and the democratic process are mutually reinforcing each other, whether anything can or should be done about it and whether it can be done by purely democratic means. India has decided to place a high priority upon the development of the public sector of the economy. On the other hand the press is very largely owned by the organised *private* corporate sector, whose main capital base is in non-publishing business and commercial finance. Therefore the socio-economic outlook of the Indian democratic process and the outlook of the press come into a sensitive juxtaposition. It needs to be handled wisely by all those who have a responsibility towards ensuring that the press functions and is seen to function as a genuinely free and democratic institution. Otherwise the political forces which for their own reasons are interested in restricting the freedom of the press will try to do so in the name of the freedom of the democratic process. They will be able to give the press the bad name of being the platform of rich, 'private', minority interests which try to use it for manipulating the political choices of poor, 'public', and *majority* interests.

Hitherto this juxtaposition has not been handled well either by the proprietors and managers of the press or by the political parties in power, whether at the Centre or in the states. The press feels that most parties, when in power, try to curb the freedom of the press because they find it uncomfortable to live with a free press. Most of these political parties on the other hand suspect that press barons, all of whom are seen to be lacking the kind of *people's mandate that* democratically elected governments are able to claim, represent the interests of the private sector and for that reason are hostile to governments committed to the development of the public sector.

Some of this mutual suspicion might be unfounded. But enoough of it is warranted by facts to lend colour to all of it. Proprietors do use the newspapers they own to put pressure upon the government on behalf of their non-publishing business and commercial interests. And governments also use their regulatory economic powers to put pressure upon those commercial and business interests whose newspapers are seen to be generally hostile to the government. Journalists trying to do an honest job are often caught in this crossfire, whether they criticise the government (which they do very often) or private corporate interests (which they criticise very sparingly).

Triple Aggravation

All these problems are aggravated as (i) an increasing proportion of the total circulation of newspapers is accounted for by fewer and fewer newspapers; (ii) more and more of the high circulation newspapers come to be owned by a decreasing number of successful publishing houses; and (iii)

more of the successful publishing houses come to be owned more and more by urban-based business and commercial interests whose main financial stake is not in the newspapers owned by them but in other and generally more profitable enterprises whose interests are then sought to be projected through the newspapers owned by them.

As this triple aggravation occurs, the ownership of newspapers comes to be increasingly identified in the popular mind with that small class of people who have capital to spare for acquiring newspapers. Correspondingly it becomes dissociated in the public mind from the large mass of the poor people who are the main numerical power base of most parties which have formed governments in India. This makes the juxtaposition between the press and the government even more sensitive, weakens the press by weakening its identification with the people, and embolden governments, as it has emboldened them in the past and might embolden them still more in future, to curb the freedom of the press in the name of the people.

The best remedy for this situation would be that the press itself should wake up to this danger and discover and apply correctives. That way it would fortify its freedom by its own efforts, which is in any case the best way to fortify any freedom. But experience does not suggest that the necessary effort will be forthcoming from within the press. In India no less than in other countries, the philosophy of freedom of the press has assumed to include unconstrained competition between unequal competitors.

So great is the resistance offered in the name of the freedom of the press to any mitigation of this aggravation that in US where concentration of the press is beginning to cause grave anxiety, even a discussion of the problem, let alone its resolution, has been resisted by the newspaper publishers' association. The problem is not mitigated either by proliferation of struggling and short-lived publications, many of which die because the existing conditions do not give them a chance of fair competition, or by the increasing spread in the circulation of a few powerful and affluent newspapers which are generally owned by an economically powerful but numerically small and narow-based class or group. On the other hand the problem, unless answers are found for it, will be further aggravated by the current trends in the economics of newspaper production. They are tilting the balance still more heavily in favour of those who have sufficient capital to build up such decisive economies of scale, that by attaining large circulations through high-cost production they can sufficiently reduce the unit cost to knock out those publications which cannot match their staying power.

'Free' Competition No Remedy

Therefore there can be no remedy for this problem within the four corners of 'free' competition. If genuine freedom of the press is to be safeguarded, then the responsibility for safeguarding it cannot be left to the press as we know it today. The means must be found outside the present institutions of the press if access to the press as a platform and as a channel is not to be further distorted by unequal competition.

Obviously the broad approach should be to reduce the advantage which the possession of a large capital block confers upon those who possess it, and to reduce the disadvantage which lack of capital inflicts upon those who lack it. Within that broad approach, however, tactics can vary according to local circumstances at any given time. Emphasis can vary from reducing the advantages which go with the possession of capital to reducing the disadvantages which go with the lack of it. Similarly the emphasis can vary from reducing the distortions which exist already in the access to the press to reducing the danger of such distortions becoming further aggravated and to preventing the occurrence of such distortions in future.

Past efforts in India, to the extent that any have been made at all, have concentrated mainly on reducing the advantages which capital has already built up in the existing press. Much less thought has been given to reducing the disadvantages resulting from the lack of capital in the future development of the press. This was a tactical mistake, aggravated by an attempt at direct governmental intervention. The resistance which organised capital could offer, especially through the press owned by it, was underestimated. The resistance proved especially effective because it was offered in the name of maintaining the freedom of the press against governmental intervention.

Future efforts should concentrate upon reducing the future disadvantages of lack of capital, and that too through non-governmental agencies though governmental backing would be necessary. Efforts to reduce this disadvantage in the present should receive the second priority. Reducing the advantages presently resulting from the possession of a large capital block should take the third place.

Assistance, Yes; Control, No

Of course, none of these efforts can be made without some initial governmental intervention and without running into some legal snags. Helping those who do not possess capital to compete less unequally with those who have it will necessarily mean discriminating in their favour in some ways. It will also involve the use of funds which initially can only come out of the public exchequer. But the discrimination would be no more questionable, in law or in morality, than the one presently practised, and for the same reasons, in favour of industries which

agree to go to rural areas, and to small enterprises in industry or agriculture. And the funds drawn from the public exchequer can always be immunised against governmental influences in their uses.

If lack of capital is the initial handicap the first step should be to make it available at reasonable cost. And the first step for that should be to restore a facility which for some inexplicable reason was withdrawn from publishing about ten years ago. Until that time, both printing and publishing enterprises, if they were small enough to qualify, were entitled to receive concessional bank loans and co-operative credit. Subsequently, publishing enterprises were excluded from this concession. The facility should not only be restored, but the bye-laws and rules governing it should be so framed, after thorough scrutiny by small-scale publishing interests, that they forestall backdoor influence upon the publication by the official agencies which administer the facility. One way of ensuring this immunisation would be to entrust the administration of this facility to a public trustee of the kind which will be proposed in succeeding paragraphs for certain other facilities.

Loans and credit, however, are only a partial remedy. In fact, in certain circumstances they can aggravate the handicap faced by those who lack finance of their own. Therefore, supplementary help should be ensured in the form of printing and distribution services for those who cannot initially purchase them with their own finance.

Municipal printing and distribution services should be created out of governmental funds but under a non-governmental public trustee. These should be hired out at concessional rates to these, at least in the early stages, who are small enough to merit the assistance. Other forms of assistance and the mechanics of giving it, are familiar to the government already: they include preferential allotment of printing paper and advertisements. But these facilities should also be transferred from the government's umbrella to the public trustee's in order to eliminate the suspicion of government's influence on the assisted publications.

Stringent conditions will have to be laid down for judging who qualifies for these forms of assistance, and the conditions will have to take account of many questions. How small (or rural) should a small publication be to claim that it qualifies? How should fake claimants be identified and weeded out? How should the performance of the assisted publisher be monitored to ensure that he does not continue to pretend to that size after he has outgrown it and at the same time does not refuse to grow in order to continue to receive the assistance? It may be difficult to find answers to all these questions but it is not impossible. Some answers exist already in comparable governmental experience. These can be improved upon, and others found.

Problems of Public Trustee

A tougher problem relates to the public trustee. Governmental assistance to other forms of enterprises is not as sensitive to the suspicion of governmental influence as assistance to the publishing industry can be. Hence the need for entrusting all the instruments of this assistance to the custody of an agency which would be, and would be seen to be, free of influence of the government and political parties and capable of inspiring public trust. The role and functions of the public trustee should grow by stages, as it gains credibility and experience and refines its methods. But the thrust of its role should neither be to dispossess any present owners of their publications nor to penalise them for being part of industrial or commercial empires or of chains or groups except to the extent that they would not be entitled to the extra facilities and concessions which the trustee would extend (and in matters like the allotment of newsprint and advertisements the government might extend under the supervision of the trustee) to publications which are free of these attributes of concentration of ownership or of ownership of a publication business by non-publishing finance.

The thrust should be to encourage and assist others as well to become publishers of small-and medium-sized periodicals and newspapers so that new areas, new groups, classes and points of view which do not have sufficient capital of their own may also gain fair access to the press, and the press may become a more widebased institution with a more diffused ownership pattern. But obviously the assistance should be limited to those who qualify for it by being, and remaining, independent of groups and chains and non-publishing finance. The assistance should cease as soon as the qualification ceases or independent viability is attained. Initially the assistance should be extended only to new publications But there is no reason why it should not be extended gradually to existing publications which qualify and even to those which do not qualify at present but are willing to shed their disqualifications by delinking themselves from *groups, chains and non-publishing finance.*

Last Priority for Growers

THE decision to export one lakh bales of raw jute of medium and low grades has been dictated not so much by a desire to help the domestic grower — anyway is unlikely since the grower has already sold his crop to the middlemen or, if he had been fortunate, directly to the JCI — but by a concern to reduce the mounting stock of jute. According to one estimate, out of a total production of about 81 lakh bales of jute and mesta in 1978-79, only about 65 lakh bales might be consumed by the mills; the offtake from the growers has only been around 57 lakh bales, because JCI is reported to have with it a stock of about 8 lakh bales. Also, the mills themselves claim to have substantial stocks lying with them following the strike in the jute industry. All in all, there is once again going to be a glut of jute and the proposal to export a lakh bales of jute is designed to marginally ease the situation.

The curious aspect of this decision to export raw jute is that it comes fairly close on the claim of the industry that the country actually needed to import raw jute. There were reports in December that pressures were being mounted upon government to go in for import of three lakh bales of raw jute. This again was entirely in character; as noted by the third report of the Committee on Public Undertakings of the Sixth Lok Sabha, on the eve of the raw jute marketing season, the industry regularly manages to bring about a closure of a number of mills on one pretext or the other for the express purpose of creating glut conditions in the raw jute market and depress raw jute prices; and such a situation had indeed been created towards the end of last year, with a strike being forced upon the workers.

Along with the decision to export raw jute, government has also decided upon the creation of a buffer stock of raw jute. But the tasks of laying down the modalities of formation and operation of the proposed buffer stock has been entrusted, strangely enough, to the Indian Jute Mills Association — an organisation which has a vested interest in ensuring the lowest possible prices for jute. The IJMA is supposed to administer the buffer stock jointly with the JCI. It is not certain if the proposal to have a buffer stock is not actually designed to defeat the move to export raw jute.

The crucial issue overlooked in all these plans for exports or creation of buffer stocks is how to ensure that these measures actually help the grower to realise better prices for his product. As noted by the report of the Committee on Public Undertakings referred to above, the JCI had generally been able to purchase only 9 to 11 per cent of the total raw jute production and even these purchases were made through middlemen from secondary markets and not from the growers. It is only in this season that the JCI has been allowed to go in for commercial purchase right from the beginning of the season, unlike in earlier years when it used to be asked to start its procurement operations only after many crucial months had passed and after the bulk of the raw jute had been already transferred from the growers to the middlemen and mills' agents.

Indeed, the decision to export one lakh bales of raw jute might not be even intended to help the grower, since he is anyway at the extreme end of the chain and the jute that is to be exported has long left his hands; but the proposal to build a buffer stock is of the most vital concern to the grower; and the task of determining the mode of procurement and the operation of the proposed buffer stock should be assigned to organisations which do not have a vested interest in keeping jute prices consistently low. Nothing that has been said on the subject till now suggests that the grower has been kept in mind; instead, the latest news from the government is that adequate bank finance might be advanced to the jute industry at concessional interest rates (of 8 to 10 per cent) to build the buffer stock; and even as these modalities of helping industry to stock its own requirements are being worked out, there has also been news that the raw jute market has started declining further for lack of buying support.

Producer Levy, Evasion and Income Loss

Empirical Evidence from Coastal Districts of Andhra Pradesh

K Subbarao

This paper seeks to assess the working of the producer levy scheme in Andhra Pradesh in the recent past, to examine the implications of converting this levy as a potential source of procurement in the state in the near future and to estimate the income loss, if any, sustained by farmers on account of the operation of the compulsory levies during the period 1973-74 to 1975-76.

DESPITE impressive growth of rice production in Andhra Pradesh since the introduction of the new technology, public procurement of rice as a per cent of output fluctuated significantly during the period 1966-67 to 1975-76. During the last three years of this period (1973-74 to 1975-76), however, procurement of rice was impressive owing primarily to the operation of the compulsory producer levy which accounted for 40-50 per cent of the total rice procurement in the said period (see Table 1). The object of this paper is to assess the working of the producer levy scheme in Andhra Pradesh in the recent past, to examine the implications of converting this levy as a potential source of procurement in the state in the near future and estimate the income loss, if any, sustained by farmers on account of the operation of the compulsory levies during the period 1973-74 to 1975-76.

I

Producer Levy and Actual and Realisable Procurement Potential in Good and Bad Years

The Andhra Pradesh government introduced a compulsory levy on producers for the first time in 1965-66, but the scheme was withdrawn totally after giving it a trial for barely four months. The levy was reintroduced in 1967-68 and was continued in the following year, but abandoned thereafter. A comprehensive scheme of producer levy was introduced again during the crop year 1973-74. The scheme has continued in a revised form since then.

The scheme, when originally introduced in 1965-66, was intended not as an alternative to levy on rice millers, but only as a supplementary measure aimed at preventing smuggling of paddy to adjoining districts. From the year 1973-74 onwards, the levy on producers came to be recognised as an important alternative method of procurement. Rice procured from the levy on producers, absolutely as well as a per cent of total procurement, increased during the period 1973-74 to 1975-76 (see Table 1).

We have estimated the procurable surplus of paddy for each district of Andhra Pradesh corresponding to the producer levy slabs announced for the year 1974-75, adopting the following method (see Table 2 for levy slabs). The Agricultural Census for Andhra Pradesh gives details of the size distribution of holdings according to cropping pattern. From this source, we have obtained the area irrigated by canals, and the area irrigated by other sources. We have obtained the Kharif and Rabi area devoted to paddy for different districts from the Civil Supplies Commissioner, Andhra Pradesh. Unfortunately, these data are not available according to size class of holdings. We have, therefore, assumed the proportion of paddy area devoted to Rabi to be invariant as between different size-class of holdings, *within* a district. Another limitation of *this method is that the data on area* devoted to paddy according to size-class of holdings relate to the year 1970-71, which we are using for estimating procurable surplus for 1974-75, in the absence of such data for later years. Having obtained the Kharif and Rabi area devoted to paddy according to size-class of holdings, and according to source of irrigation, we have used the slabs notified by the government to derive the procurable surplus for each district. The estimate for 1974-75 may be expected to hold good for 1975-76 as well as we find that there is only a marginal change in the levy slabs, at the lower end of the size-class of holdings, which may not affect the overall magnitude of the procurable quantum substantially.

Although farmers were expected to surrender levy paddy from the output of Kharif as well as Rabi seasons, we have estimated the procurable surplus on the basis of two assumptions:

Assumption I: Levy is imposed only during the Kharif season.

Assumption II: Levy is imposed during the Kharif season and also during the Rabi season only on the area irrigated through major sources.

These details are given in Table 3. For the state as a whole, procurable surplus as proportion of output works out to roughly 40 per cent.[1] The five coastal districts account for nearly 45 per cent of the state's total procurable surplus. Interestingly, even the chronic deficit districts such as Visakhapatnam and Srikakulam contribute approximately 1 lakh tonnes each, primarily because of the large number of medium-sized holdings in these districts. Fourteen districts comprising Rayalaseema and Telangana regions account for only 40-45 per cent of procurable surplus of the state. Despite these inter-regional differences in the relative share in the state's procurable surplus, there is no significant variation in the procurable surplus as a proportion of output, as between different regions or even districts (see columns 5 and 6, Table 3). The levy-wise break-up of the quantity actually procured is available for the state as a whole and also eight important districts. We have estimated the degree of evasion for these eight districts which account for 50 per cent of the state's procurable potential (through producer levy) and actual procurement through producer and miller levies. The degree of evasion of producer levy for the state as whole works out to 75 per cent, whereas for the two important coastal surplus districts, *viz,* East and West Godavari, about 60 per cent (see Table 4). The degree of evasion, in general, appears to be greater among Rayalaseema and Telangana districts than in coastal districts.[2] Further, while the procurable surplus through producer levy alone works out 40 per cent of output, the quantity actually procured through producer *and* miller levies together amounted only 22 per cent of output.

It would be interesting to conjecture on the probable quantum of procurement in a bad year. Analysis of the data on

production and procurement of rice for Andhra Pradesh state as a whole for the period 1967-68 to 1975-76 reveals that a major shortfall in production of over 20 per cent occurred only once, i e, 1968-69 Kharif (see Table 1). Interestingly, even in that bad year, procurement as a proportion of output was 10 per cent, whereas this proportion was somewhat lower in better years Presumably this may be due to the fact that the demand for foodgrains from the public distribution system increases forcing the government to procure (irrationally) in bad years.[3] District-wise analysis of rice production further indicates that whenever minor shortfalls in state's production occurred, only 4-5 out of the 21 districts were affected. Moreover, of the coastal district which account for 60 per cent of state's rice production, not more than one district experienced a decline in production in any given year. Thus on the basis of past experience, it may be inferred that the procurement through producer levy may have to be abandoned in a bad year in one of the major rice-surplus coastal districts and in three or four of the remaining districts in the state. On this basis, the shortfall in procurement through producer levy (realisable potential) in a bad year may be about 4.5 lakh tonnes or about 20 per cent of the realisable potential in a normal year.[4]

As can be seen from Table 1, procurement through levies on both producers and rice millers together accounted for about 22 per cent of output during the year 1975-76. Experience with producer levy indicates that despite prevalence of widespred evasion, it has graduall become an important instrument in the state (see Table 1) owing to improvement in implementation of the scheme. Nevertheless, it appears desirable , to place reliance on levies on producers as well as rice millers until the former source becomes dependable when levies on rice millers can be dispensed with.[5]

II

Producer Levy and Income Loss

One of the issues discussed in the foodgrains price policy debate is whether government procurement at a price below the open market price would result in an income loss to the farmers, in which case levies may sap incentives to produce foodgrains. Whenever there is procurement by the government, open market price may be expected to go up.[6] As such, it is reasonable to believe that in the absence of levies, open market prices would have been lower than at present for two reasons. Firstly, the government is entering the market as a buyer, so that, there is a reduction in the quantity available in the market for other purchasers (millers, co-operatives, etc). Secondly, levy takes a certain portion of the supply, and gives it to the lower income consumers with the more price-elastic demand. The free market is then left to those persons with higher incomes with inelastic demand. The effect then is to concentrate the shortage among the consumers with the inelastic demand. The higher the allocation to the poor, the greater will be this effect.[7] Levy purchases could thus push up open market prices of paddy/rice. If the weighted average price for the total sales (to the government and in the open market) is not less than the price he would have realised in the absence of levies, the farmer would not incur any income loss.

We shall investigate whether procurement at a price lower than open market price did or did not result in income loss for the three recent years, i e, 1973-74 to 1975-76, for farmers in in the rice-surplus coastal districts of Andhra Pradesh where procurement through producer levy was intensified during these years. The behaviour of levy and open market prices of paddy and rice in rice-surplus (procurement) district of Andhra Pradesh are given in Table 5.

The marketed surplus as a proportion of output may be expected to differ significantly as between coastal districts and the remaining districts of the state. In a field investigation of the West Godavari district, the author found that the marketed surplus of holdings above 5 acres averaged 60 per cent of output during Kharif of 1968-69[8] Since virtually the whole of the Rabi output is marketed in these districts, the marketed surplus as a proportion of total output (Kharif + Rabi) may be expected to be even higher especially during the year 1970-75, when rabi paddy output grew rapidly in this region.[9]

We now need an estimate of the proportion of levy sales to total sales.

Andhra Pradesh	19.741	23.182	57.003	34.6	40.7

Producer levy averaged 5, 8, and 9.2 per cent of output (see column 6, Table 1) or 10, 16 and 18.4 per cent of marketed surplus, assuming the latter to be 50 per cent of output, for the three years 1973-74 to 1975-76 respectively. If the proportion of marketed surplus to output is greater than 50 per cent, as we suspect it to be, then the producer levy as a per cent of marketed surplus would be even lower than the above mentioned percentages. However, we computed the weighted average price PW, assuming levy sales to be 10, 20 and 25 per cent of marketed surplus, which could have been the maximum percentages for the year 1973-74, 1974-75 and 1975-76 respectively.[10] We hypothesise that

$$P0 \leq PW$$

where P0 is the open market price in the absence of levies, in which case farmers are compensated for lower procurement prices.

We shall examine whether the responsiveness of market price, $\frac{(P_2 - P_0)}{P_0}$ or $\frac{(P_2 - PW)}{PW}$ when $P0 = PW$, to the quantity cornered by the government levy quantity as a proportion of rice output in the districts is reasonable enough on *a priori* grounds, to conclude that farmers are compensated.[11]

We have two estimates of price flexibility co-efficients for rice in India. In a study on the determinants of rice prices, Thamarajakshi estimated the price flexibility co-efficient to be (—) 1.10.[12] The per cent change in price of rice as a result of a one per cent change in output of rice may be expected to be high because the price elasticity of demand for rice is much below unity in India. N S Iyengar and L R Jain estimated the income elasticity of demand for rice for rural and urban areas to be 0.54 and 0.13 respectively.[13] Ignoring the cross price elasticities of demand for rice with response to prices other than those of rice, the price elasticity of demand for rice can be expected to be of the same low magnitude (with a negative sign)[14] i e, about (—)0.5. This gives a price flexibility co-efficient of (—)2.0. Thus, from the available estimates, we may expect the price flexibility co-efficient for rice to lie in range of (—)1.10 to (—)2.0.

We have worked out the price flexibility co-efficients implied in the price rise needed to compensate for lower procurement (levy) prices during the year 1973-74 to 1975-76 (see Table 6). We have indicated in the Table the relevant weights, and the percentage change in quantity of output withdrawn through levies for different years.

Since, the range of the price flexibility co-efficient needed to compensate for low procurement price is between (—)0.13 and (—)0.31 during the years 1973-74 to 1975-76, which is considerably lower than the actual range of the price flexibility co-efficient mentioned above, i e, (—)1.10 to (—)2.0, it seems reasonable to conclude that farmers were compensated for the lower procurement price through a rise in the open market price.[15]

We now contrast the above situation with what would have been the impact on income if the procurable surplus estimated in section I were actually realised from farmers. In this case, the proportion of levy paddy surrendered by farmers would be considerably higher than at present. We assume the proportion of levy sales to approximate to 50 per cent of the marketed surplus (of both crops), which could be the maximum in any year. The government would then have produced an *additional* 20 per cent of output during 1973-74 and 1974-75 or 25 per cent of current non-levy output. In view of the already high level of procurement, the additional quantity procured would be smaller for 1975-76 (ie, 10 per cent of output, or 14.3 per cent of non-levy output). It is interesting to examine whether the open market price of rice would have been risen in this situation such that farmers are compensated for lower price.

Assuming that farmers are just compensated, we shall examine how much the free market would have to rise if procurable surplus according levy slabs were realised, i e, the farmers received the same weighted price as at present. In this situation, the weights for levy and non-levy sales would be equal (i e, 0.50 for each). Therefore, 0.50PL +

Sources. For columns 2 to 5, State Civil Supplies Department.
For column 6, 1969-70 adapted from M Khan and Tripathy, Intensive Agriculture and Modern Inputs; 1971-72, A PC Report of Kharif Cereals; 1975-76, projected on the basis of increase in the purchased inputs.

0 50 PH = PW, where PL is the levy price, and PH is the open market price (hypothetical) which would compensate for lower levy price when producer levy is strictly implemented, and PW is the weighted price at present. The price flexibility co-efficients required to compensate for lower procurement price if the procurable surplus were realised in full, work out to (—)0.82, (—)0.69 and (—)0.37 respectively for the three years, 1973-74 to 1975-76. These are still much lower than estimated price flexibility co-efficients for rice in India mentioned earlier. If the farmers are already over-compensated, the implied price responsiveness would be even lower.[16]

The conclusion that emerges from the foregoing analysis is that there does not appear to be any income loss to the farmers in the coastal Andhra region on account of procurement at prices lower than the open market price during the three recent years (1973-74 to 1975-76) which witnessed increasing reliance on producer levies.[17]

III

Procurement Price and Cost of Production

For determining whether producer levy constituted a disincentive to the farmers, we have also to consider (i) whether the levy price, though lower than open market price, is at least high enough to cover the costs of production, and (ii) whether the weighted price received by farmers covered the cost of production leaving a reasonable profit margin.

We do not have estimates of cost of production of paddy for recent years. We made use of the available estimates of cost of production including that of Agricultural Prices Commission for the years 1969-70 and 1971-72. We projected the APC's 1971-72 estimate, on the basis of the increase in the prices of purchased inputs, for the year 1975-76. These along with levy price, open market prices, are given in Table 5. These data reveal that for rice, the procurement price and possibly even the weighted price, did not cover the cost of production for earlier years. This might have been the primary motivation for evasion in the earlier years and consequently for the total collapse of the producer levy scheme. However, the procurement price did cover the cost of production excluding the imputed value of human labour even for the earlier years. The gap between the two narrowed by 1975-76. The procurement price of paddy was considerably lower than the market price throughout the period, although the increase in the former was proportional to the increase in the latter. This is in sharp contrast with wheat for which the procurement price was nearly always as high as the open market price and covered the cost of production throughout the period (see Table 7).

IV

Conclusions and Policy Implications

The procurable potential of rice (through producer levy) works out to 40 per cent of output, whereas the actual procurement through levies on producers and rice millers together ranged between 15 and 20 per cent of output during 1973-74 to 1975-76 in Andhra Pradesh. The results show the degree of evasion of producer levy in the rice-surplus coastal districts to be about 60 per cent. Despite evasion, producer levy did become an important instrument of procurement in the state in recent years owing to general improvement in implementation as well as more realistic fixation of levy prices.

In the coastal districts of Andhra Pradesh where procurement through producer levy gained in importance, our results show that there does not appear to be any income loss to the farmer, on account of procurement at prices lower than the open market prices during the three recent years, 1973-74 to 1975-76. Our results further indicate that even if the levies were realised in full according to statutory slabs farmers would still not suffer any income loss on their total marketable surplus since free market prices may be expected to go up steeply. Besides, the producer levy may have some

TABLE 6: COMPUTED LEVELS OF PRICE FLEXIBILITY CO-EFFICIENTS IF FARMERS ARE TO BE COMPENSATED FOR LOW PROCUREMENT PRICES IN COASTAL ANDHRA PRADESH 1973-74—1975-76

Notes · Figures in row (1) are obtained from table 5 col. 3. The starred figures in Row 5 relate to *actual* proportions of output withdrawn through levies (see Table 1). The underlined values of PFCs are computed with these starred figures in the numerator. However, we have also computed the PFCs assuming the proportions to be 20, 20 and 30 for the year 1973-74, 1974-75 and 1975-76 respectively, which could have been the maximum, given the prevailing reluctance of the levy enforcement machinery. These are given below the underlined figures.

TABLE 7: OPEN MARKET LEVY PRICE AND THE COST OF PRODUCTION OF WHEAT (Punjab)

Year	Wheat Procurement Price	Wheat Market Price	Cost of Production
(1)	(2)	(3)	(4)
1967-68	76 00	80.40	—
1968-69	76.00	81.33	—
1969-70	76 00	91 80	—
1970-71	76 00	89.00	—

favourable income redistribution effect in so far as small farmers are free to sell their entire marketable surplus at (higher) free market prices. As producer levy gains in importance, levies on rice millers may be scaled down, since correspondingly less paddy will be available for transactions on private account. Moreover, since rice millers tend to shift the lower procurement price backward, it might have a stronger impact on small farmers whose bargaining power is lower than on medium and large farmers.

At present, producer levy slabs graded according to size class of holdings, differ as between irrigated and unirrigated area under paddy. The prevailing levy slabs are very low in the case of large-sized holdings. Experience with the producer levy scheme in Andhra Pradesh suggests that it is desirable to totally exempt holdings upto 2.5 and 5.0 acres for irrigated and unirrigated holdings respectively, increase the slab rates for holdings above 10 acres (irrigated) and 15 acres (unirrigated), so that administrative effort is concentrated on a fewer number of medium and large farmers. Field Studies on the operation of levies indicate that evasion can be checked if two policy changes are introduced: (a) under-reporting of area under paddy can be checked if levy is extended to *all* cultivating holdings above a particular size in the paddy zone whether growing paddy or not; (b) the functions of requisitioning of levy paddy (now performed by state government officials) and actual purchasing of paddy (performed by Food Corporation of India) should be combined and a single organisation should be entrusted with these responsibilities for better administration of levies Given the political will it is thus possible to check evasion in which case producer levy can emerge as an effective instrument of public procurement.

Notes

[This is a part of wider study on some aspects of marketing, public procurement, and distribution of rice in Andhra Pradesh, sponsored and supported by the Indian Council of Social Science Research. I am grateful to C H Hanumantha Rao and S D Tendulkar for helpful suggestions. Y Narayana Rao rendered competent research assistance. I alone am responsible for any errors.]

1 The legally imposed levy slabs do not make allowance for differences in yield per hectare across different size class of holdings. We do not consider this as a serious limitation in view of the fact that in the irrigated coastal districts of Andhra Pradesh, we do not expect yield levels to vary on between different size class of holdings. Yields may vary between irrigated and unirrigated areas, but this has been taken care of in as much as levy slabs are lower for the latter.

2 Since the evasion for the state as a whole is 75 per cent and for the coastal districts (for which we have district-wise data) it is 60 per cent, the evasion for the residual component, Rayalaseema and Telangana regions, should be much higher. Further, in a study based on field investigation, the author found the degree of evasion, averaged for all size class of holdings, to be 64.7 per cent in the West Godavari District, for the year 1968-69 Kharif. See, K Subbarao, "Rice Marketing System and Compulsory Levies in Andhra Pradesh" (Allied Publishers, Delhi, 1978).

3 See, Raj Krishna and G S Rai Chaudhari, "Some Aspects of Rice Price Policy in India" (mimeographed, Delhi School of Economics, 1978).

4 We are assuming that a bad year is one when a shortfall in output of about 20 per cent occurs. For obvious reasons we are ignoring years of national calamities such as the recent cyclone in Andhra Pradesh, when all levies will have to be given up.

5 We have examined the issue of inter-district ban on movement of rice for purposes of procurement elsewhere. Our results indicate that such restrictions did not help in procurement in the past (See K Subbarao, "Rice Price Behaviour and Public Procurement An Analysis of the experience of Andhra Pradesh", *Indian Journal of Agricultural Economics* July-Sept 1978

6 See, M L Dantwala, "Incentives and Disincentives in Indian Agriculture", *Indian Journal of Agricultural Economics*, April-June 1967. Also see his recent review of Agricultural Policies in *Indian Journal of Agricultural Economics*, October-December 1978

7 See J W Mellor, "Functions of Agricultural Prices in Agricultural Development", *Indian Journal of Agricultural Economics*, January-

March 1968. See also his paper "Agricultural Price Policy and Income Distribution in Low Income Countries", World Bank Staff Working Paper No 214, World Bank September, 1975.

8 See "Rice Marketing System and Compulsory Levels in Andhra Pradesh", *op cit.*

9 The compound rates of growth of total output, Kharif output and Rabi output of rice during the period 1966-67 to 1975-76 for Andhra Pradesh are 3.1, 4.6 and 6.5 respectively.

10 By assuming probable percentage of levy sales to marketed output, we are on the conservative side since this amounts to farmers receiving the lowest probable weighted price.

11 The price responsiveness is given by $\frac{P_1 - P_0}{P_0} \Big/ \frac{Q_0 - Q_1}{Q_0}$ where P_1 is the free market price after levies are imposed; Po is the free market price (hypothetical) that would have obtained in the absence of levies, Qo is the quantity of output in the absence of levies; and Q1 is the quantity of output after a part of output is withdrawn by the levies. Assuming $P_0 = PW$, ie, farmers are compensated, the implied price responsiveness is obtained by $\frac{P_1 - PW}{PW} \Big/ \frac{Q_0 - Q_1}{Q_1}$ where PW, the actual weighted price, is substituted for P_0. This responsiveness is somewhat analogous to the price flexibility co-efficient. Strictly speaking, price flexibility co-efficients for rice are not comparable to the re-responsiveness derived by us. For, a price flexibility co-efficient indicates the price response to *actual* declines (or increases) in output. This is not exactly similar to our case, because although output is withdrawn by the government from the coastal districts, it is eventually released elsewhere in the country through the fair price shops. For these districts, however, levies would mean a decline in the quantity available to the private marketing agencies.

12 R Thamarajakshi, "Determinants of Rice Prices", *Agricultural Situation in India*, March 1970.

13 N S Iyengar and L R Jain, "Projection of Consumption, Rural/Urban 1970-71 and 1975-76", *Economic and Political Weekly*, November 29, 1969. Based on the 16th Round of N S S, D Coondoo (ISI, Calcutta) calculated the expenditure elasticity for rice for rural Andhra Pradesh to be 0.6633. (I owe this reference to S Tendulkar.)

14 This follows from the Slutsky-Schultz theorem. According to this theorem, the algebraic sum of income, price and cross elasticities of demand for any commodity equals zero. Homogeneity of demand functions of degree zero in all prices and incomes implies $\Sigma\, e_{is} = - E_i$, where $e_{is} = \frac{p_s}{x_i} \cdot \frac{\partial x_i}{\partial p_s}$ and $- E_i = e_{i1} + e_{i2} + \ldots\ldots e_{in}$. For foodgrains as a whole, is reasonable to assume eis for $S \neq i$ to be negligible. However, in rural Andhra Pradesh, rice happens to be the dominant foodgrain, accounting for 73 per cent of expenditure on foodgrains and 68 per cent of quantity of foodgrains consumed. See NSS Table with notes on consumer Expenditure, Seventeenth Round, September 1961 July 1962, Number 184, pp 239 and 333. It appears reasonable, therefore, to assume the cross price elasticity of demand for rice to be negligible in Andhra Pradesh.

15 It must be remembered that 1974-75 was an exceptional year which witnessed unprecedented price rise, while paddy prices slumped in the following year, ie, 1975-76.

16 If one knows the exact magnitude of price flexibility co-efficient, one can work out levy proportions and levy prices that are consistent with the incomes that the farmers would receive in a free market situation.

17 Strictly speaking, this conclusion is valid only in the aggregate, ie, for all cultivators in all coastal districts as a whole. This still does not rule out the possibility that individual farmers may not have sustained income loss depending upon the open market prices they received and the percentage of output marketed to the government, given the levy price. However, in an earlier field investigation we found the proportion of levy sales to total sales to be the same for small medium and large farmers despite the existence of progression in statutorily fixed levy sales. See K Subbarao, "Rice Marketing System and Compulsory Levies in Andhra Pradesh", Allied Publishers, 1978. Further, assuming variation in prices received by different farmers to be negligible at harvest time when levy paddy is surrendered, our conclusion regarding absence of income loss in the aggregate may still be valid at the individual farmer level as well.

18 See K Subbarao, "Rice Marketing System and Compulsory Levies in Andhra Pradesh", *op cit.*

Cross-Breeding of Indian Cattle : An Evaluation

A R Rajapurohit

The programme of cross-breeding of Indian cattle with a view to improving the breed and increasing the milk yield began sporadically under British rule and has been more systematically pursued in the years since Independence. This article attempts to evaluate this programme.

It begins with a general discussion of the bovine economy in India and the many conflicting issues involved in its development, particularly the differing needs that influence the raising of draught animals and milch animals, of indigenous cattle and cross-bred cattle, and of cows and bullocks as against buffaloes. It goes on to describe various cross-breeding programmes that are being implemented in different pockets in the country and presents three specific case studies of areas where the cross-breeding programme is supposed to have been successfully implemented. According to the author, the economic impact of the cross-breeding programme has to be judged by setting the gains made in milk production against the setbacks and losses incurred in draught power availability.

I

Introduction

BOVINES in India are kept for the dual purpose of draught power and milk. There is a lot of specialisation in these two functions, namely, the cattle among the bovines being mainly kept for draught power and the buffaloes being kept for milk. Both cattle and buffaloes mainly live on dry fodders derived from straws of cereals and millets and from plant residues of legumes; and green fodder from fodder crops, grasses from forest land, pastures, permanent fallows and cultivable waste. The milch and the working animals are sometimes fed with inferior pulses like horsegram and various oil cakes as major sources of protein. Thus the bovines in India mainly live on the by-products of grain and pulse crops which are not used for direct human consumption and serve the dual purpose of draught power supply for crop production and allied activities and milk for human consumption. It should be noted that they are rarely kept for beef. It is only in some hilly areas like Nagaland and the Nilgiris (and also in Kerala) where beef eating population is predominant that the bovines are also kept for beef. The fodder constraint leads to contradiction in the development programmes for draught and milch animals, the former depending upon the demand for draught animal power and the latter on that for milk.

Most of the cattle breeds in India are draught breeds [38, 51]. The milk yield of these draught breeds is as low as half a litre to 1½ litre per day per milch cow. With an increase in human population and also the impact of urbanisation and increased economic prosperity, the demand for milk, at least in certain urban pockets, has been increasing rapidly. As the milk yield of the cows in India is extremely low, it is not possible to meet the additional demand for milk by milch cows. It was therefore necessary to introduce some high-yielding milch animals in the Indian dairy economy which has been achieved by the very high rate of increase in the population of milch buffaloes. It is not surprising that many livestock experts maintain that in India it is the buffaloes which are the milch animals and the cows are maintained not for producing milk but for breeding quality draught animals for agricultural operations.

There was however a move by some dairy experts to increase the milk yield of the Indian cows by cross breeding. The idea was mooted in the earlier part of the century but was however, not supported by other dairy experts. Probably, the reason for rejecting the move to cross-breed the Indian cows with exotic breeds like Jersey, Red Dane, Holstein and Brown Swiss, etc, was the fear that the exotic breeds would not be acclimatised to Indian conditions resulting in heavy mortality of the cross-bred progeny. The other reason, which not explicitly mentioned, was that a male breed of the cross-bred was not, physically or economically as efficient as the quality indigenous draught breeds [3, 15, 18].

During recent years, however a large scale programme propagating the cross-bred cattle under the Indian conditions has been undertaken in a rigorous way in certain restricted pockets. As the implementation of this programme is uneven in different parts of the country and also as the impact of this programme on the bovine economy of the country varies from place to place, it is rather early to evaluate the success of this programme. It is however, important to point out some of its possible impact on the basis of available information.

The programme can be evaluated at two stages; (1) the stage of the propagation of the cross-bred cattle, and (2) the stage when the economic impact of the scheme could be measured. The first stage evaluation has two issues. The first is that of the problem of extension of the cattle-breeding programme which depends upon the number of cows in the fecundity age group within the region of service centre, efficient use of exotic semen and the technical personnel who handle it and also the efficiency of the 'contact' agency which persuades the cow owners to get their cows inseminated with the exotic semen. Secondly, the cross-bred progeny is likely to be highly susceptible to some diseases which may result in high morbidity and mortality rates. Certain hygenic and medical precautions are warranted in the initial stages itself. It would be appropriate to evaluate the efficiency of the organisational set-up which undertakes such precautionary measures.

In the second stage, the economic impact of the scheme would be measured in two respects. First, the relative milk yield and the input use of the cross-bred cows as compared with the indigenous milch animals, particularly, the buffaloes, would be assessed. Secondly the relative draught power and the input use of the cross-bred bullock as compared with the indigenous one would be evaluated.

TABLE 1: DETERMINANTS OF BOVINE DENSITY

States	Bovine Density (Per 1,000 Hectares)	Proportion of Small Holders (in percentage)			Proportion of Irrigated Area Per Cent	Major Crops
		Upto 0.5 Hectares	Upto 1.0 Hectares	Upto 2.0 Hectares		
	1	2	3	4	5	6
Andhra Pradesh	1,440	28.41	46.19	65.83	21.75	Rice and millets
Assam	2,200	33.19	57.03	80.78	19.84	Rice
Bihar	1,619	46.54	64.32	78.95	19.84	Rice
Gujarat	992	11.67	23.77	42.85	14.53	Millets
Haryana	1,442	14.45	27.36	46.26	47.33	Wheat
Himachal Pradesh	4,465	39.05	58.20	78.45	15.59	Wheat and rice
Jammu and Kashmir	2,782	49.37	72.81	88.59	31.42	Rice
Karnataka	1,181	14.84	30.44	54.08	10.08	Millets and rice
Kerala	2,089	65.60	81.56	93.17	28.00	Rice
Madhya Pradesh	1,522	19.32	31.75	48.55	8.01	Millets and wheat
Maharashtra	850	13.80	26.08	42.82	6.02	Millets
Manipur	3,747	11.51	40.87	83.74	70.39	Rice

II

Milch vs Draught Animals

According to the livestock census 1972, the total cattle and buffalo populations in the country were about 178.86 and 57.94 millions respectively. In 1951, there were about 155.29 million cattle and 43.40 million buffaloes. Thus, if an overall picture is taken, it will be seen that the populations of cattle and buffaloes have increased during these 22 years by 15.10 per cent and 33.50 per cent respectively. During the same period however, human population in India has increased by 51.69 per cent. The higher rate of increase in the population of the buffaloes could be probably due to the overall increase in the human population effecting higher level demand for milk. Moreover, during the same period, the proportion of the population staying in the urban areas with higher incomes has also increased drastically, resulting in increased demand for milk. This additional demand was probably met by milk from the buffaloes which are really the milch animals in India. It could be also seen that the increase in the cattle population commensurates with the increase in the cultivated area.

Animal husbandry experts usually group Zebu cattle of India and Pakistan into 5 orders: (1) Deep bodied powerful draught animals which include Kankrej, Malvi and Tharparkar; (2) Short horned cattle with light or grey body, including Gaolo, Hariana Krishna Valley, Nagore, Ongole and Rath; (3) Heavy animals with pendulous dewlaps and sheaths which include Deoni, Gir, Red Sindhi and Sahiwal (4) Cattle with prominent foreheads and long pointed horns popularly known as the Mysore cattle, the breeds under this group are Amritmahal

Hallikar and Kangayam; and (5) Danni breed which is similar to the Afghan cattle now found in Pakistan.

All these breeds except Sahiwal, Red Sindhi, Tharparkar, Kankrej and Gir are draught breeds giving very low yield of milk. Most of the quality draught breeds mentioned under the five groups above are already crossed with the non-descript breeds in the country since the cattle development programmes were introduced during the British period. It is thus very difficult to trace any pure breed of either the draught or the milch cattle in India [47].

Most of the draught breeds in India are fed with dry fodder and crop residues and occasionally the locally available concentrates. The cost of maintenance of the draught breed varies from farmer to farmer depending upon the availability of the fodder resources. In the case of milch breeds like Sahiwal, Red Sindhi, etc, the fodder requirements are again met through the local resources like dry fodder and crop residues and also locally available concentrates. That is so in the case of the buffaloes which are kept for milch purpose. Thus one would find that the area devoted for fodder grasses is extremely low in many parts of India.

The density of bovines (including both cattle and buffaloes) measured in terms of number of bovines per thousand hectares of operated area indicates the following:

(1) Bovine density depends upon the proportion of small cultivators to the total number of cultivators; the higher the proportion of small holders the larger is the density.

(2) Bovine density depends upon cropping pattern in the area. Certain crops like paddy require more animal power than certain other crops like wheat or millets. In those areas where paddy is the major crop one would find a very high density of the bovines.

(3) Bovine density may also depend upon human population density. The higher the human population, the demand for milk may increase and it may result in keeping up of more bovine population. Probably urbanisation resulting in higher income levels of the population may accelerate the demand for milk which may cause higher bovine density.

(4) There may be some socio-cultural factors which may influence the higher rate of consumption of milk and milk products. This may cause the higher bovine density.

(5) Bovine density may also depend upon the proportion of the irrigated area. Under the irrigated conditions it is possible to grow more than one crop during the course of the year, which may give continuous supply of both green and dry fodders throughout the year. The fodder availability may be one of the major factors influencing bovine density. Similarly in those areas where plenty of forest land is available and also where there are facilities for common grazing of the cattle, the density of bovines may be quite high.

In India, bovine density varies from [illegible] in Rajasthan to 4,405 in Himachal Pradesh. In the millet growing states like Gujarat, Maharashtra, Karnataka and Rajasthan, the density appears to be around 900. In the major wheat growing areas like Punjab, Haryana, Uttar Pradesh and Madhya Pradesh, the density is around 1,500. In the rice growing regions like Tamil Nadu, Kerala, West Bengal, Orissa and Coastal Andhra Pradesh, the density appears to be around 2000 (Table I).

The fact that the cattle are kept for draught purpose and buffaloes are kept for milk purpose, is revealed by the sex ratios of cattle and buffaloes. As the cattle are kept for draught purpose the tendency is to prefer the males to the females. There are, however instances of using cows for draught purposes in some restricted pockets of India but this practice is extremely on an insignificant scale [31]. In the case of buffaloes very rarely are males used for draught purpose, and is believed that they are starved to death before reaching the age of three. They are not properly fed and their health conditions are uncared for. In the case of female cattle, the non-adults are not properly looked after. This preferential tendency of taking proper care of the males among the cattle and females among the buffaloes has resulted in a sort of imbalance in the sex ratios of both cattle and buffaloes, when they reach the adult stage.

The sex ratio defined as number of females divided by the number of males should be unity under the normal circumstances. In the case of the cattle, however, the sex ratio is less than unity in major parts of India (Table 2); it is 0.7607 at All-India Level and varies from 0.4930 in the case of Uttar Pradesh to 3.3163 in the case of Kerala. It may be noted that it is only in a few states like Jammu and Kashmir, Kerala, Meghalaya, Nagaland and Rajasthan, that the sex ratio of the adult cattle is more than unity. Probably in those areas the cattle are maintained for beef. In such cases male cattle, when they reach adulthood are usually sent to the butcher — a practice which is quite prevalent in Kerala and also in the tribal areas of the northeast. In Jammu and Kashmir too probably the same

TABLE 5: WORK CAPACITY OF CROSS-BRED AND HARYANA BULLOCKS

(Average of 3 pairs in each group)

Breed	Season	Pulse Rate/mt Four Hours of Continuous Work			Respiration Rate/mt Four Hours of Continuous Work			Area Ploughed in 6 Hours sq mts

reason may hold true. In Rajasthan, however, the sex ratio is high for other reasons — like availability of plenty of grazing land facilitating large scale cattle-breeding. The male cattle, when they reach adulthood, are exported to the neighbouring states for draught purpose. In other important agricultural regions of India, the sex ratio is always less than unity and in many cases it is around 0.8. In the Gangetic plains and in Gujarat the ratio is around 0.5 whereas in the Punjab and Haryana regions it is about 0.7. In the Southern plateau consisting of Andhra Pradesh, Maharashtra, Karnataka and Tamil Nadu, the sex ratio varies from 0.7 to 0.9. It should be noted that there are many quality draught breeds in these areas and for the development of which a number of cows maintained appears to be quite high resulting in high sex ratio. In Orissa, West Bengal and Assam, the sex ratio is around 0.9 which could be due to the reason that the cattle there are of inferior quality and are maintained by small holders with limited fodder resources for both milk and draught purposes.

When we come to the sex ratios among the buffaloes we find that in majority of the cases they are more than unity. The ratio is 3.6413 at all-India Level and varies from 0.3950 in West Bengal to 47.6046 in Gujarat. The ratios are very high in Gujarat (47.6046) Haryana (20.6935) Himachal Pradesh (25.8571) Karnataka (36.9800) Maharashtra (6.0746) Punjab (7.7232) and Rajasthan (17.0684). Probably, in these areas there is no scope for putting the adult male buffaloes for any economic use. Naturally the tendency is to make the male buffalo calves starve to death by neglecting their feeds and also following certain practices which will result in the death of the male buffalo calves. In states like Andhra Pradesh, Assam, Bihar, Manipur, Meghalaya, Nagaland, Tamil Nadu and Uttar Pradesh, the ratios are more than unity but are not very high. Probably, in these areas the male buffaloes are put to some economic use. There are however, the states like Jammu and Kashmir, Kerala, Orissa and West Bengal where the sex ratios are less than unity. In these areas where monsoon paddy is an important crop, the male buffaloes are used for draught purpose in the paddy fields. It is believed that the buffaloes work with equal or more efficiency in the monsoon paddy fields along with the cattle.

Though the cattle are kept for draught purpose and the buffaloes for milk purpose, in both the cases, generally they are used for both purposes. As the male cattle are more efficient than the male buffaloes the tendency is to maintain the male cattle for draught purpose on a large scale. On the other hand, as the female buffaloes are better milk yielders than female cattle, the tendency should be to keep more female buffaloes than female cattle. This is however not possible because certain number of males as well as females among both cattle and buffaloes are to be kept for breeding purposes. When we work out the buffalo-cattle ratios separately for adult males and adult females, certain facts will become clear to us. Adult male ratios are extremely small in many parts of the country suggesting that it is the bullock and not the male buffalo which is the draught animal under Indian agricultural conditions. The adult male ratio of buffalo-cattle is 0.1087 at all-India level. It varies from 0.0128 in Karnataka to 0.5765 in Kerala. The ratios are extremely small in those areas where the male buffalo cannot be put to any economic use. Such areas are Bihar, Gujarat, Haryana, Himachal Pradesh, Karnataka, Maharashtra, Meghalaya, Rajasthan, Tamil Nadu and Tripura. There are however, certain areas where the male buffaloes are put to important economic uses. In such cases the ratios are quite high. The areas where male buffaloes are put to economic uses appear to be Andhra Pradesh, Assam, Jammu and Kashmir, Kerala, Madhya Pradesh, Manipur, Nagaland, Orissa, Punjab, Uttar Pradesh and West Bengal.

The male buffaloes which survive and reach the adult stage may not exactly be always used for draught power in agriculture. It is possible that in some areas they are used for beef. However, it is not possible to know exactly for what purpose the male buffaloes are maintained on large scale in some areas.

The buffalo-cattle ratio for adult females suggests the importance of buffalo as milch animal in different areas in the country. The ratio is more than unity only in three states and is more than 0.5 in seven states. This reveals that the maintenance of female buffaloes for milk purpose does not only depend upon the demand for milk in the area but also upon the availability of fodder resources in the area. The ratio is 0.5205 at all-India level which roughly suggests that nearly 65 per cent of the milk produced in India comes from buffaloes as the buffalo yields more than two times that of a cow. In states like Gujarat, Haryana and Punjab where the fodder resources are available in plenty the ratios are more than unity. In such cases it is the buffalo which is the major milch animal and not the cow. There are however, some intermediary areas where buffaloes as milch animals have gained lot of economic importance. Such areas are Andhra Pradesh, Himachal Pradesh, Rajasthan and Uttar Pradesh. In other areas buffalo-cattle ratios for adult females are quite low because of the

resource constraint in respect of fodder. Moreover most of these areas are traditional cattle breeding centres where cattle are maintained on large scale. Though the milk yield of the cows is extremely low, as the number of cows is large, the total quantity of milk available appears to be sufficient to meet the demand for milk.

There can be no controversy regarding the scarcity of fodder resources to maintain the size of bovine population in India, which is supposed to be *surplus [7, 8, 11, 23]. Several* studies have already been made which have proved that the availability of the fodder resources is far less than the requirement [1, 2, 14, 32]. As fodder is a resource which is a by-product of the cereal crops, its availability is based upon the area devoted for the cereal crops and also its production. Land being the limiting factor in Indian economy, there is no further scope for expanding the area to be dovoted exclusively for fodder crops. So, the available fodder resource is to be shared by the milch and draught animals on the basis of their relative needs, more so on the basis of the farmers' preference for allotting a particular share to a particular category of the animal. The scarcity of fodder resource thus brings in the problem of contradiction in the development programmes for draught and milch animals.

So long as (a) no additional land would be available for growing fodder crops and the bovines would mainly live on straws of grain crops and residues of pulses, and (b) agriculture would continue to depend upon the draught animal power, there is little chance of increasing milk yield in the country by mere addition of number of milch animals, even of quality milk breeds. It is rather difficult to imagine any significant reduction in the bovine population in the country without major technological and institutional changes in agriculture [17, 30]. There is a vicious circle of low feed levels leading to low milk yields necessitating the keeping of more animals leading to low feed levels. This vicious circle appears to be operating in the case of draught animals also. The higher the density of the draught animal, the weaker is the breed [33].

III

Cross-Breeding Work

When exactly bulls of exotic breeds were used for crossing with indigenous cows in India is not known. Probably there were stray instances of cross-breeding work done by individuals ever since the arrival of the European planters. There is evidence that in the earlier part of the 19th century such work was undertaken by some enthusiastic civil officers of the East India Company [3]. Perhaps the cross-breeding work using the exotic breeds of bulls started taking place in some systematic way only after the establishment of cattle breeding farms on scientific lines some time during the earlier part of the 20th century. Earliest reports of cattle breeding in India are available since 1906. The reports by W D Gunn (1906) Mollison and French (1907) and Morgan (1907) show that they were aware of the importance of the cross-breeding work. *It should be* however noted that none of these were enthusiastic about a large scale cross breeding programme as they probably felt that it would lead to failure. In the earlier years it appears that the main difficulty faced in cross-breeding was to get the stud bulls of the exotic variety. There was also a fear that the exotic breeds would not stand the Indian climatic conditions.

While reporting on the cattle conference held at Lucknow Moreland (1910) recognised the fact that in India it is the buffalo which is the real milch animal and not the cow, the cows being mainly maintained for producing quality draught bullocks. He therefore thought that it was no use introducing the exotic blood among the Indian cattle which might result in gain in milk yield at the cost of draught power use.

There was however sporadic work of cross-breeding done in different parts of the country by enthusiastic British Civil Officers and Planters. Later on, the cross-breeding work was undertaken very rigorously on the military farms which resulted in large scale propagation of certain cross-bred cattle in restricted pockets of India.

The evidence given by Henderson before the Royal Commission on Agriculture in India in 1927 suggests that the work on cross breeding of cattle started in this country as early as 1875 [18]. In Bihar, around Patna city, the cross-breeding was said to have been evolved by using either Kerry or short horned bulls on the local cows resulting iny a new breed named as Taylor breed. Over a period of time, these cross-bred cattle were interbred and were multiplying in the natural process of propagation. The report of the Central Council of Gosamvardhana (CCG) Committee on cross-breeding in 1963, however, reported with insufficient factual data to substantiate their point that the Taylor breed had deteriorated over the period as a high milk yielder [4]. Probably this might be true due to the low feed availability of the agricultural economy in Bihar State.

The tea planters who settled in the hilly areas of North eastern part of India and also in the South ventured cross-breeding work on their own. Though we do not have any factual information regarding the cross-breeding work done in the hilly areas of Assam and Bengal, we have some information and a lot of direct evidence to show that cross-breeding work was done on a large scale in the Nilgiri hills. The work in the Nilgiri hills probably started nearly a century ago and during the course of time the major portion of the local breeds of cattle crossed with the exotic breeds such as Ayrshire, Friesian and Jersey. The cross-breeding work undertaken by the people in the Nilgiri hills, though very unsystematic in its approach, was quite successful in its results. Cross-bred cows from the Nilgiri hills were in high demand in both Tamil Nadu and Karnataka. There was definitely an improvement in the milk yield and the animals did not face any problem of morbidity or mortality due to climatic factors. The success of this programme in the Nilgiri hills appears to have taken place for another reason. In the Nilgiri hills the bullocks are not used for cultivation purposes on a large scale as the topography of the land does not permit such practice. Most of the farm practices are carried on by the human labour by using hand implements. There was thus, no loss in the draught power availability by resorting to cross-breeding programme. Besides, in the Nilgiri hills, the plentiful availability of green grasses did not pose the problem of fodder. The climatic conditions are also quite congenial for the development of the cross-bred cattle.

The most extensive cross-breeding work in India has been done at the military farms. The cross-bred cows are maintained at farms scattered over the sub-continent. Most of these farms are located at hill stations. The milk requirement of the military personnel is met through these cross-bred cattle at the military dairy farms.

The information available through the military farms has been of much use in *propagating and extending of* the

cross-breeding programme in India. But as most of these farms are located in the hill stations where the climatic conditions are congenial for the development of the exotic breeds and the availability of fodder and green grasses is not a problem, the experiences of the military dairy farms may not be blindly applied to the general farm conditions in other parts of the country [3].

During recent years, the programmes like Operation Flood and Key Village Programme are aimed at intensifying the cross-breeding of the cattle programme so that the counting would achieve higher level per capita availability of milk [15]. Government has also made collaboration with some developed countries in introducing the cross-breeding work in an intensive way. Instances may be quoted of the Indo-Swiss Project of cattle-breeding programme in Kerala and the Indo-Danish dairy project in Karnataka undertaken during 1963-64 [26, 16].

The various programmes started in the recent years to expedite the cross-breeding work in India indicate that certain state governments are keen to get their cattle population upgraded with a view to increasing the milk yield. It may be noted that these programmes are intensively undertaken in the traditional cattle breeding areas like Southern Karnataka and parts of Tamil Nadu. The indigenous cattle breeds like Hallikar and Amritmahal in Southern Karnataka and Kangayam in Tamil Nadu are known for their draught power use. The extension of the cross-breeding programme in these areas is likely to degrade the draught power efficiency of some of these quality draught breeds. At the same time it should be noted that the extension of the programme in the hill regions in Kerala as well as Malnad regions of Karnataka may be of great help in upgrading the non-descript indigenous cattle breeds which are neither good for draught power nor for milk production.

The organisation of the extension of the cattle breeding programme depends upon the number of cows in fecundity age group within the region of the service centre, efficient use of the exotic semen and the technical personnel who handle it and also the efficiency of the contract agency which persuades the cow owners to get their cows inseminated with exotic semen. In the areas where the cross-breeding programmes are undertaken intensively, the organisational aspects of the extension work appears to be quite efficient. Though the ultimate aim of the programme is to cover all the indigenous cattle population in the region by artificial insemination with exotic semen, it may not be possible to do so especially at the earlier stage of the implementation of the programme. First, most of the cattle owners may be unwilling to get their cows inseminated with exotic breeds because they are afraid that the male progeny may not be of efficient use for their agricultural operations. Secondly, it may not be possible for artificial insemination centres to meet the requirements of the farmers owning cattle in the remote areas. Thirdly, the availability of exotic semen which is a scarce resource may not be sufficient to meet the demand. Fourthly, it could be a fact that cross-bred progeny is likely to be highly susceptible to some diseases which may result in high mortality rates. Lastly, the feed requirement of the cross-bred animal is relatively high and many of the cattle owners who have limited fodder resources may find it rather beyond their reach to go for cross-breeding.

In Southern Karantaka, the farmers usually maintain cows to produce quality bullocks for draught purpose. The male calves of the cattle are sold in the cattle fairs which take place in a number of places. During the period between January and April, the cattle fairs which are held in different parts of the region attract the male cattle. The bullocks are bought directly by the users as well as by the middle men. The middle men further take the bullocks to distant places and sell them to the direct users. In these fairs the male calves of the cross-bred do not fetch competitive prices as it is the general feeling that the cross-bred males are not as efficient as the indigenous bullocks. Usually the cross-bred male calves are sold at a very low price and are bought by the butchers [22]. The farmers in the region who are basically draught cattle breeders are somewhat reluctant to get their quality breeds of the cattle cross-bred with the exotic semen [25].

In Western India, where the cross-breeding programme is undertaken rigorously by a voluntary agency like Bharatiya Agro-Industries Foundation, usually the cows which are brought for artificial insemination to the centres do not belong to the local draught breeds. The milch breeds like Gir and Red Sindhi are further upgraded by cross-breeding and the farmers are not prepared to get their indigenous draught cattle degraded from the point of view of draught power efficiency.

In Kerala, however, the response of the cattle owners to get their cows artificially inseminated with exotic semen is quite encouraging. The reason appears to be that the non-descript breeds of cattle in Kerala are efficient neither as milk yielders nor as draught animals. As most of the cattle owners in Kerala are small holders with meagre fodder resources, traditionally they prefer to keep cows which required very low level of feeds. The appearance of a buffalo as a milch animal in the Kerala economy is also on a sizeable scale probably because of the same reason. The buffalo yields more than what a cow yields. Another factor which has influenced the upkeep of the most inferior quality cattle population on a large scale appears to be that in Kerala, the draught animal is usually the he-buffalo and not the bullock. The male progeny of the cattle is usually sold to the butcher for beef.

Another hurdle in the extension of the cross-bred programme is that the artificial insemination services are difficult to be extended to the remote areas. Further, it is alleged that the exotic semen which is a scarce resource is not available to cover a large part of the cattle population. The evidence available with us however reveals the contrary. In those areas, where the intensive cattle development programmes are in operation, even the remote areas are covered by the artificial insemination service. There is no complaint received by any artificial insemination centre regarding the non-availability of exotic semen. The information gathered from both Tamil Nadu and Karnataka reveals that both exotic semen availability and the availability of the technical personnel who handle it is sufficient to cover the whole cattle population in their respective regions. On the other hand there is a problem of underutilisation of the technical overheads so created resulting in per animal insemination cost go up very high. This problem is faced by even the highly developed cross-breeding centres like the Indo-Danish dairy unit in Karnataka as well as the Indo-Swiss Project in Kerala. The information available through the cross-breeding work done by Bharatiya Agro-Industries Foundation also reveals that the technical overhead costs are too high and there is sufficient scope for economising on that ac-

count. It is possible only by covering large number of cattle population.

It is also true that the mortality rate among the cross-bred cattle is very high. The mortality rate especially among the cross-bred calves appears to be relatively higher than that among the calves of the local breeds [22]. This creates a sort of unwillingness among the cattle owners to get their cows cross-bred with exotic semen. In Karnataka, most of the cross-bred calves brought from the Nilgiri region face very high mortality rates as soon as they reach the plains. In 1971-72 under the SFDA programme a large number of cross-bred cows were brought from the Nilgiri hills and distributed among the small farmers in Mysore district. According to an estimate, the mortality rate of these cows in the first year was 24 per cent. The mortality rate was very high and the milk yield came down drastically [32]. The study made in the Bangalore Milkshed area also suggests that the cross-bred cows by the small farmers mostly remained dry as a result of undernutrition [25]. Nevertheless it is too early to make any serious comment on the problem of the higher morbidity rate among the cross-bred cows as the information available is insufficient.

The feed requirement of the cross-bred cattle is definitely higher than that of the local cattle. The local cattle are usually fed with the straws of the cereals and millets and also the residual part of the pulse crops. It is rarely that they are fed with the green grasses or concentrates. This is however not possible if one wants to maintain the cross-bred cow, not only when the cross-bred cattle require more feed per animal but also when the feed basket of the cross-bred is qualitatively superior. Cross-bred cattle are to be fed with the green grasses and the concentrates along with the dry fodder. As the fodder resources are not available in plenty with many Indian farmers, they are reluctant to go for class-breeding which requires not only more fodder resources, but also the concentrates. This is particularly true in respect of the small and marginal farmers who possess meagre fodder resources [25].

The extension work in the cross-breeding programme is so far confined only to the artificial insemination of the indigenous cows with exotic semen. It should be realised by the extension agency that the feed basket of the cross-bred cattle is entirely different from that of the indigenous cattle. The extension work should also aim at developing fodder resources and also concentrates which could be prepared out of the locally available resources. It is rather difficult to convince the small farmer to devote a part of his land for growing fodder grasses. If dairy is also considered as an enterprise connected with the other crop enterprises, there is no reason why farmers should not show any interest in allocating part of the land for growing fodder grasses. In the areas where the cross-breeding work is supposed to have been successfully implemented, there is no sign of any change in the cropping pattern. This shows that the owners of the cattle have made no attempt to mobilise their fodder resources by allocating a portion of their area for fodder grasses or by changing the areas under cash crops to cereal crops.

The extension work should therefore simultaneously aim at the introduction of the cross-bred cattle and the development of the fodder resources as well as manufacture of the concentrates based on locally available resources. It may not be so easy to ask the farmer to change his cropping pattern as it is based on some of the built-in constraints of his farm business. There should be some structural changes in his farm business itself if he desires to add a dairy enterprise consisting of cross-bred animals. The extension activity should aim at demonstrating reconciliation of the cross-bred animals and the cropping pattern of selected farmers. Such demonstrations, when they are economically successful would induce the other farmers to go for cross-breeding.

IV

Three Case Studies

In this section we shall present three case studies of the areas where the cross-breeding programme is supposed to have been successfully implemented.

A: *Indo-Swiss Project, Kerala:*

A study of the Cattle-Breeding Programme of Indo-Swiss Project, Kerala was initiated at the instance of the Swiss Development Co-operation, Embassy of Switzerland [26]. The study was conducted in the districts of Idukki and Alleppey where the extension activities of the Indo-Swiss Project were in progress and first cross-bred generation were already available at the time of the survey. Two stage random sampling technic was adopted for selecting the cattle owners. In the first stage, the study area was divided into (i) the extension area and (ii) the controlled area. In the second stage, the cattle keepers were divided into three categories; (1) cattle owners in the plains (Alleppey district); (ii) settler farmers in the high ranges (Idukki district); and (iii) the tea estate labourers in the high ranges (Idukki district).

The collection of data was done by adopting cost accounting method through specially structured questionnaires. The cattle in the study area were classified into three groups; (i) Brown Swiss Cross-breds (BSC); (ii) Non-descript (ND) and (iii) Graded Cattle (GC).

The study revealed that the households mainly reared cattle and very rarely the buffaloes. Dairying was followed as a subsidiary occupation by a majority of the households. Stall feeding of the cattle was very common in the plains as green fodder was scarce. Extensive grass lands were available in the high ranges and the cattle belonging to the settlers and tea labourers grazed on those lands. The settler farmers usually supplemented grass land grazing by concentrates while the tea labourers depended almost exclusively on grazing. In the plains concentrates constituted the main source of nutrients for cattle whereas cattle belonging to the settler farmers depended mainly on green fodder. The cattle belonging to the tea labourers were reared exclusively on grazing. The cattle owners in the extension area took better care of their animals, irrespective of breeds, as compared to cattle owners in the controlled area. The BSC young stock was usually better cared for than the young stock of other breeds.

It was revealed that the cattle feed availability in the study area was far less than its requirement. The scarcity of fodder generally led to the underfeeding of the young stock of all the grades of cattle. The underfeeding was more prominent in respect of the young stock maintained by the tea labourers. This reflected in delayed maturity and less than optimum productivity after attaining the breedable age. The present feeding standards followed in respect of the milch cows were far below the recommended levels. In the case of the cows belonging to the tea labourers the availability of Digestible Crude Protein (DCP) fell to about 15 per cent of the requirement even in the case of the BSC animals especially during the dry season. The tremendous fodder shortage felt in the area during the

dry season resulted in low milk yields of the BSC cows. The nutrition requirements of the dry cows of all grades was never met fully either in the plains or in the high ranges. This resulted in loss of body weight, decline in milk production and abnormality in reproduction behaviour of BSC cows. It should be noted that though the BSC cows yielded more milk than GC and ND cows, the genetic potential in terms of higher milk yield of the BSC cows was not fully exploited mainly because of undernutrition of BSC cows.

Though the maintenance of cost of the BSC animals is quite high, it was more than compensated by the increase in the milk yield resulting in the lower cost of milk production. The cost of production varied from area to area as it mainly depended upon the availability of green roughage. The cost of feed per litre of milk varied from Rs 1.21 in the plains to only Rs 0.15 with tea labourers in the high ranges. The net income per cow was the highest in respect of the animals fed predominently on the farm grown roughage.

The relationship between milk yield (Y) and independent variables like lactation stage of the cow in months (X_1), *girth in cms* (X_2), value of the green fodder in rupees fed daily (X_3), value of the dry fodder in rupees fed daily (X_4) and value of the concentrates in rupees fed daily (X_5) was established by two types of production functions, namely linear and Cobb-Douglas. The regression co-efficient showed that the unit increase in the availability of green fodder and concentrates resulted in maximum increase in milk production in respect of BSC cows with tea labourers followed by BSC cows with settlers and cattle keepers in the plains. This indicated that the improvement in the fodder availability would definitely result in higher milk yields of the BSC cows. The comparison of the regression co-efficient for green fodder and concentrates indicated greater likelihood of increase in milk production with increase in green fodder supply especially in respect of the BSC cows, with cattle keepers in the plains and with the settlers. For tea labourers the concentrate ratio needs to be enlarged as against the green fodder to increase milk yield. It was also revealed that the increased supply of green and dry fodder in respect of ND cows resulted in higher milk yields.

The impact of the extension programme was reflected in the higher consumption and the marketable surplus of milk per household in the extension area than in the controlled area. This indicated that there was sufficient scope for further development of milk marketing in the areas covered by the cattle breeding programme.

The study also mentioned the urgency for developing the fodder resources along with the intensive implementation of the cross-breeding programme. It was suggested that certain types of fodder crops could profitably be cultivated as inter crops in coconut gardens, especially in the plains. In the high ranges of Kerala, the hybrid *Napier grasses could be introduced as* high-yielding fodder crop.

The Indo-Swiss project for cattle breeding and fodder production has made extremely important contribution in increasing the milk yield of the cattle and also in raising the economic status of the cattle keepers in the area. The future success of this programme depends upon a sort of integrated package programme comprising cattle breeding, fodder production, veterinary aid, milk marketing and credit availability.

B: Bangalore Milkshed Area:

In order to examine the possibilities of improving the economy of the small farmers through cross-breeding of cattle programme, the Institute for Development Research (Denmark) undertook a research project in Bangalore milkshed area of Karnataka [25]. The cross-breeding of cattle was undertaken intensively under the Intensive Cattle Development Project in the Bangalore milkshed area.

On the basis of the size of the cultivated holding, occupation and income, the households were divided into five socio-economic groups. It is important to note that the cross-bred cattle were much more unequally distributed among the socio-economic groups than the local cattle. As buffalo is the traditional milch animal in the area it was also included in the analysis. It is interesting to note that it is particularly the medium size farmers who relied on buffaloes as milch animals. The small farmers and landless labourers could not afford to have either buffalo or cross-bred cattle. As artificial insemination is offered free of charge, one may expect that there was a great demand for getting this service to the local cows. However, the farmers were unwilling to have their cows artificially inseminated. They were aware that the cross-bred male progeny was inferior to the local male for draught purpose. Opinions, however, differed on this question, though it was accepted by everybody that the cross-bred cattle work more slowly and do not stand the heat.

In Bangalore milkshed area, almost all the farmers knew about the milk yield potentiality of the cross-bred cows, but still they did not take their local cows to the artificial insemination units. In this connection one should understand the complicated relationship between the breeding of draught bullocks and the cross-breds. The farmers in the area find it more economic to go for breeding the draught cattle rather than for cross-breeding.

It was seen that the milk yield potentiality of the cross-bred cows was better exploited by the big farmers rather than small farmers. The big farmers have ample fodder resources whereas the small farmers do not. Three-fourth of the cross-bred cows belonging to the small farmers and landless labourers, it was noted, did not give any milk at all. In the case of cows in milk the average yield varied considerably among those belonging to the different socio-economic groups. The variations in milk yields are no doubt *due to differences in the feed*ing pattern. Traditionally, the local cattle are fed with rice and ragi straw. The farmers did not respond positively to the extension workers' recommendation to grow fedder grass on part of the irrigated land. They preferred to use their valuable irrigated land for rice or easily marketable crops such as sugarcane or vegetables.

The variation in milk yields applies particularly for cross-bred cows. The variation in the yields of local cows and buffaloes was not very wide among the socio-economic groups as the feeding pattern remained the same. The milk yields in the case of the local cows and buffaloes were less responsive to concentrates.

While introducing the cross-bred animals in the area, the particular needs and constraints of the small farmers were never taken seriously into consideration. The study has presented ample evidence to show that the cross-bred cow is economically too unmanageable especially for small farmer. The buffalo requires much less initial finance as well as low cost of maintenance. If the production potential of local buffaloes could be improved through artificial insemination with semen from high-yielding Indian buf-

faloes, most of the farmers may prefer such a programme to the present cross-breeding of cattle programme. The farmers with a limited fodder resources are familiar with buffalo management whereas it is quite costly for them to go for cross-bred cattle.

C. Voluntary Agency:

Bharatiya Agro-Industries Foundation, Uruli Kanchan, a voluntary agency in Western India, undertook cattle-breeding programme in 1970. The evaluation study of this programme was undertaken by the Indian Institute of Management, Ahmedabad [46].

The study aimed at making a detailed enquiry of the economic problems of the cross-bred and indigenous cattle. It also aimed at finding out the attitude of the farmers towards the cross-breeding programme using the data on maintenance cost and milk yield. The economics of maintaining indigenous cows as against that of cross-bred cows was calculated for one inter-calving period. Since the purpose of this analysis was to compare the relative merits of indigenous cows and cross-bred cows, only the milk production aspect was taken into account. No attempt was made to calculate the sales value of cows and cowdung.

The cost of maintaining indigenous cows was calculated on the basis of 270 days of lactation and 150 days of dry period. While calculating the cost components, only out-of-pocket items were included. The total out-of-pocket items involved in maintaining the indigenous cow for an inter-calving period of 420 days was estimated at Rs 1,118. The average milk yield during a given lactation was 1,118 litres. At the rate of Rs 2.10 per litre in value terms, it amounted to Rs 2,347. The cow owner got a net return of Rs 1,229.

For cross-bred cows the lactation period was taken to be 340 days and the dry period to be 90 days. The cost of maintaining a cross-bred cow for one inter-calving period came to Rs 1,821. The average milk yield in lactation was 2,077 litres. At the rate of Rs 2.10 per litre in value terms it amounted to Rs 4,363 which gave a net return of Rs 2,541.

The sample farmers usually felt that cross-bred cows gave higher milk yield as compared to indigenous cows. A majority of the farmers who were interviewed were of the opinion that the fat-content of the milk of the cross-bred cows was higher than that of the milk of the indigenous cows. Besides, all farmers believed that a cross-bred cow matured at an earlier age than an indigenous cow and it also maintained a higher regularity in breeding. Most of the farmers felt that cross-bred cows had special feeding requirements such as use of concentrates and also green fodder on large scale.

It was observed that the benefits of the cattle-breeding programme went to the medium size and large farmers who were the members of the sugarcane co-operatives. The small farmers rarely went in for getting their indigenous cows cross-bred.

V

Economic Impact of Cross-Breeding Programme

To formulate a viable programme of cross-bred cows, it is necessary to have data on the economy of cross-bred cows. During the last 10 years or so, the National Dairy Research Institute, Karnal has undertaken cost studies of milk production. Unfortunately, the data of costs of milk production are not available in complete form [19]. Moreover, most of the cost studies are believed to suffer from certain serious flaws. It is also true that a number of cost studies confine themselves to variable costs ignoring capital costs. Most of these studies are related to one or two specific years and do not cover the entire life period of milch animal. It should be noted that the cost of milk produced varies from lactation to lactation.

The estimate of household expenditure on account of maintenance of livestock population in the rural areas of the country is provided by the National Sample Survey (No 65, July 1955 to June 1956). Chatterji and Goswamy have obtained estimates from that report with regard to the cost of feed, cost of services rendered for herding and cost due to medical and other services [5]. The cost of milk is obtained by dividing the cost of maintenance, cost of depreciation of animals and cost of services per milch animal by quantity of milk produced. Thus

$$\text{Cost of milk per seer} = \frac{\text{Cost of maintenance of milch animals} + \text{depreciation of animals} + \text{cost of services}}{\text{Quantity of milk produced.}}$$

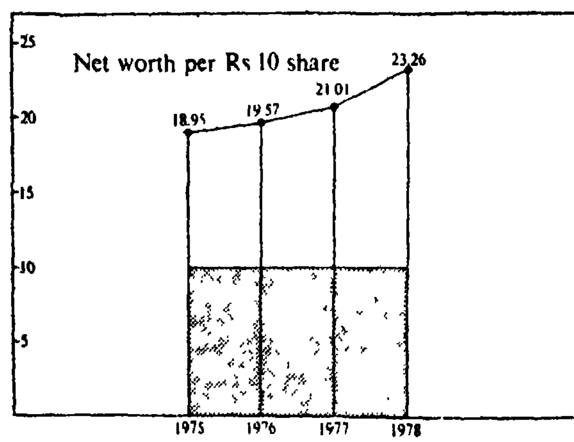
Annual milk production is also estimated for cows and buffaloes separately by the NSS report. It could be seen that the cost of cow milk per seer is Re 0.42 and Re 0.47 for non-cultivator households and cultivator households respectively. Similarly cost of buffalo milk is worked out at Re 0.32 and Re 0.20 respectively for the two types of households. It is clear from the NSS data that the unit cost production of milk in the case of the buffaloes is lower than that in respect of the cows (Table 3).

It is also revealed from the same report that both buffaloes and cattle are fed with green fodder and dry fodder and straw which is mainly self-produced. The purchased inputs like oil cakes, seeds and oil seeds, salt and other minerals and concentrates are used on a small scale either for buffalo or cattle. Buffalo as a milch animal is far superior to indigenous cow either in respect of the milk production or the cost of milk production per unit. This is the main reason why traditionally the buffalo is preferred as milch animal in India [49].

Though we do not have sufficient information to demonstrate the superiority of the cross-bred cow over the indigenous dairy cow or over the buffalo, the scanty evidence available recently indicates that the cross-bred cows are superior to either the indigenous dairy cows or the buffaloes [16, 13, 20, 39]. The study conducted at the National Dairy Research Institute, Karnal, for the year 1973-74 reveals that a cross-bred cow is far superior to indigenous cow in many respects. Among other things, the study reveals that the cross-bred cow gives the first calf early (831 days) compared to the pure breeds (1,077 days). The cost of the calf rearing was lower in the case of the cross-bred (Rs 2,435) than in the pure breed (Rs 3,132). The feed cost was observed to be the most important component accounting for about 76 per cent of the total cost. The lactation length, dry period and the period between two calvings are lower in the cross-bred and the milk production is much higer. The cost of the milk production is 95 paise per litre in the case of the cross-bred as compared to 1.48 paise per litre for indigenous dairy cow. In the case of the pure breed cows, the per litre cost of milk production tended to increase after the third lactation while in the cross-breeds the per litre cost continued to fall even upto the seventh lactation [34].

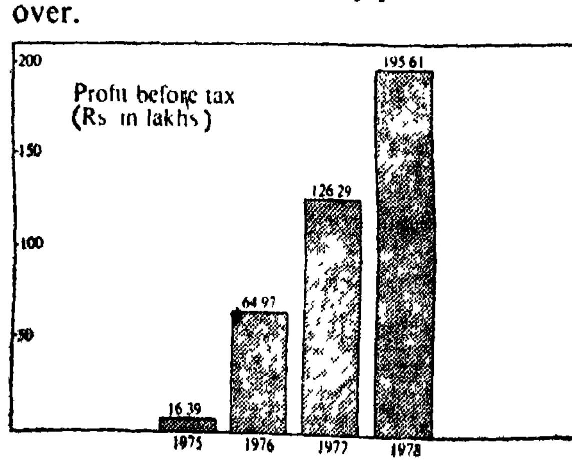
A Rs 10 share with a net worth of Rs 23. Need we say more?

TI of India has been ploughing back profits... to build up reserves. While it has not skipped dividend even once in the past 20 years.



We believe in the manufacture of high quality products. In investment in superior technology. And in steady diversification into promising lines of operation. All with a view to increasing profitability.

As a result, the company has, over the years, created for itself a solid financial base... upon which it is now building its future.



Consider the facts:

Our profits have been rising steadily... an indication of our momentum in recent times.

Our reserves are more than our paid-up capital.

Our dividend is covered by profits twice over.

At the Southern Regional Station of National Dairy Research Institute, Bangalore the study on the economics of milk production was taken up for Jerthar cross-bred cows, triple cross cows and buffaloes. The gross cost of production of one kg of milk was found to be Rs 0.99, 0.80 and 1.77 respectively and net cost at Rs 0.94, 0 76 and 1.69 respectively for Jerthar cows, triple cross cows and buffaloes. The average milk yield in the case of the three categories of the milch animals mentioned above was 6.7 kg, 8.7 kg, and 3.7 kg respectively. Among the cross-bred cow and she-buffalo, the former is more efficient in respect of milk production [38].

Daroga Singh has made an attempt to study the relative performance of cross-bred cows and pure-bred and graded buffaloes in respect of production as well as adaptability characteristics under farm and field conditions. According to his observations, the mortality upto calving was 22 per cent among cross-bred as against 35 per cent among Murrah buffaloes. It was however as high as 48 per cent in respect of the graded buffaloes. Annual mortality rate among the adult females was slightly less among buffaloes than among cross-bred cows [43].

Cross-bred cows were younger on first calving by six months as compared to buffaloes. Besides, the cross-bred cows have a shorter calving interval than the buffaloes. These adaptability characteristics show that even an average cross-bred cow has been able to withstand the local conditions better than the two well established breeds of buffaloes.

The yield of cross-bred averages 2,200 kg as against 1,400-1,750 kg of different breeds of buffaloes, maintained under similar conditions of feeding and management. Yield per day of lactation period and yield per day of calving interval followed the trend similar to that of lactation yield. Lactation length was lowest among the graded buffaloes and was of the same order for cross-bred cows and other buffaloes (Table 4).

The cross-breds would give about [illegible] times the total yield as that of the buffaloes. However, in terms of fat production, the performance of the buffaloes is slightly better than that of the cross-bred animal. Thus, not only in respect of adaptability characteristics but also in respect of production characteristics, the cross-breds are superior to different breeds of buffaloes.

In respect of draught capacity, it is well known that the indigenous bullocks are far superior to he-buffaloes except in some monsoon paddy regions. It is however, important to see whether the cross-bred bullocks are comparable with the indigenous bullocks. An experiment was conducted at the National Dairy Research Institute, Karnal, to test the adaptation of the cross-bred bullocks to Indian farm conditions and the comparison of their draught capacity with that of the indigenous breed. The various parameters assessed were (a) time taken by each pair to plough the measured area (b) pulse rate and (c) respiration rate. The experiments were done in respect of climatic conditions like winter, summer and hot humid conditions. Work capacity of cross-bred and the Haryana bullocks was measured in regard to these three climatic conditions. In respect of pulse rate or respiration rate, Haryana draught cattle was found to be superior to the cross-bred cattle. In respect of area ploughed in six hours, again, the Haryana breed was found to be superior to the cross-bred cattle, though the difference was not very much. During winter season a pair of cross-bred cattle ploughed 2,970 sq mts whereas the Haryana breed ploughed 3,320 sq mts. During summer, cross-bred cattle ploughed 2,860 sq mts and the Haryana cattle ploughed 3,070 sq mts. Under hot humid climatic conditions the area ploughed by the cross-bred cattle and the Haryana breed was 2,440 sq mts and 2,903 sq mts respectively (Table 5).

It is not sufficient to get oneself satisfied with the work performance between cross-bred cattle and the Haryana breed which does not vary significantly An important fact that should be noted is that the cross-bred animals require more feeds than the indigenous draught animals. Though it is some times argued that as the cross-bred males are nearly as efficient as the Haryana breed, they should be far superior to many of our nondescript draught breeds, the fact that the cross-bred cattle need better feeds, qualitatively and quantitatively than the indigenous draught cattle breeds should not be forgotton. So, the physical efficiency of the cross-bred males in draught power should not be mistaken with the economic efficiency. As the evidences show that a cross-bred animal requires feeds at least one and a half times that of an indigenous cattle, the economic efficiency of the cross-bred animal works out to be two-thirds of that of the indigenous cattle. Besides, if physical inefficiency is also accounted for, probably, it could be proved that a cross-bred cattle is far more inefficient than an indigenous cattle in respect of draught power.

If one takes into account the same parameters like pulse rate, respiration rate and the time taken to plough the measured area in respect of indigenous draught cattle and the he-buffaloes, one would find probably the same type of results. The Indian farmers have rejected the he-buffalo as a draught animal not just because it is very inefficient in the draught power, but because it is uneconomic to keep he-buffaloes for cultivation purpose. He-buffalo requires, just as the cross-bred males, more feeds than indigenous cattle.

In this regard, he-buffalo compares very well with cross-bred male progeny. As the Indian farmers have rejected the he-buffalo for draught purpose, similarly they are likely to reject the cross-bred bullocks for the same purpose. This should have different implications. First, as in the case of the buffaloes, among the cross-bred cattle also, the females will be preferred to the males. This may result in an adverse sex ratio especially among the adult animals. Secondly, the farmers may prefer to dispose of the male calves as early as possible either by selling them to the butchers or by killing them through starvation. Thirdly, when the cross-breeding programme is undertaken on a large scale, it may create a situation of scarcity of draught animals in the economy. A situation may arise when the cattle development policy makers will have to reverse their policy so that the breeding of the draught cattle will be given prior importance.

VI

Conclusion

The cross-breeding programme for the cattle was introduced with a view to upgrading the low-yielding indigenous milch cattle so that their milk yield potentiality would get enhanced. Such a programme may result in (i) physically and economically inefficient draught cattle; (ii) the alleged higher morbidity and mortality rates leading to larger liability on the parts of the

cattle owners; and (iii) fodder constraint leading to a situation where the high milk yield potentialities' remain untapped.

The physical and economic draught power inefficiency of the male cross-bred and the high milk yield potentiality of the female cross-bred would induce the cattle owners to prefer the female progeny to that of the male. The males would be eliminated by undernutrition or deliberate butchering. Thus the sex ratio among the cattle would be unfavourable to males as it is the case with the buffaloes, which would ultimately result in shortage of draught animals.

Added to this, the alleged higher morbidity and mortality rates among the cross-breds would lead to longer liability on the part of the cattle owners. The cattle owner would give unequal medical treatment to male and female cattle, the latter being better cared for than the former. This would again result in higher death rate among the male cattle.

The policy of eliminating low producing stock progressively so that the limited feed and fodder resources would be made available for proper feeding of high producing animals would ultimately end up with underfeeding of these superior animals whose high milk yield potentiality would remain untapped. The small farmers would not be in a position to keep the cross-bred cattle as the fodder resources available with them would be inadequate to meet the requirement. If it is necessary for them to keep such animals, their milk yield would decrease drastically. One would find that the full potentialities of milk yield of the cross-bred would be tapped by the resourceful farmers only, and small and marginal farmers, when they keep the cross-bred cows, the milk yield would be quite low.

The cross-bred cattle require not only more fodder per animal but also a qualitatively superior feed-basket. The large scale demand for concentrates to feed the cross-bred cattle may result in shortage of some cheaper millets and inferior pulses which are presently consumed by the most vulnerable sections of the society. On the other hand, buffalo as a milch animal consumes mainly the crop residues which are not covered by human consumption — a fact which is sufficient to advocate the superiority of buffalo over cross-bred cow as a milch animal suiting the Indian socio-economic requirements.

The cross-bred cattle, for some of the reasons mentioned above, may not fit into major agro-economic situation in the country. In such situations, the programme will be rejected. In the areas where demand for milk is increasing as a result of urbanisation and higher income levels, some urban-oriented milk producers or commercial farmers with medium of large holdings may go for cross-bred cattle. And also in those hilly areas where the draught power requirement for the agricultural operations in quite low and where cattle meat is an important component of the food basket, cross-breds may be preferred, and they may thrive there. But such areas are quite few in the country and the scope for the extension of the cross-bred cattle is thus highly limited.

THE G. S. GHURYE AWARD FOR 1978

An award called the G. S. Ghurye Award for the best published work in Sociology and Anthropology has been established in the University of Bombay. It consists of a cash prize to be awarded annually to an Indian author for a book or monograph in English on a subject in Sociology or Anthropology which in the opinion of the Award Committee is the best published work of the calendar year. Books and monographs published in India and abroad will be considered for the award.

Suggestions for the 1978 award are hereby requested. The name of the author and publisher and the title of the book should be sent to the undermentioned as early as possible.

Prof J. V. Ferreira Department of Sociology University of Bombay Kalina, Bombay 400 098	Prof. T. N. Madan Member-Secretary ICSSR, IIPA Hostel Indraprastha Estate New Delhi 110 002	Prof. A. R. Desai President Indian Sociological Society Jai Kutir, 1st floor Taikalwadi Road, Matunga, Bombay 400 019

1977 Dr (Mrs.) Veena Das for "Structure and Cognition: Aspects of Hindu Caste and Ritual"

Milk Production in Kerala

Trends and Prospects

K Narayanan Nair

As part of the national strategy for augmenting milk production, cross-breeding and upgrading of milch cattle has been taking place in Kerala during the last two decades. The programme, moving at a slow pace in the 1950s and the 1960s, has been accelerated in the 1970s, and much effort has gone to improve the coverage and efficiency of the programme.

This paper attempts to examine the contribution of animal husbandry and dairy development programmes to the increase of milk production in Kerala. Its chief findings are:

(1) that there has been a considerable increase in the productivity of milch animals and total milk production in Kerala;

(2) that the profitability of milk production has gone up over the years; and

(3) that milk production in Kerala is mainly undertaken by small and marginal farmers.

The paper also makes some broad projections of the demand for milk and milk products by 1990 and concludes that a mere programme of improved cross-breeding cannot possibly meet the projected demands.

The paper briefly touches upon the recent demands for a ban on the slaughter of cows in Kerala and argues that there is no economic rationale behind such a demand. Any ban on the slaughter of cows in the state would be totally harmful to the growth of the livestock economy; and would surely affect adversely several development projects already undertaken.

I

Situation in Kerala

CATTLE dominates the bovine wealth of Kerala; their productivity is low compared with many other regions in India.[1] This low productivity is due to the cumulative effects of (a) the rapid rise in human population leading to expansion in cropped area and greater intensity of cultivation resulting in a progressive reduction in the availability of grazing facilities and accentuating the competition between man and animal on land; (b) the poor quality of the grazing land; and (c) the dominance of monoculture in the cropping pattern.[2]

The poor livestock situation in Kerala was noted by a number of 19th and early 20th century writers on Kerala agriculture.[3] There were also attempts to improve the quality of the cattle population by cross-breeding the domestic stock with imported breeds of high quality from other parts of India and even from Britain.[4]

Organised attempts to develop animal husbandry in Kerala started only during the Second Five Year Plan when the Key Village scheme was introduced and facilities were provided for artificial insemination.[5] Eight key village centres were established during this Plan period.[6] This scheme has continued to operate in the successive Five Year Plans and currently fourteen of them are functioning in the state.[7] In 1968, as part of the all-India special programme for cattle development, an intensive cattle development project was started, and later one more unit was added.[8]

Besides these schemes, the Indo-Swiss Project and the Department of Dairy Development have also taken up a major programme for cross-breeding.[9] The Indo-Swiss Project, located in the high ranges in the Western Ghats, was started with the objective of creating a new species of cross-bred cattle adapted to Indian conditions and to encourage scientific production of fodder. The setting up of a semen bank and liquid nitrogen plant for deep-freezing of bovine semen as part of this Project was an important step in the cattle development of Kerala.[10] The extension of work of this Project was started in the high ranges during 1967-68 and later, in collaboration with the state animal husbandry department, the activities of the Project were extended to the Mavelikkara region of the ICDP. The dairy development department's scheme was taken up under the Special Employment Programme and it proposed massive cross-breeding to cover one million cattle of breedable age by using semen collected from exotic bulls of high production potential. About 1,000 inseminators were trained under this scheme and they were provided facilities to undertake artificial insemination on a payment basis.[11] This scheme was launched in 1972-73.

In the cattle breeding projects outlined above, three exotic breeds were used for cross-breeding. In the key village scheme Sindhi was mainly used for cross-breeding. Jersey was also used in one of the ICAR-sponsored cross-breeding schemes, but on a limited scale. In the ICDP unit started in the Fourth Plan, in three sub-units, Jersey and in one unit Brown-Swiss were used. In the second ICDP, Jersey was used. When the massive cross-breeding programme was started Brown-Swiss in the four southern districts and Jersey in the remaining districts were used. Steps were also taken during the plan periods to establish bull stations and semen storage facilities.[12]

Along with the programme for breed improvement there were also attempts to provide facilities for procurement of milk from the rural areas and for its processing and distribution in urban centres. At present, there are over 500 dairy co-operatives in the state involved in the procurement of milk and supply of inputs to milk producers.[13] Steps were also taken to install 24 chilling plants and seven dairy plants with a total handling capacity of 56,000 and 61,000 litres per day respectively.[14] There has also been significant improvements in animal health services. At present there are 532 veterinary hospitals functioning in the State.[15] Out of this 408 hospitals are managed by veterinary surgeons, 12 are mobile veterinary dispensaries and the remaining are veterinary sub-centres without adequately qualified technical personnel. In other words for every 7,000

TABLE 1: AVERAGE DAILY YIELD PER COW AND SHE-BUFFALOES IN RURAL AND URBAN AREAS OF KERALA

State/Region/Species	Average Daily Milk Yield (Kg) IARS (1964-65) a	b	NSS (1975-76) a	b	Per Cent Change a	b

cattle units there is one veterinary institution providing health care.

Except in the case of Indo-Swiss project, the achievements and shortcomings of the animal husbandry and dairy development schemes undertaken in the past have not been evaluated so far. The evaluation study of the Indo-Swiss Project done in 1973-74 showed that compared to indigenous breeds, cross-bred cows (1) calve much earlier; (2) calve more frequently; (3) the lactation period lasts longer; (4) produce larger quantities of milk per day and per lactation; and (5) produce this at a lower cost per unit of milk.[16] In this paper we attempt an overall evaluation of the trends in milk production and consumption in Kerala, and of the factors which have contributed to the increased production (especially of the contribution made by the cross-breeding programme). This is followed by a description of the structure of dairying industry in the state. The concluding section discusses certain issues relating to the future strategy of dairy development.

II

Increase in Milk Production

The trend in total milk production in the state can be estimated on the basis of data relating to the average yield per cow, lactation length and proportion of animals in milk, available from surveys conducted in the mid-sixties and mid-seventies.

The Institute of Agricultural Research Statistics (IARS) conducted a sample survey in 1964-65 to collect data pertaining to the yield rates of milch animals and other bovine practices in Kerala.[17] This survey, covering a total of 134 villages and 4,308 households in rural areas, provides data on milk production relating to 4,191 cows and 566 she-buffaloes in milk. The survey used a stratified multistage sample design. The state was divided into a certain number of basic strata, each stratum being roughly equivalent to a district in size. A cluster of two adjoining villages in each stratum was the unit at the primary stage of sampling. At the second and third stages of sampling, the units were a cluster of two households and an animal in milk respectively. Data on milk output and feed input were collected by actual weighing method. The entire survey period of one year was divided into three seasons and data were collected for each season separately.

The second source of data for the mid-seventies is the 30th round of the National Sample Survey (1975-76).[18] A stratified two stage design was used in this survey. The first stage units were the 1971 Census villages in rural areas and urban blocks in urban areas. The second stage units were the households. The survey period of 12 moths was divided into four sub-rounds of three months each. The other main differences between this survey and that of the IARS is that the former relied not on actual weighment but on the respondents' recall of the quantum of output, feed etc. Though the fact that the reference period was a week prior to each visit might have minimised errors in reporting, it would not have eliminated them. For these reasons the estimates from the two surveys are strictly comparable. This limitation should be borne in mind while judging the growth of output calculated on the basis of these two surveys.

According to the IARS Survey (1964-65) the daily milk yield in the rural areas per cow in milk was 1.01 kg and for the she-buffaloes in milk, it was 2.01 kg.[19] In the urban areas, the average yield per cow in milk was 2.31 kg and per she-buffalo 3.15 kg. In 1975-76, in the rural areas, the average daily yield per cow in milk was 1.59 kg and per she-buffalo in milk, it was 2.54 kg. During the same period, the average daily yield per cow in milk was 2.54 kg and per she-buffalo in milk it was 3.79 kg in the urban areas. (See Table 1). This means that the output per cow in milk increased by 60 per cent in the rural areas and by 10 per cent in the urban areas, while that per she-buffalo in milch increased by 26 per cent in the rural areas and by 20 per cent in the urban areas. The increase in yield rate per milch animal is found to have been higher than that per animal in milk. This reflects an increase in the proportion of total adult females which are in milk and is indicative of improvement in the lactation length.

Total milk production in 1964-65, according to the IARS estimates was 2.0 lakh tonnes. In 1975-76, the milk production estimated by the National

TABLE 3: TREND IN PER CAPITA MILK CONSUMPTION

Year	Per Capita Monthly Consumer Expenditure Milk (Rs)		Price of Milk (Rs/kg)		Per Capita Quantity Consumed for 30 Days (kg)		Aggregate Consumption for the Whole Year ('000t)

Sample Survey Organisation was 3.5 lakh tonnes. It is reported in both the surveys that over 85 per cent of the milk produced in the state was contributed by the cows. The estimated number of milch animals was 9.5 lakhs in 1964-65 and 9.8 lakhs in 1975-76.[20] In other words, while the estimated milch animal population increased but marginally, the total milk production increased by 70 per cent. If we apply the yield rates of milch animals obtained from the two surveys to the milch animal population obtained from the Livestock Censuses, the total milk production is seen to become slightly higher than the survey estimates. But the rate of increase does not show any significant difference.

Since the question of comparability of production estimates of the IARS and NSS surveys remains, we have made an alternative estimate based on milk consumption at the two points of time from an independent source, namely, the consumer expenditure surveys conducted by the NSS. These surveys have used uniform concepts and methods of data collection for over two decades and therefore do not suffer from problems of comparability. The published NSS reports give data on the per capita consumption expenditure on milk and milk products as well as the unit price of milk for rural and urban areas, for a number of years. There is adequate evidence to show that the proportion of milk converted into by-products is only marginal in Kerala and that consumption is mainly in the form of liquid milk. Data from the 25th and 28th rounds of the NSS show that in terms of value, the expediture on milk and milk products accounted by milk converted into products is barely 10 per cent in rural areas and 15 per cent in urban areas.[21] It is, therefore, possible to get a fairly good measure of the quantum of milk consumption by dividing the total per capita consumption expenditure on milk and milk products by the unit price of fluid milk, both obtained from the NSS.

The estimates of per capita consumption derived on this basis (Table 3) show that between 1965-66 and 1975-76, per capita liquid milk consumption increased by 40 per cent in rural areas and by 90 per cent in urban areas. Allowing for population increase during the decade, the total milk consumption in the state as a whole is estimated to have risen by 65 per cent. These estimates are fairly consistent with the estimates of change in production obtained from the IARS and the NSS surveys. It is therefore possible to assert with some degree of confidence that there has been a substantial rise in milk production and consumption in Kerala during the past decade.

The increase in total milk production over the years could have been due to (a) rise in total milch animal population and the proportion of animals in milk; (b) increase in the proportion of cross-bred cows in the breedable population; and (c) the rise in the average milk yield of nondescript stock mostly arising from better feeding and management. This may be symbolically expressed as follows:

$$O_{75} - O_{64} = Y_{64} \left(P_{m_{75}} - P_{m_{64}} \right) + \left(Y_{c_{75}} - Y_{i_{64}} \right) \left(P_{mc_{75}} \right) + R,$$

where

O_{75} = milk output in 1975-76.
O_{64} = milk output in 1964-65;
Y_{64} = Yield rates of cows in 1964-65;
$P_{m_{75}}$ = Population of milch cows in 1975-76;
$P_{m_{64}}$ = Population of milch cows in 1964-65;
$Y_{c_{75}}$ = Yield rates of cross-bred cows in 1975-76;
$Y_{i_{64}}$ = Yield rates of indigenous cows in 1964-65;
$P_{mc_{75}}$ = Population of cross-bred cows in 1975-76.
R = effect of increase in yield rates of indigenous cows.

The first term on the right side of the equation gives the effect of the increase in population of milch cows (the population effect) and the second term, the effect of increase in cross-bred population (the breed effect) on the additional milk output. The third term, which is the residual, shows the effect of the increase in productivity (yield effect) of the indigenous cows. In this equation we know the value of all variables except the increase in population of cross-bred cows between 1964-75 and change in their productivity.

Direct estimates of the population of cross-bred cows in the State are not available from any source. But the number of artificial inseminations done by the key village, ICDP and other agencies are available from early 1960s. These data are compiled by the Animal Husbandry Department and is published in the Half Yearly Bulletin on Animal Husban-

dry statistics.[illegible] Upto 1972-73, since inseminations were done free of charge in the AI unit it is likely that the project officials had a tendency to over-report the number of inseminations done, in order to demonstrate their successful performance. With the levy of a nominal fee for inseminations from 1972 and the introduction of the practice of maintaining a record of names and addresses of beneficiaries — records which are subjected to audit — it is believed that the reporting has become more accurate.[illegible]

The fertility rates of artificially inseminated cows are usually assessed under certain assumptions about effectiveness of insemination based on information on the 'non-return' of the inseminated animals for reinsemination within 60 to 90 days. But discussions with the officials involved in this programme revealed that there are no estimates of the total calves born to inseminated cows for the state as a whole. Estimates for particular areas are available but are not based on any uniform procedure; they have been estimated in different areas by different methods, e g pregnancy or actual calving reported. Because of this difficulty, we discussed with persons having first-hand experience for long periods of the working of the cross-breeding programme. Their collective judgment is that the number of calves born as a proportion of total inseminations may be around 20 per cent.[illegible] This information together with the total number of inseminations done in each year provides the basis of our estimate of the number of cross-bred calves born. The size of the cross-bred population reaching the reproductive age in each of the successive years is obtained by applying the age-specific survival rates of all the female cattle in the state. The estimated population of reproductive cross-bred cows in 1975-76 is given in Table 4.

While interpreting the above results the following limitations should be kept in mind; (a) The 20 per cent birth rate, being based on the informed judgment of officials rather than on actual surveys, must be treated with caution, especially because there is no unanimity of opinion on this matter among officials. (b) The age at which the female bovines reach the reproductive age depends on the genetic characteristics of the animal. There is evidence to suggest that the age at first calving for the cross-bred Swiss-brown cows (2.5 to 3 years) is lower than for nondescript cows (around 4.5 years). We have assumed that female cross-bred calves which survive two years after birth will be in the reproductive group. But to the extent that the time required to reach maturity itself is a function of feeding and management of calves, and that farmers in-the-mass may not achieve the standard reached in the areas of intensive development, this estimate may be open to question. (a) In order to estimate the number of cross-bred cows in a certain year, we need to know the age specific survival rates of cross-bred population which in turn requires the age distribution of cross-bred population. But this type of data is not available. The only detailed age distribution data available for female cattle in the state are those obtained from the 30th round of the NSS; these data relate however, to the entire female herd, which includes both cross-bred and nondescript animals. To estimate the total cross-bred population in 1975-76, we applied the age specific survival rate of the entire female herd. Since the productivity of cross-bred animals is significantly higher than that of the nondescript animals, the level of feed input and management may be better for the cross-breds than for the nondescripts and therefore survival rate of the cross-bred also is likely to be higher. In such a situation, application of the combined survival rate may lead to underestimation of the cross-bred population in the productive age. Subject to the above limitations, the number of cross-bred cows in 1975-76 may be placed at 1.3 lakhs accounting for 13 per cent of the total cows in the state.

No data are available on the productivity of cross-bred cows (ie, the value of Yc75) for the state as a whole. But a number of surveys conducted in different parts of the state around the mid-seventies by three independent agencies give information on the daily yield per cross-bred cow in milk and the average yield for the herd.[illegible] Out of the several surveys that conducted by the Indo-Swiss Project (1973-74) provides the most reliable data on the performance of cross-bred animals. This survey gives data on the yield rates of cross-bred cows for the plains, mid-land and high-land both under intensive and average management conditions. In order to obtain a fair idea of the average productivity of cross-bred cows in the state we estimated the weighted yield by pooling data for the different ecologies and also for different classes of producers, the weight being the number of observations in each case. The weighted yield per cross-bred milch cow comes to 1.9 kg of milk per day.

The values of the different variables used in the output decomposition equation are given in Table 5. Solution of this equation shows that the contribution of the increase in milch animal population to the additional milk output is negligible. The two factors mainly responsible for the increase in milk production are increase in the population of cross-bred cows and increase in the productivity of nondescript animals. The contribution of the 'breed effect' to the additional milk output is of the order of 65 thousand tonnes (ie, 50 per cent of the additional output) and that of 'yield effect' is about 64 thousand tonnes. In other words, the 'breed effect' and the 'yield effect' contributed equally to the growth in additional milk output. In order to understand the factors which *stimulated a sizeable improvement in* overall yield, it is necessary to examine the trends in the demand for milk and the profitability of milk production.

The value of O75 and O64 are given thousand tonnes. The productivity of nondescript and cross-bred (ie Yi64 and Yc75) milch cows are given kilogrammes per day. The population of milch animals, *is given* in thousands.

II

Growth in Demand for Milk

The growth in demand for milk generally depends on (a) growth in human population and per capita income and (b) prices of milk and of [illegible].

Milk is the source of two important nutrients in human diet, fat and protein. As a source of fat milk is the main substitute for edible oils. But milk is far less important as a source of fat than it is a source of animal protein. The principal sources of animal protein other than milk (here in after referred as 'other sources') are fish, meat and eggs. In an earlier paper which sought to highlight the inter-state differences in milk consumption we had shown that apart from differences in per capita income, the only other factor which has a significant effect on the inter-state variation in milk consumption is the availability and cost of other sources of animal protein.[26] In regions where protein from other animal sources are more abundant and/or is cheaper than milk protein, the per capita consumption of milk is also found to be lower. The consumption and prices of fat from edible oil have no significant influence on the demand for milk.

Out of the total animal protein intake in Kerala during 1961-62 (the only year for which break up of source-wise consumption of animal protein is available) about 75 per cent was contributed by fish, 10 per cent by milk and the rest by meat and egg. Both in absolute terms and as a proportion of the total animal protein milk is much less important in Kerala than in other states. This is consistent with the fact that the cost of milk protein relative to the cost of proteins from other animal sources was also much higher in Kerala than in other states. (The per capita intake of animal protein for the country as a whole was about 140 grammes (for a period of 30 days) in 1961-62. Out of this 50 per cent was derived from milk and the rest from meat, fish and egg.)

However, over the last decade, there has been substantial change in relative prices of milk and other sources of animal protein, the latter becoming increasingly more expensive than milk (Table 7). We may expect such changes in relative prices to result in a significant shift in the consumption pattern of animal protein in favour of milk. As a matter of fact, the per capita consumption of milk has risen appreciably in the past decade while the per capita intake of other sources of animal protein has recorded a decline. These shifts, however, reflect not only the changes in demand patterns but also those in conditions of supply. In order to assess the relative effect of these two sets of factors, it is useful to form an idea of the likely level and composition of animal protein demand which would have existed, were the given increases in real incomes and population associated with little change in relative prices.

The growth in demand for milk, meat, fish and egg at constant relative prices is estimated for the period 1965-66 to 1975-76 on the basis of the rise in population and per capita demand. The latter is computed from the expenditure elasticities of demand for these items derived from NSS data and the increase in per capita real income in the state taken from official estimates.[27] The projected per capita demand multiplied by the population in the corresponding year gives the aggregate demand.[28] The estimates are presented along with the estimates of supply in Table 8.

The total consumption of meat, fish and egg in Kerala during 1965-66 was 5.6 lakh tonnes. At constant prices, the total demand for these products, given the increase in population and per capita income, would have been 8.9 lakh tonnes by 1975-76. If there were no changes in relative prices, the demand for fish would have risen by 50

per cent [illegible] meat and [illegible].

The p[illegible] at a fast[illegible] general price level, b[illegible] in overall producti[illegible] animal protein (50 per cent fell [illegible] of the rise in demand [illegible] prices (80 per cent). The gap between constant price demand and actual supply, however, varies a great deal between different sources of animal protein. The output of fish for internal consumption, which contributes the bulk of the animal protein intake in Kerala, has been more or less stagnant for the past decade, and has in fact declined in per capita terms despite the steep rise in the price of domestically consumed fish.[19] The tardy supply response of fish output to price rise seems to be due in large part to the prevailing pattern of ownership of means of production and the marketing system which makes it difficult for the traditional sector of the fish economy, which accounts for the bulk of the domestically consumed fish output, to use improved technology to extend their area of operations and income productivity. Although the encouragement of the modern mechanised fishing was intended to improve the productivity of traditional fishermen, in actual fact they have not benefited the latter to any significant extent. Moreover, they have tended to concentrate almost exclusively on prawn fishing. The output of the mechanised sector has indeed risen, and risen substantially, but the bulk of it consists of prawns. The reason for this concentration is that though the returns on domestically consumed fish rose, those on prawns (which are mostly exported) rose much faster. There is also some evidence to suggest that even at the prevailing high price of fish, it may not be profitable for mechanised boats to depend wholly on catching domestically consumed species of fish.

Whatever the reason, the stagnation in the production of fish and increase in its price relative to those of eggs and meat might have induced a shift in the consumption of animal protein in favour of meat and egg. Moreover, the general rise in animal protein prices has induced a stronger supply response in the case of meat and egg than in the case of fish through (i) a higher rate of slaughter, mainly of adult males, and young stock [illegible]; (ii) a sharp rise in the import of [illegible] animals which are mainly meant for slaughter; and (iii) better feeding and management of the poultry birds resulting in an increase in their productivity. The overall increase in meat and egg production during the past decade was nearly 30 per cent. But this is still well below the quantity of constant price demand for these items. Total animal protein supply from fish, meat and eggs, therefore fell considerably short of demand.

In sharp contrast, the supply response of milk to the rise in prices has been very striking. The increase in supply (70 per cent) was actually significantly larger than the projected growth of demand at constant prices. As a result, though the overall shortage in animal protein resulted in a higher than-average rise in milk prices relative to the general price index, the increase in milk prices was much less than that in other animal protein sources, especially fish. The cheapening of milk relative to other animal protein must have resulted in a substitution of the former for the latter. There has evidently been a significant shift in this direction during the past decade. However the fact that the price of different animal protein sources did not change uniformly suggests that they are not perfect substitute for one another.

The impact of the shortages and rising cost of other sources of animal protein relative to milk has naturally not been uniformly felt by all sections of the population. It would appear from the NSS data that the consumption of fish (by far the largest component) has been and remains more widely diffused than that of milk. This can be seen from the concentration ratios (gini co-efficient of consumption) of the two groups presented in Table 9. What is more significant in the context of the present discussion is the markedly different trends in the gini co-efficient over time. Thus the degree of concentration in the consumption of fish, meat and egg seems to have increased in both rural and urban areas, whereas that of milk has fallen apparently. In other words, while the consumption of milk and milk products has become more widespread, that of fish, meat and egg has become more concentrated in the upper income groups. This seems to indicate that the substitution of milk for other animal protein in response to a sharp change in relative prices has occurred largely in the lower income groups.

IV

Increase in Profitability of Milk Production

The relatively strong supply response of milk production to price changes was due to several factors. As pointed out earlier, part of the increase in production has come about as a result of the higher yield per animal which must have been due primarily to the better feeding and management. Over the last decade, the price of milk has risen somewhat faster than the price of feed (especially concentrates). This implies that milk production has become increasingly more profitable. The significant increase in the proportion of cross-breeds is also a cost reducing technological improvement which reinforces the effects of increased price of milk relative to feed.[20] There is further evidence to suggest that faced with growing economic returns to milk and the intensification of population pressure on land people have been progressively reducing their holdings of draught animals and increasing the stock of milch animals.[21] Also, perhaps as a result of better breeding and management, the proportion of dry animals has fallen.[22] That the quality and productivity of milch animal has risen is also corroborated by the rise in price of milch cattle relative to draught cattle (Table 10).

The increase in profitability of milk production over the years also seems to have attracted small cultivators as well as landless rural households to take up dairying as a subsidiary occupation. This is evident from the changes in the size and pattern of bovine holdings by size group of farms during the past decade. A comparison of the data from the 18th and 26th rounds of the NSS shows (a) sharp reduction in the share of draught animals and (b) a corresponding increase in the share of milch animals held by the bottom half of the rural households arranged according to the size of their operational holding. This is quite possible in a situation where there are severe constraints on resource endowment and production is taking place in the smaller size of farms. Since the

Notes: (a) The price of draught animal is for draught animals whose physical condition is good. The price of milch animal is reported for one litre of morning milk yield in (1-3) months lactation. The prices of milk, beef, straw, oilcake, and cotton seed are reported for one kg.

(b) The prices of milch cattle, draught cattle, concentrates and paddy straw are given at constant prices.

2 *National Sample Survey*, 26th round (1971-72), Tables on landholdings, Kerala.

production system is dominated by smaller size of holdings, the rise in profitability of milk production might have resulted in a strong tendency for this group of farms to keep the number of draught animals to the minimum and to increase the number of milch animals so as to take up dairying as a source of supplementary income and employment. Since the availability of feed resources is limited, the increase in number of milch animals reared and the rise in their productivity might have been possible only by releasing feed by reducing the number of draught animals. This is consistent with the strong tendency towards the substitution of milch animals for draught animals in the smaller farms.

It is also clear from Table 11 that the small farmers with little or no land account for a sizeable proportion of the milch animal stock. Thus the bottom 50 per cent of the rural households with an average holding of barely 0.08 acres own 16 per cent of the milch animals and holdings below 0.4 acres account for 45 per cent of the total milch animal stock. At the same time the top 10 per cent of the rural households with an average size of holding of 3.6 acres and accounting for 49 per cent of the operational area own about 19 per cent of the milch animals. About 6 per cent of the milch animals in the state is owned by households who operate no land.

About 35 per cent of the rural households in Kerala own milch animals. Out of the total households owning milch animals, 35 per cent own only one animal and another 38 per cent two animals. Only 27 per cent of the households own three or more animals. Households which own only one milch animal contribute about 29 per cent of the total milk production and their share in the total marketed surplus of milk is about 36 per cent. The households owing two animals each contribute 45 per cent of the total milk production and 52 per cent of the total marketed surplus of milk. The remaining households which own 27 per cent of the milch animals contribute 24 per cent of the total milk production and 19 per cent of the total marketed surplus of milk. This in turn indicates that households who are involved in milk production in the state are essentially producing for the market and the level of commercial milk production (judged by the percentage of marketed surplus of milk to total production) is higher for the smaller producers.

Dairy farming in Kerala is essentially a small scale and widely diffused activity depending largely on purchased (as distinguished from home grown) feed. This dependence is greater in Kerala because the state as a whole depends on imported feed to a much larger extent than other parts of the country. According to the 30th round of the NSS, in 1975-76, about 2.1 lakh tonnes of concentrate feed was used to produce 3.5 lakh tonnes of milk of which only 30 per cent is estimated to have been produced within the state, the remaining being imported.[13] That dairying is a small scale dispersed activity and is becoming increasingly so are very significant facts to be borne in mind while planning for the future. Equally important is the fact that ownership of milch animals seems to have a direct-bearing on the extent of milk consumption.

According to the NSS estimates (1975-76) the per capita annual consumption of milk in Kerala is 15 kg. The monthly household milk consumption (per reporting household) ranges from 6 to 27 kg across different expenditure groups, the corresponding

urban range being from 9 to 25 kg. The percentage of households reporting consumption of milk comes to 50 in rural and 54 in urban areas. The monthly consumption of milk per reporting household in rural areas is 13.3 kg and 20.5 kg in urban areas.

Analysis of the total consumption of milk across different size-classes of population showed that about 60 per cent of the total milk consumption in urban areas and 70 per cent in rural areas are commanded by the top 30 per cent of the population. The share of the top 10 per cent of the population is about 30 per cent.

On an average in rural areas 60 per cent of the milk consumed is home-produced and the rest is purchased. The percentage of purchased milk to total milk consumption is found to decline with rise in expenditure class in rural areas. There is a significant positive correlation (r = 0.85 significant at 0.1 per cent level) between percentage of households reporting milk production and the percentage of households reporting milk consumption in rural areas, but in urban areas the relationship is not significant. In other words, the ownership of milch animals is an important factor which determines milk consumption in rural areas. The quantity of milk consumption is also seen to be positively correlated with the percentage of households reporting ownership of milch animals across different expenditure groups.

V

Future Prospects

The future strategy for milk production in Kerala has to serve two objectives. (a) meeting the rising demand for milk to the growing population, and (b) developing dairying as a source of supplementary income and employment to the weaker sections of the rural population These obviously are also the aims of the new strategy of dairy development However, there is some doubt whether the new strategy can meet both these objectives. In order to understand the problem it would be useful to relate the strategy to the expected growth of demand for milk and evaluate its implications for the size of the herd required to meet it.

Estimates of the growth in demand for all sources of animal protein over the next decade and a half are given in Table 15 They are based on the following assumptions. (a) population growth will decelerate from 2.3 per cent per annum in the last decade to 2 per cent in the coming decade,[34] (b) the rate of growth of per capita income will continue roughly as the same rate as in the past decade[35] (i e, 1.5 per cent per annum) and (c) the income elasticity of demand for milk, fish, meat/egg will be 1.6, 1.3 and 2.2 respectively[36] On the above basis aggregate demand for these products taken together at constant prices will rise from 7.5 lakh tonnes in 1975 to 11.4 lakh tonnes in 1985 and 14 lakh tonnes in 1990. If relative prices were also constant, the demand for milk will rise from 3.5 lakh tonnes in 1975 to 5 lakh tonnes in 1985 and 6.7 lakh tonnes in 1990, accounting for about 47-48 per cent of the total demand for all the products. But since there are severe constraints on the expansion of fish output and since output of meat and egg cannot rise sufficiently to compensate the deficit in fish output it is highly probable that the prices of fish will continue to rise relative to that of milk. Correspondingly, the demand for milk may be expected to rise at a faster rate than the demand estimate made under constant relative prices. In the absence of reliable estimates of the responsiveness of milk demand to changes in the relative prices and, more importantly, because of the difficulties in evaluating the relative price elasticities and cost trends of different animal products in the future, we have assumed that the share of milk demand in total animal products will increase by 10 percentage points in the next fifteen years which is roughly the rate of change which occurred between 1965 and 1975. This means that the requirement of milk will be 6 lakh tonnes by 1985 and 8 lakh tonnes by 1990. A major task of the cattle development programme is to increase milk output by 4.8 lakh tonnes between 1975 and 1990.

The eight lakh tonnes of milk that may be required by 1990 can be obtained by adopting a combination of the following strategies (a) by increasing the size of the milch animal herd. (b) by increasing the proportion of cross-bred animals to the total milch stock in a planned and phased manner, and (c) increase in average yield per animal The strategy of the state programme has so far rested heavily on (b). But in order to get a proper appreciation of the relative emphasis to be given to the different elements it is necessary to consider their ultimate impact For this purpose we will first evaluate the increase in production which can be obtained on the basis of the expected rate of growth of total milch animal stock.

On the basis of the IARS and the NSS Surveys the estimated number of milch stock in 1965 was 9.5 lakh and by 1975 it increased to 9.8 lakh or barely 0.3 per cent increase per annum[37] Assuming that this rate will continue in the future the estimated population of milch animals will be around 10.3 lakhs in 1990. Out of this, let us assume that the proportion of she-buffaloes will be 10 per cent and their contribution to total milk output will remain at 70,000 tonnes. This is not an unrealistic assumption because very little is being done to upgrade the buffaloes This implies that the total stock of milch cows in 1990 will be around 9.3 lakh and they will need

2 and 3 John Kurien, *op cit.*

to produce 7.3 lakh tonnes of milk or an increase of 4.5 lakh tonnes.

As regards the breeding programme we have two alternatives: (a) maintaining the pace of the cross-breeding programme at such a rate as to sustain the current annual rate of addition to productive cross-bred cows during the next 10-15 years; and (b) accelerating the pace of the cross-breeding programme so that by 1990 the entire nondescript stock is replaced by cross breeds. If we proceed with alternative (a) by 1990 there will be 3,20,000 cross bred cows in the state. Assuming that 60 per cent of the cross-bred animals are in milk, the number of productive cross-breds in 1990 will be 1 92,000. The population of nondescripts will be 6,07,000 of which (around 53 per cent in milk) cows in milk will be 3,21,000. If the average output per nondescript and cross-bred cows in milk are maintained at the present level (namely 0.52 tonnes and 1 12 tonnes per annum respectively) the total milk production by 1990 (including buffaloes milk) will be only 4 3 lakh tonnes against the estimated demand of 7.4 lakh tonnes and 6 lakh tonnes respectively. In other words, the implementation of the cross-breeding programme at the current level cannot meet the milk requirement of the state unless there is a further all-round increase in yield per animal. Even if the entire nondescript herd could be replaced by 1990 with improved cross-bred animals, production at the current levels of yield per animal will be substantially larger (6.4 lakh tonnes) but still short of requirement. However, if the cross-breeding programme could be accelerated and made more effective so as to upgrade the entire stock by 1985, the requirement for that year will be met without improvement in yield, but there will still be shortage by 1990.

It should be noted that this rate of acceleration in upgrading depends not only on achieving the target rate of insemination (4 lakh per annum) but a near doubling of the conception rate. Whether and under what conditions this is feasible will need to be carefully examined. It would seem that there are quite difficult organisational and extension problems, especially in the plains and the midlands where much of the cattle is located, to be overcome before significant increase in the coverage and efficiency of artificial insemination can be achieved. It would, therefore, be prudent to be cautious in projecting the rate at which cross-bred stock can be expanded. Also what we need is not so much an expansion of the scale of the artificial insemination programme, as much greater attention to the improvement of its efficiency. In any event, the programme for upgrading *breeds is unlikely in the foreseeable future to bring about a reduction of the milch herd needed to meet the milk requirements.*

Assuming that alternative II is closer to the limit of feasibility (as far as the expected number of cross-breds are concerned), it is clear that the projected requirement of milk cannot be met unless there is a substantial increase in the productivity per animal. One way of doing this would be to increase the ratio of animals in milk to total milch animal stock. We do not know enough about the extent to which this can be done in the conditions (ecological and social) prevailing in Kerala. This aspect of the problem deserves much greater attention. In any case it should be noted that even in countries with a sophisticated dairying industry the proportion seldom exceeds 70 per cent. Therefore it seems that the primary source of increasing yield will have to be on better feeding and management.

The future availability of feeds and fodder at least at the present level of its cost is an important condition that is necessary for realising the increases in production of the order visualised. The cost of milk production is higher in Kerala than in any part of India mainly due to high cost of feed. At present about 60 per cent of the cost of milk production is accounted for by concentrates which are the main source of digestible crude (DCP) in milk production.[28] As we had seen earlier, out of the total quantity of concentrates used for milk production in 1975-76 about 76 per cent was imported from other states and the rest was produced in the state itself. There are two aspects to this problem; enhancing physical supplies of the required quantity and the cost of the feed. The main source of concentrate feed in Kerala are coconut cake, rubber-seed cake and rice bran. The average annual production of coconut oilcake in Kerala is about 50 thousand tonnes. Out of this 15 per cent directly goes into milk production. The remaining quantity is marketed to other states and part of it is again imported to Kerala in the form of compounded feed. According to the estimates on rubber seed production, it is seem that about 37 thousand tonnes of cake can be obtained from this source. This source remains completely untapped. The annual availability of rice bran is estimated to be around 75 thousand tonnes which is already fully utilised as an animal feed.

If all the available sources are fully tapped, the total supply of concentrate feeds from indigenous sources will be only 1.5 lakh tonnes. Even allowing

for possible increases due to higher output of coconut and rice the quantity may not exceed two lakh tonnes. This will be inadequate to meet the DCP requirements of growing youngstock dry animals and draught bullocks, estimated at 2.25 lakh tonnes.[39] It is clear, therefore, that even if we fully utilise all the local resources currently available, there will be a large deficit in relation to the demand for concentrates for all categories of cattle and buffaloes.

During 1975-76, in order to produce 1 kg of cow milk 0.556 kg of concentrate feed was used in the state; the corresponding concentrate required for she-buffaloes was 0.919 kg.[40] If we assume that the composition of concentrate feed will not undergo any significant change in the coming decade, then the total demand for concentrate feeds to produce the expected level of milk output by 1985 will be 3.85 lakh tonnes and by 1990, 4.75 lakh tonnes. The state at present imports at least 1.5 lakh tonnes of concentrates and produces 10,000 tonnes of compounded feed.[41] The realisation of milk production target will then require a manifold increase in feed supplies either by import of concentrate feed, or expansion of local production of compounded feed with raw materials imported from other states or accelerating the internal production of crops (like berseem, linseed, etc.) which are a source of protein. Whether or not imports on this scale are feasible and at reasonable cost is however difficult to judge, because the intensive cattle-development activities in other states will also generate larger demand.[42] If the overall supply of concentrate feeds in the country as a whole does not meet the growing demand, the resulting shortage will necessarily raise feed prices and this in turn would adversely affect the profitability of milk production and hence the incentives for expansion of output on the required scale.

In this context, the following aspects need to be examined carefully: (1) How does the cost of concentrate feed (per unit of DCP) in Kerala compare with that in other states? (2) Is it possible and, if so, by what means to keep down the cost per unit of DCP to the minimum? (This would include search for alternative sources of DCP which are less bulky and can be converted more efficiently by the animal.) (3) What are the possibilities of, and the impediments to, the expansion of new crops (like barseam) with a large protein content within Kerala? The last mentioned aspect has received some attention in the state programme but has not shown any striking results. It is to be mentioned in this context that the diversion of more land for the production of fodder within the state, which is already faced with a severe land constraint, presents difficulties as the competition for land for producing human food is acute. Also, even if protein rich fodder could be increased, it is unlikely to benefit the very substantial number of small farmers and landless people who are involved in milk production. For them economic attraction of milk production will depend not only on the relative prices of milk and feed but more importantly on their ability to secure the necessary feed supplies from the market at reasonable prices. An effective organisation for procurement and distribution of feed at reasonable prices is critical for their survival and growth. In this context, a close link between, and integration of, milk co-operatives with food production and distribution can play a major role.

VII

Conclusion

As part of the national strategy for augmenting milk production cross-breeding and upgrading of milch animals have been taking place in Kerala during the last two decades. This programme was moving at a slow pace in the 1950s and 1960s; but in the 1970s, it has attained more importance and there has been considerable effort to improve the coverage and efficiency of this programme. In this paper we have made an attempt to examine the contribution of animal husbandry and dairy development programme to the increase in milk production and to explore the future prospects for augmenting milk production in Kerala. The following are our main findings :

(1) There was considerable increase in productivity of milch animals and total milk production in Kerala. The rise in milk production was partly due to increase in cross-bred population, but largely to the increase in level of feed input of milch animals.

(2) The profitability of milk production has gone up over the years. This was due to (a) the expansion in the size of the market for milk created by the increase in population and per capita income and the shortage in production of other sources of animal protein especially fish; and (b) the new cost-reducing technology in milk production. This, along with the pressures created by lack of alternative employment, has stimulated the smaller size rural households to take up dairying on an increasing scale as a source of subsidiary occupation.

(3) Milk production in Kerala is mainly undertaken by small and marginal farmers and agricultural labourers. More than 40 per cent of the households own only one milch animal and about 35 per cent own 2 animals each and bulk of the total milk production and marketed surplus of milk is contributed by this class of producers. The ownership of milch animals is seen to be an important factor which determines milk

consumption in rural areas. The consumption of milk is highly concentrated in the upper income groups. For 50 per cent of the households in Kerala milk is an important source of animal protein. All this underlines the necessity to give a pronounced small-farmer focus to the state's diary programme.

Keeping in mind the factors underlying the growth in milk production and the technical relationship between production and consumption of milk, we have tried to estimate the future prospects for milk production in Kerala. It is seen that the demand for milk will increase to 6 lakh tonnes by 1985 and 8 lakh tonnes by 1990. While intensive cross-breeding programme aimed at replacing the entire indegenous milch stock with improved breeds by 1990 and, if possible, earlier is desirable, it is likely to encounter several difficulties and in any case cannot by itself increase output to the desired extent. The main bottleneck for increasing milk production in Kerala in the coming decade will be the shortage of feeds especially concentrates for which the state has to heavily depend on import. Massive production of compounded feed by using domestically available resources like dry matter and internally produced as well as imported concentrates as the main source of digestible crude protein will help to reduce the degree of dependence on imported feed. Along with this, attempts should be also made to undertake a fodder production programme especially as intercrop in gardenlands. All this, combined with a viable organisation which can mobilise the small rural producers for the efficient marketing and distribution of milk and ensure them the suply of feed inputs at economic prices, will help a great deal in improving the employment and income of the weaker sections of the rural population in Kerala.

The future prospects of milk production depend to a great extent also on the strategy of cattle slaughter. In the past there has been no ban on cattle slaughter in the state and this in turn has helped in the elimination of unproductive animals and contributed to the rise in overall supply of animal protein. With the growth in cross-bred cattle population the economic rationale of an increasing rate of cattle slaughter would become stronger in the coming years, essentially because of the higher calving rate of the cross-bred stock whose age of maturity and dry period is lower than those of non-descript cows. The higher calving rate of the cross-bred population is likely to lead to an increase in the rate of growth of cattle population in the future.

TABLE A

State	Year	Proportion of Animals in Milk		Average Daily Milk Yield Per Animal in Milk (kg)	
		Cows	She-Buffaloes	Cows	She-Buffaloes
Andhra Pradesh	1966-67	38	52	0.79	1.40
Bihar	1965-66	48	51	1.23	3.14
Gujarat	1963-64	46	61	1.67	3.08
Kerala	1964-65	45	59	1.11	2.01
Madhya Pradesh	1966-67	35	40	0.51	1.77

Source: Daroga Singh, *et al* "Monograph on Estimation of Milk Production", Institute of Agricultural Research Statistics ICAR, New Delhi (undated).

Since the state's economy might find it extremely difficult to support a stock of cattle larger than at present, it is essential to have a deliberate slaughter policy for the elimination of excess male and unproductive female cattle in order to control their stock and reduce the pressure on scarce feed resources There is also need to establish a network of modern slaughter houses in the urban and rural areas for ensuring efficient and hygienic utilisation of the meat and other byproducts from the slaughtered animals. It may also be mentioned in this context that the recent demand for banning cow slaughter in Kerala made by some national leaders has no economic rationale behind it. Any ban on cow slaughter in the state would be totally harmful to the growth of the livestock economy, further it is sure to affect adversely the several development projects already undertaken.

Notes

[This paper has been prepared as part of a larger study on "The Aspects of the Bovine Economy of South India" financed by the Indian Council of Social Science Research (ICSSR). The author is grateful to A Vaidyanathan, for his valuable guidance in the preparation of this paper, to K N Raj, N Krishnaji and T N Krishnan for valuable comments on an earlier draft; to M N Menon of the National Dairy Development Board for his technical advice; to the Kerala Livestock Development and Milk Marketing Board and the Bureau of Economics and Statistics of the Kerala government for generous help in providing data]

1 Out of the 3 million bovines reported in the 1972 livestock Census 2.9 million are cattle and the rest are buffaloes. An idea of the differences in the level of productivity of milch animals in Kerala a few other regions in India can be had from Table A.

2 Around 0.5 per cent of the net sown area is under permanent pastures and grazing land and 35 per cent of the total cropped area is under-paddy. The effect of population growth, ecology and cropping pattern on livestock holdings in Kerala is discussed in a forthcoming paper.

3 See for instance, Ward and Corner, "Geographical and Statistical Memoir of the Survey of Travancore and Cochin States, 1816-1820", Surveyor General's Office, Madras, December 1827, Travancore Circar Press, 1863.

4 Reviewing the cattle wealth of Travancore and the attempts to improve it, the Travancore State Manual says; "The improvement of cattle is a vital problem in Travancore. Agricultural presperity depends to a great extent on the betterment and efficiency of cattle. The cattle problem turns around a vicious circle of want of good feed and good breed. Even at the time of the survey of Ward and Corner, the cattle were small in stature. The climatic conditions are unfavourable for the rearing of good cattle. The heavy rainfall and the comparative poverty and insufficiency of pasture lands are particularly unsuited to the breeding of good cattle. Though the country gets both the monsoons and there is an abundance of pasture during the sowing season, the fact that the rains are not spread throughout the year creates a dry season, when it is not possible to raise any kind of pasture. During the rains season the rains pour so heavily and continuously that it is not possible for the cattle to graze in the open: thus feeding is a difficult problem in dry and wet seasons. The stock is also very poor. The degeneration of the domestic cattle is due to promiscuous mating and improper and insufficient feeding. The agricultural department therefore experimented with bulls from adjoining British Indian States, Ongole, the Kangayam and Amrit Mahals are among the first batch

of foreign breeds to be tried. The results were not satisfactory. Bulls from the upper Indian breeds like the Sindhi as well as English breeds were then imported and tested. The Sindhi breed was found to adapt itself to local conditions. Efforts were therefore made to popularise the Sindhi cattle. Herds of selected bulls and cows were imported from Karachi and maintained at the Government farms. Calves born to them were weaned and were sold generally in pairs to individuals and institutions interested in cattle breeding. Complete extermination of the whole stock of local cattle was not possible. It was therefore thought that more extensive results could be obtained quickly and cheaply though less perfectly by grading up the local cows with bulls of superior "strains". See, T K Velu Pillai, "Travancore State Manual Part III" Economic Conditions, Chapter 4, Agriculture.

5 At the end of the First Plan there were only one veterinary hospital and nine dispensaries in the state.

6 Planning and Development Department, Government of Kerala, "Third Five Year Plan, Draft Outline", 1960, p 112.

7 'Formulation of Five Year Plan (1978-83)', Background Paper, "Livestock Development", Agriculture division, State Planning Board, Trivandrum, 1977 (mimeo).

8 The Key Village Scheme introduced during the First Five Year Plan was intended for the multiplication of superior germplasm from the established farms in selected breeding tracts by providing simultaneous attention to better feeding, improved breeding and effective disease control, scientific management practices and organised marketing facilities. However, since even after one and half decades of operation it failed to create any notable impact, a new scheme called Intensive Cattle Development Project (ICDP) was launched towards the end of the Third Plan. This was designed to improve the genetic potential of cows by artificial insemination in tracts which form the milkshed areas of large dairy plants with a view to enable the dairy plants to collect and process the milk upto the installed capacities. For a detailed discussion of the achievements and shortcomings of these schemes see Government of India, Ministry of Agriculture and Irrigation, "Report of the National Commission on Agriculture" (1976), Part VII, Animal Husbandry.

9 The Indo-Swiss Project and part of the Animal Husbandry and Dairy Development Department were combined and a new organisation called the Kerala State Livestock Development and Milk Marketing Board was formed in 1976. This organisation is currently responsible for the overall dairy development and milk marketing in Kerala.

10 One important breakthrough in animal production technology was the successful attempt made in the western countries in deep freezing bovine semen using liquid nitrogen as the safe refrigerent. This made large scale field application of artificial insemination in cattle breeding possible. Organised field application of frozen semen was intro-

[illegible] Kerala in 1965.

11 Under the self-employment programme, these inseminators are authorised to charge five rupees per insemination as their fee. The necessary equipment and semen for insemination are provided by the department of dairy development and other related agencies.

12 Currently there are three bull stations and three semen banks functioning in the state.

13 According to the data furnished by the department of dairy development, about 150 dairy co-operatives were supplying an average 200 litres of milk per day to the chilling plants. The remaining societies were practically inactive and were supplying only 50 litres per day.

14 Data relate to December 1977. These plants are on the average currently operating at 40 per cent below their installed capacity.

15 Government of Kerala, Department of Animal Husbandry, "Bulletin of Animal Husbandry Statistics", July-December, 1976.

16 The average dairy milk yield of Brown-Swiss cross-bred, nondescript and graded milch cows in three extension centres of the project surveyed for the evaluation study are given in Table B.

17 Institute of Agricultural Research Statistics (ICAR) "Estimation of Milk Production and other bovine and goat practices in Kerala" (1964-65), New Delhi, (Mimeo) undated

18 Government of India, Department of Statistics, National Sample Survey, Report No 281/3, 30th round (July 1975-June 1976), "Some Estimates of the Production of Livestock Products and Related Characteristics, Kerala", March 1978, New Delhi.

19 Considerable variation in the yield levels of cows and she-buffaloes are observed between rural and urban as well as between northern and southern regions of the state. The factors responsible for this variations will be studied in a separate paper.

20 The increase in milch animal population between 1966-1972 was, according to the Livestock Census data 7.5 per cent. The rate of increase in the estimated milch animal population between 1965 and 1975 by the NSS and the IARS surveys was only 4.5 per cent. While the milch animal population estimated from the IARS and NSS surveys includes only dry and animals in milk, the population reported in the Livestock Census includes other categories such as heifers.

21 The average per capita expenditure on milk and milk products was supplied separately for the 26th and 28th rounds of the NSS from the state sample estimates. The average rural and urban prices of milk were also obtained from the state sample data for different rounds.

22 Government of Kerala, Department of Animal Husbandry, "Bulletin of Animal Husbandry Statistics". Data on the number of artificial insemination are available from 1964-65 in this half yearly publication.

23 A fee of five rupees per insemination is charged from 1972-73 onwards.

24 We have analysed the data pertaining to the number of inseminations done in 1975 and the number of calves born in 1976 from 12 artificial insemination centres in the state located in the four southern divisions. The conception rate is seen to vary between 19 to 27 per cent. In two of the insemination centres located in the High Ranges the conception rate was near to 27 per cent.

25 One of these surveys is the evaluation study of the Indo-Swiss Project. The second is a pilot survey conducted by the National Dairy Development Board. See for details: (a) "Economics of Cross-Bred Cattle" *op cit*, (b) "Dairy Development Projects for the districts of Trivandrum, Quilon, and Alleppey, Kerala", National Dairy Development Board, Anand, 1976.

26 See K N nair and A Vaidyanathan, "Inter-State differences in Milk Consumption in India, A Preliminary Analysis", Working Paper No 62, Centre for Development Studies, Trivandrum.

27 The estimates of per capita income in Kerala suffer from two major shortcomings: (a) they do not take into account the remittances of money from outside the state; (b) the export price of the commodities was moving at a faster rate than the general price level in the last one and a half decades and so the actual export income obtained may be much higher than what has been accounted in the state income estimates. These in turn must have led to underestimation of the per capita income and thus the estimated rates of growth in demand for milk and fish are likely to be lower than the actual rate of growth.

28 The per capita demand for milk and other items is estimated using the following method: $Pt = Po \; 1 + \left(\frac{It - Io}{Io}\right)^b$ where Pt = per capita demand in the t^{th} year, Po = base year consumption, Io = base year per capita income, and b = expenditure elasticity of demand. The expenditure elasticities of fish, meat and egg are obtained from the 17th round of the NSS and that of milk is estimated from 16th to 20th rounds. The estimated expenditure elasticity of demand for milk is 1.6, fish 1.3 and meat and egg 2.2.

29 For a detailed discussion of the trend in supply and consumption of fish and the functioning of the fish economy of Kerala, see John Kurien: "Towards an Understanding of the Fish Economy of Kerala: A Preliminary Study of the Current Situation and Trends in Organisation of Technology Production and Distribution of Incomes", Working Paper No 68, Centre for Development Studies, Trivandrum.

30 "Economics of Cross-Bred Cattle", *op cit.*

31 For a detailed discussion of the size and utilisation of draught animals and the factors responsible for the substitution of draught animals by milch animals, see K N Nair, 'Size and Utilisation of draught Animals in Kerala'; *Indian Journal of Agricultural Economics*, October-December 1977.

32 The overall breeding efficiency (defined as the percentage of cows in milk to total milch stock used for breeding and milk production) of cows in Kerala increased from 45 per cent in 1965 to 55 per cent in 1975.

33 Out of the total concentrate feed used in milk production in 1975-76, about 30 per cent was in the form of compounded feed. The break of the composition of the concentrate feed in milk production is given below:

Source of concentrate feed	Quantity used ('000 t)	As per cent of total
Compounded feed	62.00	29.5
Oilcake	48.00	22.8
Coconut oilcake	8.00	3.9
Rice bran, husk and other items	39.00	20.5
Total	210.00	100.00

Source: National Sample Survey, 30th round (1975-76). The data are obtained from the state tabulation.

34 Available evidence suggests a decline in birth rate in Kerala during the last decade. See, T N Krishnan, 'Demographic Transition in Kerala', *EPW*, Annual Number, 1976.

35 Note 27.

36 Note 28.

37 The annual growth rate in the population of milch animals as estimated from the Livestock Census data is about 0.4 per cent.

38 "Economics of Cross-Bred Cattle", *op cit.*

39 The estimate of concentrate requirements for the bovine stock other than animals in milk) are obtained by standardising the young stock into adult units and then assuming that the quantity of DCP required for the growing young stock and dry animals will be 150 grams per day and that of work animals will be 200 grams per day (assuming 90 working days in a year)

40 NSS Draft Report, 281/3.

41 The import estimate of 1.5 lakh tonnes is based on the total consumption of concentrate in milk production (1975-76) as obtained from the NSS data.

42 The second phase of the Operation Flood which is the largest effort to be made in the country for increasing milk production was launched on July 1, 1978 by the Government of India. This scheme covers all the states in the country and involves an investment of the order of Rs 500 crores. The scheme is expected to help 10 million rural households in augmenting their milk production.

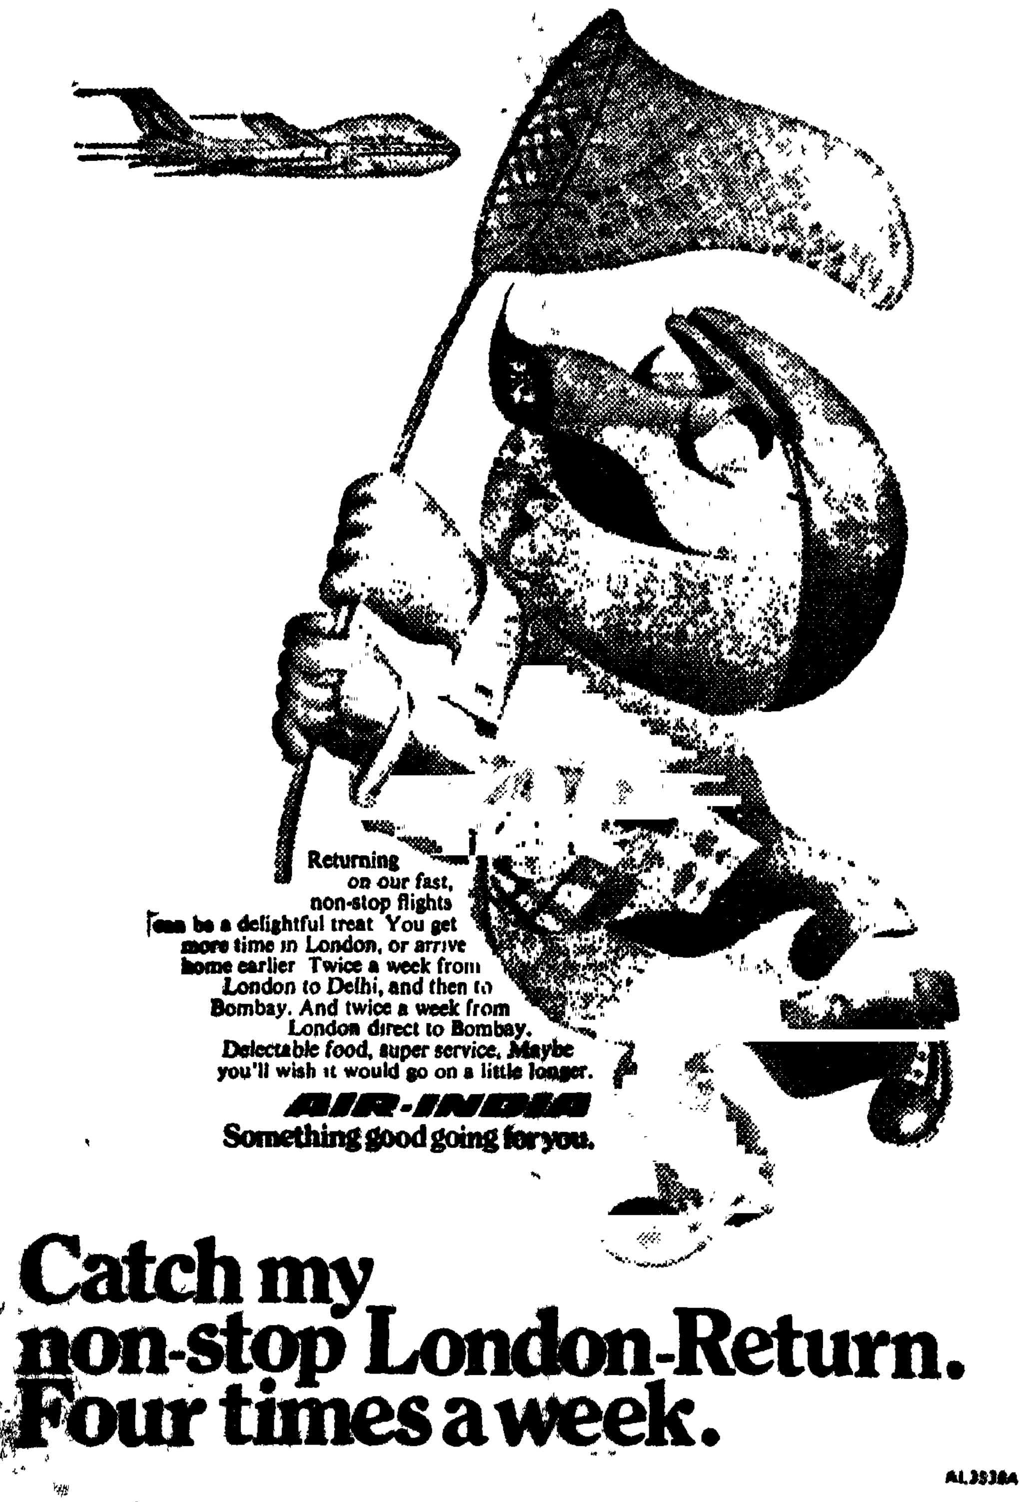
Beyond the Emergency

Mary Tyler

Reason Wounded: An Experience of India's Emergency by Primila Lewis; Vikas Publishing House, 1978; pp vi + 207, Rs 45.

IT is well known that Indian governments were adept at putting political opponents behind bars long before the declaration of Emergency in June 1975; and that the main difference thereafter was of degree rather than substance. But the Emergency provided a cover for corrupt politicians and bureaucrats up and down the country arbitrarily to remove from circulation 'awkward' people like Primila Lewis, who could not be classified as political opponents but had had the temerity to be troublesome to the powers-that-be.

Primila Lewis did not belong to any political party, nor had she taken part in any of the mass movements of the early seventies. The supreme irony of her imprisonment under the Maintenance of Internal Security Act from July 1975 till January 1977 lay in the fact that the trade union activities which had led to her detention had been aimed solely at enforcing laws made by the Congress government itself, allegedly in the interests of the poor and oppressed. While Primila Lewis was behind bars that very same government announced a 20-point programme which contained many of the things which she and her colleagues in the Mehrauli Agricultural Workers' Union had been fighting for. And yet the Union had been brutally suppressed



Primila Lewis and her English husband rented a farm in Mehrauli tehsil south of Delhi, in 1971, and very soon after she found out that they had come to a very special area: it had been selected by some of the mightiest in the land for their 'model farms' (and no wonder: they had generously been provided with cheap land, irrigation, transport and other facilities by the beneficent Delhi Development Authority, after it had bought the land at low prices from its original peasant owners). The Lewis' neighbours included senior diplomats, civil servants and military officers, top industrialists and politicians — including none other than Indira Gandhi herself — all taking advantage of the tax-free income on agriculture by investing in these profitable enterprises. In Primila Lewis' words: "These people were all civilised, highly educated pillars of our society. Not all of them were VIPs, but all of them were part of the modern, western-educated elite .".

However, when it came to their farmworkers, these chiefly absentee landlords were not so modern. Their farms were efficient; crops flourished, roses were grown and racehorses trained for export. But the people who produced their profits for them were little more than twentieth-century slaves; body and soul were at the disposal of the modern slaveowners, the gentry of Mehrauli. Labour legislation played no part in the relationship between employer and employed: the minimum wages act and laws about leave, compensation, sick pay, etc, were flagrantly disregarded by the employers, many of them stalwart supporters of the very government which had introduced the legislation.

"Impelled by common sense and sheer natural justice" (as well as sincerity and a good deal of courage), Primila Lewis, eschewing the company of the landowners whom one might have considered her natural allies, chose to side with the exploited farmworkers. After some experience of trying to put right some of the blatant injustices which she came across, realising that individual, unco-ordinated efforts were not enough, she helped to organise the Mehrauli Agricultural Labourers' Union. Oddly enough, in view of subsequent events, the formation of a union was assisted and encouraged by the Registrar of Trade Unions (perhaps because the authorities expected a 'tame' union to behave tamely?). By thus becoming involved with the farmworkers' problems, by finding out about rules and regulations and trying to make people aware of their rights, Primila Lewis unwrittingly developed into a threat to the local gentry. She had quite genuinely (though somewhat naively) not foreseen this. On the contrary, "We believed that our work would be appreciated not only by the government but also by the gentry on the farms. we were sure they would be responsive once they understood our work".

Responsive they were: but not in the way Primila Lewis had anticipated. "It was a revelation of the elite of our country to witness their reaction to the mere suggestion that they implement the minimum labour legislation on their farms. They reacted to the very idea that their employees had any such thing as rights. . there was no hint in any one of them of the remotest democratic consciousness, and yet these were our most 'modern' gentry. It was a shocking disappointment to realise how thin was the veneer of our de macracy".

In what I found to be the most valuable part of this book, Primila Lewis gives a detailed account of the farmworkers' struggles, providing a clear illustration of the hollowness of Congress populist 'socialism'. The poor are supposed to be soothed by laws, slogans and promises — but should, apparently, never take them seriously. The exploited migrant labourers of Mehrauli, for the most parts 'purabias' driven by poverty from their village homes in Bihar and eastern Uttar Pradesh, living always in fear of dismissal and total destitution, were understandably reluctant at first to risk everything by joining together against their 'maliks', but gradually became bolder and more adamant in their demands as they realised the potential strength in unity and organisation. As the union

rew stronger, so did the employers' malicious determination to stamp it out at all costs. And step by step, through bitter experience, Primila Lewis came to know that it was not ignorance and apathy on the part of the workers, nor subversion by its opponents, which was preventing the government from helping the poor and oppressed; on the contrary, it was the government itself which, through police, judiciary and bureaucracy (with few notable exception), was supporting these elements which blocked the path to progress at every turn. The union's lawful demands were met with threats, intimidation, cunning and trickery, with false implication in legal cases and ultimately with arrests and physical force. This section of Primila Lewis' account ends when she herself is beaten up and has several ribs broken by local bullies. By then her initial trust in the 'law', its makers and upholders is well on the way to evaporating:

> the realisation came to me that justice a fair chance, a fair hearing, a fair anything was not for the poor and oppressed. And those like myself, once we declared ourselves unequivocally on the side of the poor, would be treated just like them. Well,, it was just as well to know this and to have no illusions on that score. Rights? We had no rights. Laws? There were only paper laws for the people, meant to create an image of justice and equality. Try to implement them and you would soon discover the real intention of the lawmakers. So what alternative was there?

Unfortunately, Primila Lewis was not given the chance to find an alternative: the Emergency was declared and she and most of the other union leaders were arrested (even the fact that they had recently affiliated to the CPI-led AITUC did not protect them). She puts her own arrest down to the fact that she had antagonised some of the most powerful people in India, i e, Indira Gandhi and certain of her henchmen. But Mehrauli was in essence no different from anywhere else; and wherever Primila Lewis might have worked as militantly against the interests of landowners, she would inevitably have come to clashes with them sooner or later. Though the Eemergency undoubtedly gave a lot of people the opportunity of exercising personal vendettas, the basic struggle in Mehrauli was a class struggle.

The latter part of "Reason Wounded" deals with the author's prison experience in Ambala and Hissar jails in Harvana. Apart from a couple of other political detenus (from the Jan Sangh), the inhabitants of the female wards in the jails were mainly from the poorest and most deprived sections of the population. Primila Lewis concentrates mainly on the struggle which she helped them to wage against the officer in charge of the female ward at Ambala, one Phul Kumari Singh, sister-in-law to Bansi Lal, then Chief Minister of Haryana and one of Indira Gandhi's Emergency vizirs. The female section at Ambala was Phul Kumari Singh's personal domain. Powerful connections ensured that her vicious nature could express itself unhindered in cheating, tyrannising and beating the poor women prisoners in her charge. Even by the abysmal standards of Indian prisons, the regime in Ambala (later transferred to Hissar) was exceptionally brutish as far as the ordinary prisoners were concerned. Beaten and sometimes raped by the police who arrested them, the women found the haven of prison walls only to be subjected to further violence, abuse and victimisation at the hands of Phul Kumari Singh, who made them work their fingers to the bone, cheated them of their dues and played off one against the other to ensure that there was continuous dissension among prisoners, to her own advantage.

Once more, by showing an 'unhealthy' interest in rules and their implementation, Primila Lewis found herself branded as a subversive and an inciter of other prisoners. Furthermore, she was faced with setbacks in her attempts to forge unity among the prisoners themselves; organisation within jail walls was quite a different proposition from union struggles outside. She was still thinking about how to overcome these problems when she was released as a result of the efforts of her husband and friends. Soon after that the Emergency was, abruptly, over.

Despite its title, this is not an 'Emergency' book. The oppression of workers in Mehrauli and jail tyranny in Ambala and elsewhere did not start with the Emergency; nor did they end in March 1977. The development of the author's own political understanding of such facts is a very important feature of "Reason Wounded", and a hopeful one.

Who Benefits from the Planning Commission?

Anand P Gupta

Distribution of Benefits from Government Expenditure: A Case Study in Selected Districts by S P Ahuja; The Institute of Economic and Market Research, New Delhi, 1978; pp xi + 164, Rs 50.

ONE thing emerges very clearly from a survey of the Indian scene. This relates to the growth of government. The total receipts from taxes levied by the Government of India and by the various State and Union Territory governments in the country have grown from Rs 626.67 crores in 1950-51, Rs 1350.41 crores in 1960-61 and Rs 4752.41 crores in 1970-71 to Rs 14612.66 crores in 1978-79 (budget estimates). As a proportion of national income, they have grown from 6.6 per cent in 1950-51, 10.2 per cent in 1960-61 and 13.8 per cent in 1970-71, to about 20 per cent in 1978-79. Government expenditures have also grown. They have grown from 9.6 per cent of national income in 1950-51, 19.5 per cent in 1960-61, 23.4 per cent in 1970-71, to over 35 per cent in 1978-79.

But the question is, growth of government for what? Has the growth of government been of any meaningful help in abolishing poverty? Has the growth of government been of any help in increasing the labour intensity of output and thus in reducing the incidence of under-employment and unemployment in the country? Has the growth of government been of any help in reducing gross disparities in the distribution of wealth, incomes and consumption expenditures?

These are legitimate questions. S P Ahuja has in the book under review, which reports the results of a study financed by the Planning Commission, attempted to deal with an important part of the last question. He says that the distribution of benefits from government expenditures is such that while the incomes of the rich households (with monthly incomes of over Rs 1,000) go up five to seven per cent, those of the poor households (with monthly incomes of less than Rs 100) go up by approximately 20 per cent. Considering that the incidence of taxation on the poor is substantially less

than 20 per cent,* this means that the fiscal system in India is working in the direction of reducing inequalities in the distribution of incomes.

This is good news. But if one goes through the details of Ahuja's work, one finds that it suffers from certain shortcomings. The first shortcoming of Ahuja's work relates to his coverage of government expenditures. He has dealt with only those government expenditures which were incurred through the district treasuries in districts of Gaya, Kanpur and Thanjavur. Such expenditures amounted to Rs 91.42 crores in 1974-75, the reference year selected by Ahuja for the study. This is considerably smaller than the total government expenditures incurred in the districts of Gaya, Kanpur and Thanjavur in 1974-75. If one works out the relevant details, it would appear that the government expenditures covered by Ahuja do not amount to even 40 per cent of the relevant total government expenditures. It may be noted that the list of government expenditures not covered by Ahuja includes the various subsidies. To the extent to which the real beneficiaries of government subsidies belong to the richer strata of society, the redistributive effects of subsidies may be just the opposite of what they are intended to be.

Anothar shortcoming of Ahuja's work relates to his crucial assumption that government expenditure benefits those for whom it is primarily intended. According to him, government expenditure on, say, education benefits students and in turn the households to which the students belong. He takes no notice of leakages in government expenditure on education. He makes no distinction between the utility derived by different households from government expenditure on education. He is not concerned with the relevance or otherwise of education to the needs of different people. What is more, he makes no adjustment at all for the differences in the quality of education received as one moves from one place to another. He simply assumes that the benefit received from government expenditure on education by a primary class student in a mud-walled, single-teacher school in a remote rural village is the same as in the case of a student attending an urban primary school in a pucca building with playground and related facilities.

Ahuja takes no notice of sinecures in government. He believes that all those who work for government render certain services and that people benefit from their services.

Ahuja believes that even those who *collect taxes*, *render services* which have the effect of augmenting the incomes of certain people. He has come up with all kinds of formulae for allocating the benefits from expenditure on collection of different Central and state taxes. Here is an example : 50 per cent of the expenditure on account of collection of estate duty and wealth tax has been allocated according to the ownership of land by households, and the remaining 50 per cent according to the ownership of pucca houses !

Ahujaa says, repeatedly, that while both Kanpur and Thanjavur are progressive districts, Gaya is a backward district. He even explains the relatively higher degree of inequality in the distribution of benefits from government expenditures in rural Gaya in terms of the backwardness of Gaya. But what is the criterion of backwardness? Ahuja does not say a word on this. If income per household is taken as the criterion of backwardness, Gaya does not rank lower than both Kanpur and Thanjavur. According to Ahuja's own data, Gaya's annual income per household (Rs 4,355) ranks lower than Kanpur's (Rs 5,372), but higher than Thanjavur's (Rs 4,108).

It is unfortunate that even the experts sitting in the Yojana Bhavan did *not notice such an obvious blunder*. Maybe they were not expected to do that. Maybe all that they were expected to do was to give a handsome project to Ahuja so that he could issue a certificate saying that "there is little truth in the commonly heard statement that benefits from government expenditures do not reach the poor". But who made the statement that benefits from government expenditures do not reach the poor? For reasons best known to him, Ahuja has not cared to say even a word on this point.

Ahuja's study is nevertheless worth reading. It is unfortunate that the book is poorly edited and spattered with printing and other mistakes. Here is a sample: "It is likely that users of services of employment exchange belonging to upper income brackets will be candidates from relatively poorer houses."

* See Anand P Gupta, "The Poor, the Non-Poor and the Taxes They Pay in India: A Statewise Study", Institute for Public Policy Analysis, New Delhi, 1978.

Dominant Castes or Rich Peasants?

John MacDougall

References to 'dominant castes' and 'rich peasants' are frequent in literature on contemporary rural India. These phrases are used, explicitly or implicitly, to describe the nature of rural power structures. These phrases refer to two somewhat different concepts, yet the concepts are rarely compared, or otherwise related to each other. Are the two concepts complementary or mutually exclusive? If the latter, which concept is preferable?

It is the purpose of this paper to discuss these issues.

I
Introduction

IN the literature on contemporary rural India, we often find references to 'dominant castes' and to 'rich peasants'. Explicitly or implicitly, these phrases are used to describe the nature of rural power structures. These phrases refer to two somewhat different concepts, yet the concepts are rarely compared, or otherwise related to each other.[1] Are the two concepts complementary or mutually exclusive? If the latter, which concept is preferable? It is the purpose of this paper to discuss these issues, in a preliminary way.

The discussion will be preliminary, because of the enormous amount of data available and needed for rigorously evaluating the dominant-caste and the rich-peasant theories; and, more fundamentally because we lack careful theory-construction from the information we now possess. It is therefore far from clear what would constitute valid and powerful tests of the merits of the two concepts. Consequently, in much of this paper I will treat the two concepts from a theoretical point of view: I will examine their rigour clarity, and ability to generate novel and compelling insights. I will, pay some attention to empirical data, however, especially to what I take to be the major national trends since India gained Indepedence (especially development efforts) and the important features of social structure and process which are found in many Indian villages.

II
Concepts

Power, Influence and Elites: Since this paper is concerned with power structures, I will at this point briefly discuss power and related concepts. I focus on power of social groups and of aggregates of social role incumbents (or social groups for short), rather than that of individuals. Then power may be defined as the ability of a social group to significantly affect the lives of other people, even if the latter resist within normal institutional settings. By confining my attention to normal settings, I imply that power is a probability, and that a group's power may change in the event of a crisis or other change. This alone can give rise to problems in locating power in third-world societies, since changes are common and far-reaching in many of these societies.[2]

Power may be distinguished from influence, or the effect that one group has over others in a society. When efforts to exercise influence are resisted, influence may vanish. This idea allows us to differentiate between power on the one hand, and elites or leaders on the other. Elites are those in roles which are particularly valued or which have major effects on others, while leaders are people who are obeyed through voluntary consent. It is logically possible for both types of social actor to lose all their influence when they are resisted.[3]

The numerous changes now taking place in India and other third-world countries are likely to be popular with some groups, and unpopular with others. So we may expect conflicts about the desirability and implementation of many changes, and it is more fruitful to focus on power structures in third-world societies than on elites or leaders. This is especially true, if we are looking at the role of social groups possessing influence or power in stimulating *or hindering development efforts*, which is a major reason for analysing power structures in the third world. It is to the concept of development that we turn next.

Development: I refer here to 'development' and not to any particular kind of development such as political or economic development, because in India the government has pursued since 1947 a broad policy of development, and because the groups with most power in rural India appear to have played a major role in determining the nature and effects of not only economic but political and social development policies. Development may be defined, then, as deliberate efforts to achieve increases in the average citizen's (i) economic well-being, and (ii) voluntary and rational participation in legitimate regional and national institutions.[4]

I give some evidence as to the extent and nature of development in Part III of this paper, so I will defer till then the question of what constitutes valid indicators of development. However, some general observations on the concept are in order. First, I confine my attention to *deliberate* efforts to 'improve' the individual's situation, since the post-War period has been marked by the seriousness of such efforts, and this can be expected to make this post-War period different from the pre-War period as regards the type of authority that powerful rural groups can claim, and the types of resources that might be made available to these groups. Of course, development efforts may lead to the opposite of the desired effect, and policies seeking some goal other than development may in fact increase (say) per capita GNP or literacy. But such phenomena are not what we usually mean by development when we refer to 'the developing countries', etc.[5] Nonetheless, the effects of development efforts may well be indirect and diffuse, especially when we consider the impact of such programmes as adult education or community development.

Secondly, *development is analytically* quite different from social justice. But empirically, a particular policy may pursue both ends. An important example of this is land reform, which is sometimes justified on the grounds that it makes more land available to more productive cultivators — i e, it promotes development — and at other times on the grounds that it reduces inequities in the distribution of the most important rural economic resources,

The Dominant-Caste Theory[6]: According to this theory, in many of India's villages there exists a particular caste which possesses most of the major power resources — *viz*, large numbers of caste members; high ritual status; most of the land and other economic assets; the performance of functionally influential and valued occupations; relatively advanced levels of Western education; and occupancy of authoritative offices in traditional/informal and modern/formal local-government institutions.[7]

By 'caste' I mean *jati*, or local group with hereditary membership, which has a local name, performs some traditional occupation(s), is endogamous, and is ranked relative to all other such groups (the ranking is mainly according to ritual purity, expressed in such norms and practices of social interaction as the giving or receiving of food). While space does not permit me to discuss the corollaries of this definition, I will observe here that castes frequently are found in several approximately adjacent villages, because of norms of village exogamy, and because some castes practise occupations that require them to find patrons or clients in other villages.[8]

The dominant-caste theory implies that castes overlap in their positions on the various stratification dimensions, and that a high position on one dimension helps the caste to be in high positions on other dimensions. For instance, a caste with many members relative to the village's population, and possessing most of the land in the village, can then use the coercive power that land and numbers confer, to succeed in efforts to get elected to official positions in official *panchayats* (councils) and in claims to high ritual status. The following is a striking, albeit perhaps extreme, case in point:

> Of 384 current residents of Sirkanda, 90 per cent are Rajputs . Rajputs own 94 per cent of the arable land surrounding Sirkanda ... A Rajput family has the only locally-owned and operated shop, and another Rajput family owns the building in which the outside merchant keeps his shop. Low-caste income is derived primarily from high-caste villagers in return for service as artisans. It is therefore apparent that Rajputs are economically the dominant caste in Sirkanda.).
>
> The president and vice president of the village council, as well as their opponents in the last election and their predecessors, all are Rajputs... .
>
> A frequent criticism which low-caste people voice against the village council is that it is dominated by Rajputs and therefore dispenses 'Rajput justice'....
>
> In the more important realm of traditional leadership and power in the village, Rajputs play the dominant role . . Rajputs are always represented and dominate even though their caste-fellows may not be involved in the issue at hand.[9]

What are the broad theoretical and ideological presuppositions behind the dominant-caste theory? The answer to this question is not clear, but dominant-caste accounts of power in rural India are often pluralistic. A pluralistic view of power is found especially in studies which treat the extent of dominance as a variable, and so admit the possibility that many castes or other groups have access to power resources, and therefore share power in the village. Moreover, dominant-caste accounts often point out how castes which dominate different regions must form coalitions in state or national politics, but thereby invite non-dominant castes to form similar supra-village coalitions which may increase the power of these lower castes. Coalition formation is also a result of factional behaviour, which I discuss below.[10]

Like their counterparts in analyses of power in industrialised countries, these pluralistic accounts by implication derive from a functionalist view of society. For instance, in Sirkanda, the existence of a dominant caste is thought to make people's roles and identities very clear to them, and hence contributes to the stability and smooth functioning of the division of labour.[11] At the state and national level, co-operation between castes and regions is encouraged, and the political system thereby stabilised.

The Rich-Peasant Theory: This is a theory of political and economic control, and of its consequences. Specifically, it is held that, since Independence, command over the economic surplus in the village and of the village's formal and informal political institutions, has increasingly passed to rich peasants. Through this control, rich peasants have been able to channel the lion's share of the government's development resources to themselves and away from low-status groups, and also to exert major power in state and local governments. As a result, the rich peasants have been able to protect their control of intra-village economic and political processes.

Who are peasants? Following Wolf, we may characterise them as self-sufficient agriculturalists who transfer some of their product (which constitutes part of the village's economic surplus) to non-cultivating group(s).[12] Rich peasants then, are those who own the largest amounts of land. In the contemporary Indian context, such peasants produce an economic surplus above their family's needs, usually rent out some land and/or hire labourers to work some of it, and do not cultivate the land with their own hands. The rich-peasant theory implies further, that while there may still be non-peasants in the village, they acquire less and less of the economic surplus, and their functions where lucrative (e g, those of teacher or trader) are increasingly performed by rich peasants or by members of rich peasants' lineages.

Details of the rich-peasant theory are unclear in the literature, compared to the details of the dominant-caste theory. But the intellectual and ideological origins of the rich-peasant theory are quite clearly Marxist. Specifically, it is assumed that the major power resource is control of village political institutions and of the means of production, and that any caste-purity or occupational-prestige disabilities that rich peasants may incur are relatively unimportant. It is also assumed that peasant society is (at the least) likely to be stagnant, but that in the current historical era peasant society is being forced to change by the intrusion into it of the dynamic international-capitalist society. In particular, rich peasants act in part as peasants have always done, but in part as early-capitalist entrepreneurs, who hire free wage labourers, sell their product in a competitive market, and use the profits on the sale for productive investment.[13] For example,

> The abolition of *zamindari* [the institution of government tax-farmers, introduced by the British in some parts of India] enabled two interrelated processes to take place among the peasantry in Desipur. First, economic differentiation occurred in a more dynamic way as the richer peasants used their surpluses for investment and in effect accumulated capital which further inhibited the capacity of others in the village to accumulate. Sharp horizontal cleavages between classes of peasants were created in the village; and the class unity generated by the fight against the Zamindar disappeared. Secondly, political leadership in the village remained with the same families, but their power was now more autonomous, derived from *their* absolute control over a significant proportion of the principal means of production—land. Whereas before, their status as tenants and the dependent nature of their political power had given them a static

function as a vehicle for the upward transmission of surplus, now they were emerging as a rich peasant class, consisting in Desipur of about six extended families, which was able to expand its economic and political domination of the village.... In Desipur, one of the [illegible] households, headed by [illegible], has established a small grain-milling plant — the only such plant in Desipur — on the basis of private credit from a marwari [member of an ethnic group from Rajasthan in Western India that traditionally engaged in trade] in a nearby town. The same family has a government 'fair-price' shop, from which certain commodities — kerosene, oil, sugar, etc — are sold under licence.[14]

III

Changes in India since Independence

Politics and Development; Some Trends: The purpose of this section is not to give a historical account of events since 1947, but rather to suggest some broad trends and thereby to orient the reader to the background against which village-level processes have been occurring.

The most striking trend, I submit, is that in (broadly speaking) the 1950s, development efforts were not very controversial, and so not an issue in politics; but in the nineteen-sixties and seventies, this is no longer true. Starting in the early sixties, rural development strategies were apparently failing, especially on the food-production front. Consequently, nation-wide institution-building activities were curtailed, and replaced by the technological package of the Green Revolution, which was selectively aimed at rich regions and cultivators. This change of policy was probably bound to generate political conflict, and the conflict was aggravated when the high-yielding varieties ceased to be so high-yielding in the years 1972-75, partly because of the post-1973 escalation of oil and fertilizer costs.[15]

The controversy over development and other policies was greatly augmented by the nation's political travails during the past decade and a half. Between 1962 and 1971, India was involved in three wars with its neighbours, which drained resources from development to defence. In the sixties the amount and source of foreign aid became more uncertain with the US withdrawing from the Bokaro steel plant and massive but temporary infusions of American food aid in the scarcity years of 1965-67 and 1975. Since 1967, the internal political system has been more unstable, not only as regards changes in whichever party is in office, but as regards the increasing use of extra-constitutional measures by opposition groups (major instances were the movement led by Jayprakash Narayan in 1974-75 that sought to oust corrupt politicians, and the often-violent land-grab and landlord-killing movements), but also by the government (not only in the Emergency of 1975-77, but also in its predecessors, such as the Maintenance of Internal Security Act and Indira Gandhi's increasing reliance on the FBI-like Research and Analysis Wing).

Some Indicators of Development: In spite, or perhaps because, of the increase in politico-economic tension since about 1960, development has continued, *albeit* often at a slower rate. In the economic sphere, foodgrain availability has registered a modest overall gain: from 394.1 grams per capita per day in 1950, to 447.2 in 1960, to 495 in 1973. In the period 1966-76 — i e, during the period when the high-yielding variety programme was in full swing — food production grew by a mere 2.5 per cent per year (taking both good and bad harvests into account). This is a lower growth rate than that experienced between 1947 and 1965; but it is still reasonably creditable, in so far as the earlier growth was largely the result of increases in crop acreage, while after 1965 the extensive margin had been reached, and the Green Revolution made possible some growth in yields. Further, the number of tractors jumped from 39,603 in 1961-65, to about 200,000 in 1974.[16]

Turning to some other indicators of economic and social development, despite heavy (but declining, proportionally) public-sector investment in industry, the proportion of the population living in rural areas, hardly changed: it was 82.7 per cent in 1951, 82.0 per cent in 1961, and 80.1 per cent in 1971. However, the extent of surfaced roads grew by leaps and bounds, from 243,000 kilometres in 1951, to 448,000 in 1961, and 474,000 in 1972. Literacy registered significant gains, from 51.6 per cent of the whole population in 1951, to 24.0 per cent in 1961, and 29.45 per cent in 1971 (or 23.7 per cent in rural areas in 1971).[17]

Finally, an indicator of political participation is the proportion of the electorate that votes in elections. Let us consider state Assembly elections — in which rural people are most likely to be interested, and whose outcome is probably most important in its impact on villagers. Here there has been a slow but steady increase in the proportion voting, from 50 per cent in 1952, to 52 per cent in 1962, to 58 per cent in 1972.[18]

IV

The Two Theories Compared

In this section, I focus on three issues, since they bear closely on the logic of the two theories, and they are empirically interesting. Before I turn to these three issues, however, I would like to briefly discuss some other points.

First, it may be said that the dominant-caste theory is preferrable, since it employs a concept more central to Indian culture than the concept 'peasant'. To be sure, social scientists should take very seriously the concepts and terms used by the people they study, and discuss their terms with their informants. But ultimately, social scientists must stand by their own terminology, especially that terminology which facilitates fruitful comparative analysis. In addition, if social scientists are to only use local people's concepts, then which of those concepts are they to choose? This problem is especially serious in a country as hierarchy-ridden, as large, and as heterogenous as India.

This brings me to the second point: The enormous size and variability of Indian society. While I will refer to processes that appear to be common in many of India's villages — especially perhaps those in the more densely-populated regions — yet a major task in any analysis of nation-wide patterns of inequality in rural India is to determine the degree of variation and the effect on inequality of such factors as ecology, cropping pattern, size and heterogeneity of village, and historical experience. With many studies of villages in post-Independence India now available in published form, it should be possible to perform much of this task by a careful analysis of existing data.

Third, I will not discuss the crude applicability of the dominant-caste or the rich-peasant theories. To be sure, many of the best-known village studies point to one *jati* owning most of the local land, controlling village panchayats, being relatively well-educated, etc Further, we may observe that in 1954, 13 per cent of the rural households in India owned 65 per cent of the land, in 1961-62, 69 per cent of the credit in rural India was provided

by local landlords, merchants or money-lenders; and in the same year, 40 per cent of rural households fell below a conservatively-defined poverty level.[28] Such data suggest *both* theories are correct.

And a fourth point is relevant here. It is very important, even though I do not dwell on it at length. There are many similarities between the two theories, despite the great difference in the broad ideological assumptions they make (see Section II). Thus, according to both theories, one power resource alone is not sufficient, and superior intra-village power requires that one's group also control some extra-village power resource(s). It is further agreed by partisans of both theories that primordial loyalties (to use Geertz's terms) may still be very strong in today's villages — not least, even for rich-peasant theorists, loyalties to caste — yet such loyalties are sometimes used in a very calculating, opportunistic way.[30]

While the rich-peasant and the dominant-caste theories are thus supported superficially by much evidence, and while they have many points in common, there are still several important processes that the theories point to, where the theories suggest different decisive principles at work. When for example a factional dispute rends a village in contemporary India, is this at bottom a conflict based on caste or class cleavages? (Perhaps we should call rich and poor peasants members of different strata rather than members of different classes. There certainly is plenty of evidence that we cannot neatly divide the inhabitants of many villages into landowners, share-croppers and landless labourers. Nevertheless, we also now know of case after case where the differences of wealth and authority between typical rich peasants and typical landless labourers — and sometimes typical small landowners — are enormous. In view of this, the term 'class' is used here, in preference to 'stratum' which suggests finer gradations and less inequality.)[31] So let us now examine three types of social process in rural India.

(1) *Supra-Village Power Processes*: As I have mentioned, dominant (and other) castes often have to operate across several villages, because of village-exogamy norms and the specialised castes' inability to support themselves in only one village. Moreover, in the current period of universal suffrage, many electoral compaigns appear to be at bottom expressions of conflicts between rival dominant castes. In the process, members of dominant castes recruit from among the subordinate castes in their attempt to form sufficiently large vote banks. This may give rise to, or influence the course of, factional disputes. I discuss factionalism in greater detail below, but here I point out that factional conflicts often cross class lines, and thereby make it (at least) possible for conflicts to be organised along caste lines.

On the other hand, the participation of rich villagers in the broader economy is not very satisfactorily explained by resort to dominant-caste reasoning, and in this area rich-peasant theory is preferable. To be specific, participation in the market outside the village is quite well explained as a result of economic and political tensions impinging on the rich-peasant class as it comes into contact with the early-capitalist economy. For example, Breman[32] has analysed the causes for the shift of the Anavil Brahmin rich peasants from rice to mango cultivation in Southern Gujarat. These causes are, first, the availability of better transportation facilities, which made possible the marketing of a perishable crop like mangoes; and second, the desire of the Anavils to continue to be rich while personally involving themselves in cultivation to the minimum. The Anavils' means of maintaining such a life-style on the basis of rice cultivation were jeopardised by the greater ability of their traditional landless servants (Dublas) to leave the village temporarily for work in urban brick-yards. In this instance, power is exercised by one caste over another. But the reasons for the change in the basis and extent of the Anavil's power have more to do with their need for economic control and a secular life-style, than with their desire to maintain caste purity and solidarity.

Moreover, when we consider the participation of rich villagers in the district- and state-wide political process, the rich-peasant theory readily suggests ways in which such villagers are able and anxious to involve themselves in politics. They are able to do this, because their trade, moneylending, and related activities, force them to gain an understanding of the world of official permits, organisational charts, and so on. Moreover, they need the support of the relevant politicians and bureaucrats in order to protect their economic interests. These contacts with urban politics have been strengthened and multiplied with the establishment of the community-development programme in the late 1950s; and the struggle for scarce government resources was no doubt exacerbated as the development decisions became more controversial — as I suggested in Section III.[33]

(2) *Cyclical Processes*: It may be argued that the dominant-caste theory is preferable because, despite all the efforts of the past 30 years, Indian villages by large remain stagnant. To a considerable extent, this view is grounded in the analysis of cyclical processes in rural India, since this analysis suggests that Indian villages can insulate themselves from external forces for change by absorbing them into cyclical changes that have occurred for centuries.

One such change is caste mobility *via* Sanskritisation. Briefly, Sanskritisation is the process whereby a *jati* that acquires more economic resources and authority in the village successfully raises its ritual status by (for instance) manufacturing a new mythical genealogy; and these claims to higher status succeed after a few years because even ritually superior *jatis* acknowledge the *nouveau-riche jatis*' political and economic power. Srinivas, the originator of the concept of Sanskritisation, has suggested that *Harijans* (untouchables) cannot usually succeed in their efforts at Sanskritisation because of the ritual abys that separates them from 'clean' Hindus — not to mention their abysmal economic and political powerlessness. No doubt, this is true; but we also know of many cases of ranking efforts (if not always Sanskritisation, though the neo-Buddhist movement might be seen as a kind of effort at Sanskritisation) on the part of *Harijans*. In any event, efforts at caste mobility which use the language of ritual purity can be easily explained by the application of dominant-cate analysis.[34]

It can also be argued that Sanskritisation efforts may result in major changes of the rural stratification system — but I defer discussion of this topic to the next section.

A second cyclical process that has been studied at length is factionalism. It is suggested that in many villages — especially the larger and more hateroge-neous ones — the typical structure of social relations and political conflict is one of factions. The shape of a village's factions is a set off inverted trees, like the following (where solid diagnonal lines indicate ties of obligation and loyalty, and points are lineages).

The ties of obligation that cement faction-members together include those of *jajmani*, which is the structure of norms governing the performance of

tr[illegible] one caste for another, and the payment of castes for such performance. However, factions compete for members, especially when coercive power is derived largely from numbers of able-bodied male supporters. It also appears that villagers have always shifted from one faction to another when the rewards for doing so outweighed the risks. So, while faction membership it is also often opportunistic in practise. This combination of forces allows forces allows for flexibility in the village power structure (or that of a group of villages, where the factional conflicts are focused outside the village).[25]

Now, in so far as factions divide villagers into vertical groups rather than horizontal ones, it might be said that the evidence about factionalism should be counted against both the dominant-caste and the rich-peasant theories. This point is conceded, and in so far as it is justified by the evidence, it argues for a distribution of power in Indian villages that is more explicitly pluralistic than the distribution indicated in the dominant-caste theory. However, as I indicated in Section II, most proponents of the dominant-caste theory treat the degree of dominance as a variable. Moreover, in even the most faction-ridden village, inter-caste relationships remain an important factor determining who belongs to which faction.

(3) *Secular Changes:* India's villages are said increasingly to be undergoing profound changes, and becoming what they never were before. Let us briefly consider some of the changes that are said to be occurring.

First, it is claimed that the cyclical processes I have just discussed are taking on new forms and are being absorbed into the secular changes, so that they are no longer mere cyclical changes. Harold Gould has suggested that even in villages, some Brahmins react to Sanskritisation by claiming a monopoly on new sources of prestige, as Western education. Moreoever, Sanskritisation efforts may well bring their participants in today's villages into the wider political arena, as they seek allies in their own or other castes and form caste associations, factions within parties, or even new parties. To the extent that these changes take place, they weaken local *jati*, as the bond that ties people together, and facilitate (if not compel) rich-peasant loyalties. Claims to Western education as a source of prestige are inherently individualistic, and may increase people's awareness that they belong to at least a status-group if not a class. The [illegible] may happen when members of the same or similarly-ranked *jatis* engage in urban politics and are required to use the rhetoric of Western politics.[26]

Turning now to secular changes as such, the rich-peasant theory is itself a theory of secular change, while the dominant-caste theory is not (cf. Section II). At the village level, any studies suggest that the *jajmani* system is breaking down (sometimes as a result of outright refusals by lower *jatis*), and traditional obligations (say to work on a landlord's land) are being replaced by the employment of casual (increasingly migrant) labour. New occupations are harder to classify as regards *ritual* purity, even though their secular prestige may be unambiguously ranked. New settings of sociability, such as buses and tea stalls, are more and more used by villagers, and do not permit the rigid observance of caste-ranking norms. These changes *allow* for class to be more important as a major operative principle in the villages' lives. Moreover, there is evidence that class is *likely* to be increasingly important, since non-agricultural economic resources, such as credit and trade, are probably more and more monopolised by rich landlords (as we saw in the case of Desipur village in Section II).[27]

There are, too, factors operating at a level above that of the village, which appear to bear out the hypothesis that class is becoming more and more powerful as a basis of power. I have pointed out how rich peasants are able and willing to engage in district- and state-wide politics. In this they have been helped by and large by many of the development programmes of the past three decades For example, the abolition of *zamindari* and the non-enforcement of land-ceiling laws have benefited rich peasants, as have green revolution programmes in the districts involved. We also have plenty of information on how members of the rich peasantry have been able to turn most district and state political decisions to their advantage (especially when we consider the all-important process of implementation of laws and regulations rather than their enactment). Not surprisingly, these people dominate not only official governmental institutions, but also co-operatives and (at least at the district level) many political party machines; and they frequently receive the lion's share of the irrigation water, agricultural and industrial loans, and the other development resources the government dispenses to rural areas. To be sure, members of locally dominant castes no [illegible] benefit from these processes, but I suspect that increasingly it is the richer members of these castes who receive most of these benefits.[28]

It might be objected that the case for the rich-peasants theory has been overstated, since in rural India class-based political parties still receive little support, and factional parties are more common (even in regions that are linguistically and religiously homogeneous). However, the existence of a class society is a different thing from class-consciousness, or from the involvement of a class society's members in class-based parties. Further, in those rural areas where caste organisation is weakest, class-based parties are strongest — for example, the Communist Party of India (Marxist) in West Bengal.

V

Conclusions

Is the rich-peasant preferrable or the dominant-caste theory preferrable? This question is hard — indeed, impossible — to answer conclusively, given the lack of data that would permit a rigorous test. Indeed, one useful conclusion one can draw from this hurried survey of some of the evidence concerns what would constitute rigorous tests. I suggest that the following would be informative tests: In villages — especially conservative ones where social distance between castes is great and norms of caste interaction are rigidly enforced — do we find that agricultural labourers are increasingly hired on the basis of their ability to work rather than of their caste, and on a casual money-wage basis? Of course, membership in a particular caste is often treated by employers as evidence of reliability and competence at work. Nevertheless, we might find rural employers increasingly flexible about which castes they should recruit from.[29] In caste associations spanning groups of villages or even several districts, do we find increasing co-operation on class grounds, even in conservative regions? In state-wide debates about rural legislation and its implementation, especially regarding issues in which ritual interests are at stake, are the victors characterised more by their caste with wealth varying, or by their class with caste varying? Issues that one might examine in this way are the abolition of village-level untouchability and land reform (on which the laws vary from state to state, as does the states' caste composition).

However, one can also make some tentative choice between the two theories on the basis of the sorts of con-

[illegible] my [illegible] (socialists) reject

paper [illegible] to consider the possibility that rural India has been undergoing major secular changes in the decades since Independence — which may, of course, be the continuation of changes during British rule and before. Given this, the dynamic emphasis of the rich-peasants theory makes it greatly preferrable. Moreover, by postulating the existence of two systems in tension — the peasant and the early-capitalist — the rich-peasant theory allows for variation in the form and presence of change, and can explain the apparently slow but irreversible pace of change in many of India's villages. The theory also accounts for the apparently novel intensity and strength or class feeling evident in some recent rural conflicts in India (not that India is about to become another Viet Nam: episodes like the burning of agricultural labourers' huts in Thanjavur district in 1969 were ephemeral as overt outbreaks).[30]

However, the rich-peasant theory has been elaborated to nearly the extent that the dominant-caste and cognate theories have been.[31] Bearing in mind the similarities between the two theories that I pointed out in Section IV, I suggest that the rich-peasant theory can draw on insights and hypotheses suggested by the dominant-caste (and other) theories — and perhaps in certain respects, can be merged with the dominant caste theory — especially in the following areas.

First, processes of legitimising village power structures. It is very likely that many rich peasants continue to use caste status to legitimise their power, and we need to know more about when and how rich peasants Sanskritise and employ abstruse texts to confuse the thinking, and generally occupy the intellectual and social energies, of petty landowners, landless labourers, etc.

Second, and in conclusion, the nature of supra-village processes deserve closer attention. For example, a few network studies have traced flows of political loyalties between castes and from villages to smaller and larger towns[32] But, despite our wealth of knowledge about factions, we do not know much about which networks and types of loyalties are really important, and only a few social scientists have put the insights of network theory to work in explaining rural elites. Some students of caste, such as Bailey, have forcefully suggested that we should see the village, the district, the state, and the national socio-economic/political systems as analytically distinct, and often empirically isolated. Marxists (especially those who this notion of separate systems, or dual economies, but it deserves closer attention by serious adherents of the rich-peasant theory. For example, rich peasants' power may be quite legitimate at the district or state level, but it is much less so at the village level. And for this reason, rich peasants may be driven to use more and more coercion to maintain their power in the village, or may increasingly engage in district-wide commerce and politics as a way of avoiding village entanglements. A hypothesis like this is derived — like others I have mentioned — from the dominant-caste analysis, but could usefully supplement the rich-peasant theory.[33]

Notes

[This is a revised version of a paper presented at a joint colloquim of the Rural Development Committee and the South Asia Pogramme, Cornell University, October 21, 1977. I am most grateful to Jeanne Hom for her research assistance, and to Mitra Das, Barry Gruenberg, Larry Miller, Minoru Ouchi, and Norman Uphoff, for substantive comments and suggestions.]

1 An exception to this is the essays in Andre Beteille, "Studies in Agrarian Social Structure" (New York: Oxford University Press, 1975).

2 Cf Robert Dahl, 'The Concept of Power', *Behavioral Science*, Volume 2, July 1957. Charles Tilly, "From Mobilisation to Political Conflict", unpublished manuscript.

R and D Planning and National Plans

A Rahman
K Sundaram
N R Rajagopal
A V Raman

Ever since 1951 when India adopted the path of planned economic development, the role of R and D as an instrument of social change has been recognised; and in recent years, there has been a conscious attempt to plan and orient R and D efforts to the achievement of national objectives. This paper which focuses attention on the inter-relationships between the R and D plans and the National Plan shows that there has been a broad conformity between the orientation of efforts in the R and D sector and the orderings of different socio-economic objectives in the National Plan, though this broad conformity itself cannot be viewed as entirely a planned outcome.

THE principal objective of any exercise in development planning would be to formulate programmes towards realisation of a given set of socio-economic objectives. Ever since 1951, India has been engaged in such an exercise with the formulation and execution of quinquennial development Plans. India's Fifth Five Year Plan (1974-78) had for its principal objectives removal of poverty and attainment of self-reliance. There has also been a progressively increasing recognition of the role of R and D as an instrument of social change and in recent years, with a conscious attempt to plan and orient R and D efforts to the achievement of national objectives. For the first time in India, a formal 5-year Science and Technology Plan (1974-78) was formulated by the National Committee on Science and Technology (NCST) with the objectives of integrating the S and T Plan with the total National Plan and using Science and Technology as instruments for the attainment of national, social and economic goals.

This study focuses attention on the inter-relationships between the R and D Plan and the National Plan and as such would be of interest to those involved with planning in general and R and D planning in particular.

The question whether or not R and D can be planned has been widely debated. (See works cited under 'References'). The controversy centres round the feasibility or otherwise of influencing the course of scientific progress by resource allocation decisions. Breakthroughs in science are, of course, unpredictable and cannot be planned. Yet, a good part of the Indian R and D effort is oriented to improvement in or is related to existing knowledge and known technology. It is believed that in respect of this part, resource allocation decisions can influence the scope and pace of outcome. Thus, decisions being taken to allocate resources as between R and D and other activities and among R and D programmes would, in the sense of choice among alternatives, constitute planning of R and D.

Scope and Methodology

In India, the perspective of R and D is limited rather exclusively to its technical parameters. A wider perspective, covering the social, economic and cultural facets of the people for whose benefit R and D is planned is generally missing. The scope of the study has been conditioned by this characteristic of the R and D system and as such the study excludes activities connected with the transfer of product/process technology; the practical consequence of this omission, however, is unlikely to be serious.

R and D activity in India is almost entirely in the government sector and is organised under certain major agencies — such as the Department of Atomic Energy (DAE), the Defence Research and Development Organisation (DRDO), the Council of Scientific and Industrial Research (CSIR), the Indian Council of Agricultural Research (ICAR), the Department of Space (DOS), the Department of Science and Technology (DST), the Indian Council of Medical Research (ICMR), the Research, Design and Standards Organisation (RDSO) of the Indian Railways, the Telecommunication Research Centre (TRC) and several R and D units attached to public sector enterprises.

Since the main concern here is the relationship between the R and D efforts (measured in terms of financial outlays) and the realisation of the socio-economic objectives, we exclude from the purview of this study R and D activities of the DRDO and DOS, which are primarily oriented towards the achievement of strategic/defence objectives. Also excluded are the programmes of DAE because of the inseparability of the strategic element in their R and D.

For purposes of analysis, the socio-economic objectives of the Fifth Plan have been recast in terms of (a) meeting the basic needs of food and food articles, clothing, housing, and health; (b) employment and income generation; and (c) self-reliance. (Certain other dimensions of basic needs such as transport, education, energy and environmental quality are also considered.)

Employment and income generation, in turn, is considered from the point of view of efforts oriented towards village industries and crafts, small-scale industries, new economic plants and new economic uses for agricultural residues and by-products and other schemes of rural development (including integrated rural development).

As for self-reliance, it is taken to mean a progressive dimunition in the dependence on foreign aid.

In this study, the research project is taken as the basic unit of R and D. In linking the objectives of these R and D projects with the socio-economic objectives, the content of the R and D activity was analysed and the objectives most likely to be realised as a result of successful implementation of the R and D project were noted. In case of R and D projects with multiple objectives, primacy has been accorded to the socio-economic objectives relating to basic needs and generation of employment and income, in that order. (For reasons of space, we omit here a discussion of computational aspects. The reader may refer to our fuller study cited under 'References'.) Whenever project-wise data were not available the research institution/establishment as a whole was treated as the unit of R and D and consequently the socio-economic objectives were assigned by reference

TABLE 1: DISTRIBUTION BY SOCIO-ECONOMIC OBJECTIVES OF TOTAL OUTLAY ON APPLIED RESEARCH, 1974-79

(Rs in millions)

SEO category	Amount	Per Cent of Total
I *Basic needs*	32,51.11	47.88

to the predominant areas of work of such institutions.

ANALYSIS

Over the Fifth Plan period the financial outlay on applied R and D is estimated at Rs 6,790 million or an average of Rs 1,358 million a year. This, in terms of per capita expenditure, works out to less than three rupees. In judging the impact of applied R and D on the realisation of socio-economic objectives, this size of the R and D effort must be kept in view.

The analysis shows that two-thirds of the total applied R and D efforts are oriented directly towards the realisation of socio-economic objectives. Further, nearly half of them are relatable to the objective of providing food for the masses. The other socio-economic objectives arranged in order of magnitude of R and D efforts are Self-Reliance, Public Health, Mass Transportation, Employment and Income Generation, Education, Clothing for the Poor, Environmental Quality, Energy, Finer Clothing, and lastly Housing (Table 1).

A comparison of the *inter se* rank orderings of the different socio-economic objectives in the National Plan and the R and D efforts reveals that there is a broad conformity between the orientation of efforts in the R and D sector and the National Plan (Table 2). (Starting with the ranking of efforts towards the realisation of different SEOs in the National Plan and the R and D sector, it is seen that the two rank order sets are positively correlated, with the Spearman's Rank correlation co-efficient at 0.849 being statistically significant.)

A closer examination, however, reveals that this conformity cannot be viewed as entirely a planned outcome. For example, a detailed project-by-project analysis of the R and D activities of the CSIR shows that only 22 per cent of the outlay on applied research was on projects identified in the *NCST Plan*.

Even if it is accepted that the observed conformity is an outcome of a conscious effort, a further analysis of R and D efforts towards the realisation of the different socio-economic objectives brings to the fore certain angularities in R and D planning. Thus, while R and D efforts aimed at fulfilling the basic need of "food", appropriately enough, account for 34 per cent of the outlay on applied R and D, the R and D efforts on storage of food-grains is only 0.01 per cent of the outlay, a level which must be judged to be extremely inadequate in the context of colossal losses on account of poor storage facilities/practices.

Again out of a total outlay of over Rs 80 million on programmes for cotton and cotton textiles, (clothing for the poor), the outlay on the development of textile technology is only Rs 5.5 million; and a major portion of even this limited R and D effort is oriented towards the requirement of the large scale sector and not the handloom sector which has an important role in the plan strategy for fuller employment.

In the area of health care, too, while the total R and D effort is significant (5.90 per cent of outlay), its orientation is somewhat disquieting. Thus, though nutrition occupies a strategic place in the totality of health-care systems (malnutrition is often the basis of much of the health-care problems) and is one area where successful R and D promises substantial pay-offs, nutrition-related R and D accounts for only 10 per cent of the total R and D outlay on health. More generally, the relative emphasis on R and D for drug development/development of techology for drugs *vis-a-vis* R and D for better health (including preventive medicine, nutrition and drinking water) is lopsided in favour of the former Also, this is one of the areas in which the need for the complementary perspective in R and D referred to earlier is rather urgent. These are among the three important instances where one notices inadequacies of R and D programmes as instruments in the realisa-

tion of socio-economic objectives of the National Plan.

Our analysis reveals that R and D efforts relatable to the objective of employment and income generation form less than 3 per cent of the total outlay. (Our approach to relate R and D efforts to the fulfilment of the objective of employment and income generation has been made rather cautiously in the full knowledge of the fact that such relationship could at best be contrived. This is so because normally R and D programmes have for their objective certain technological features. At times these may serve employment generation as an additional objective.) Even of this limited effort, R and D programmes aimed at assisting the village and small industries are less than 30 per cent. This must be judged to be totally inadequate in view of the role that village and small industries are expected to play in the plan strategy for fuller employment.

In India, even in civil research, self-reliance has always rated high as an objective of R and D programmes and in the Fifth Plan also R and D efforts towards self-reliance rank second only to the efforts on provision of basic needs. Yet, a number of indigenously-developed technologies remain unutilised and there is continued dependence on import of technologies in many sectors Among the factors affecting the utilisation of indigenous R and D results, the inadequacy of design and engineering facilities to bridge the gap between invention and entrepreneurship ranks very high. Another factor which has often frustrated the efforts of the scientists is the frequent shifts in the governmental policy, especially in respect of importation of technology/product.

Turning to broader aspects of R and D planning, it has been observed that the approach to the identification of R and D programmes leading to development of indigenous technologies is to conceptualise them within the framework of the capabilities currently available in the institutions where they are to be undertaken. This imposes avoidable costs in time and money on the transfer of technologies, particularly when capabilities for design and engineering/upscaling lie outside the institutions undertaking R and D programmes.

Another disturbing feature of R and D planning in terms of allocations of resources is a tendency to spread the resources — monetary and scientific — over too many sectors/programmes. Thus, out of a total of 24 R and D sectors, the outlay per sector was less than two per cent of the total in the case of as many as 11 sectors. Again in about half as many of these 11, the share of each was even less than 1 per cent. Also indicative of this tendency is a very high ratio of the number of projects to the number of scientific staff in the national laboratories.

The analysis here has been in respect of the R and D programmes of the Fifth Plan. The new Five Year Plan accords top priority to the objective of "removal of poverty" with a relatively lower emphasis on "self-reliance". It is well recognised that in the totality of planned efforts at removal of poverty, R and D has but a limited role. Even this limited role is conditioned by the magnitude and nature of R and D projects that could have a bearing on this objective The class of R and D programmes which have been grouped in this analysis as meeting the objectives of "Food", "Clothing", "Housing", and "Employment and Inrome Generation" are illustrative. In respect of other R and D, considering the fact that most of the projects have self-reliance as their principal objective, and that in the new Plan also they would retain their continuity with the Fifth Plan, it would be unrealistic to expect such R and D (mostly industrial R and D) to contribute directly to the objective of removal of poverty.

Equally, it must be noted that a search for R and D solutions to problems of poverty need not involve a down-grading of what has come to be known as "big science". For example, R and D efforts in the area of utilisation of solar energy, utilisation of biomass as human and animal feeds and, at a different level, tissue culture for mass propagation of flora have promise of substantial pay-offs.

To sum up, there is presently an urgent need for strengthening the institutional framework and the mechanisms for R and D planning in India. The present analysis would, it is hoped, indicate some of the directions in which such strengthening should occur

THE INDUSTRIAL CREDIT AND INVESTMENT CORPORATION OF INDIA LIMITED

SPEECH OF THE CHAIRMAN
SHRI J S RAJ

Pick-Up in Domestic Demand

A broad-based recovery in domestic demand was perhaps the most encouraging feature of the economic scene in 1978. For a wide spectrum of industries, revival in demand removed a constraint which had hampered expansion in output in the recent past.

The improved utilisation of capacity, following the pick-up in demand is reflected in acceleration in the rate of growth in industrial output in 1978. In due course, the changed market situation should provide relief to cash flows of industrial units, many of which experienced liquidity strains due to prolonged period of slackness in demand.

But in a situation when inadequate supply of power and industrial unrest restrained full utilisation of capacity, the revival in demand is leading to shortages. In core industries such as cement and steel, capacity constraints have already developed. This phenomenon is likely to spread to other industries, with the strengthening of domestic demand and working off of the existing spare capacity. The imbalance between demand and market supplies might get further accentuated if the expectation of price rise encourages the accumulation of goods in the distribution pipeline. Although the overall price situation seems to be under control so far, the latent inflationary potential arising from a rapid monetary expansion in the last few years cannot be underrated. Effective steps therefore, need to be taken for augmenting supplies.

More Policy Options

Fortunately, at present there are more options for policy-makers for dealing with the situation than have been available at any time during the last 20 years. Augmenting supplies through imports has emerged as a distinct policy option for alleviating a situation of shortages. Like the buffer stock of foodgrains, foreign exchange resources have enhanced the capability of Government to meet current consumption needs and soften the impact of fluctuations in the supplies of essential goods and industrial raw materials.

But imports cannot be a substitute for the creation of additional capacity in the industrial sector. On the other hand, the present comfortable foreign exchange reserve position and other favourable factors should be used, not merely to deal with temporary shortages but for creating additional industrial capacity to put an end to the recurring shortages of the past.

Shortcomings of Regulatory Measures

Price and distribution controls, which have so often been used in the past for tackling the problems arising from shortages, have to be seen in this light. The results of such measures have been altogether counter-productive. As controls pegged prices to a fixed level, investment in controlled industries was rendered unremunerative. Extension of price and distribution controls would, therefore, not be in the interest of the economy.

While the recent liberalisation in import and industrial licensing has increased the role of the market mechanism in economic decision-making, it has not been fully in tune with the growth needs of the economy. In the operation of these policies several problems remain. Some of the well-meaning measures to promote investment in certain industries, under conditions of price control have made the existing controls more complex, resulting in individually determined retention prices for each new unit in the industry. The economic merits of such a system are open to question.

Likewise, although the cost of bank finance has been somewhat lowered, credit allocation has tended to be overcentralised in recent years. In a system where central bank supervisory control over credit is fixed with regard to the quantum of credit authorised to individual projects, the responsiveness of the system to the needs of industries particularly those with working capital intensive operations, has left much to be desired.

While action by monetary authorities to prevent the use of bank credit for stock accumulation might be warranted should shortages persist, care should be [illegible] the credit [illegible] does not hamper production. The general tightening and regulation of bank credit, without such precaution, has created financing problems, particularly for new industrial projects, in the recent past. Many of these projects were struggling to overcome liquidity strains created by escalation in capital cost on the one hand and a prolonged period of sluggishness in demand on the other. A different style of monetary surveillance needs to be evolved which ensures that there is no cut back in credit for production. Credit plans must also make adequate provision for meeting the financial needs of new projects.

Healthy Growth of Industrial Sector

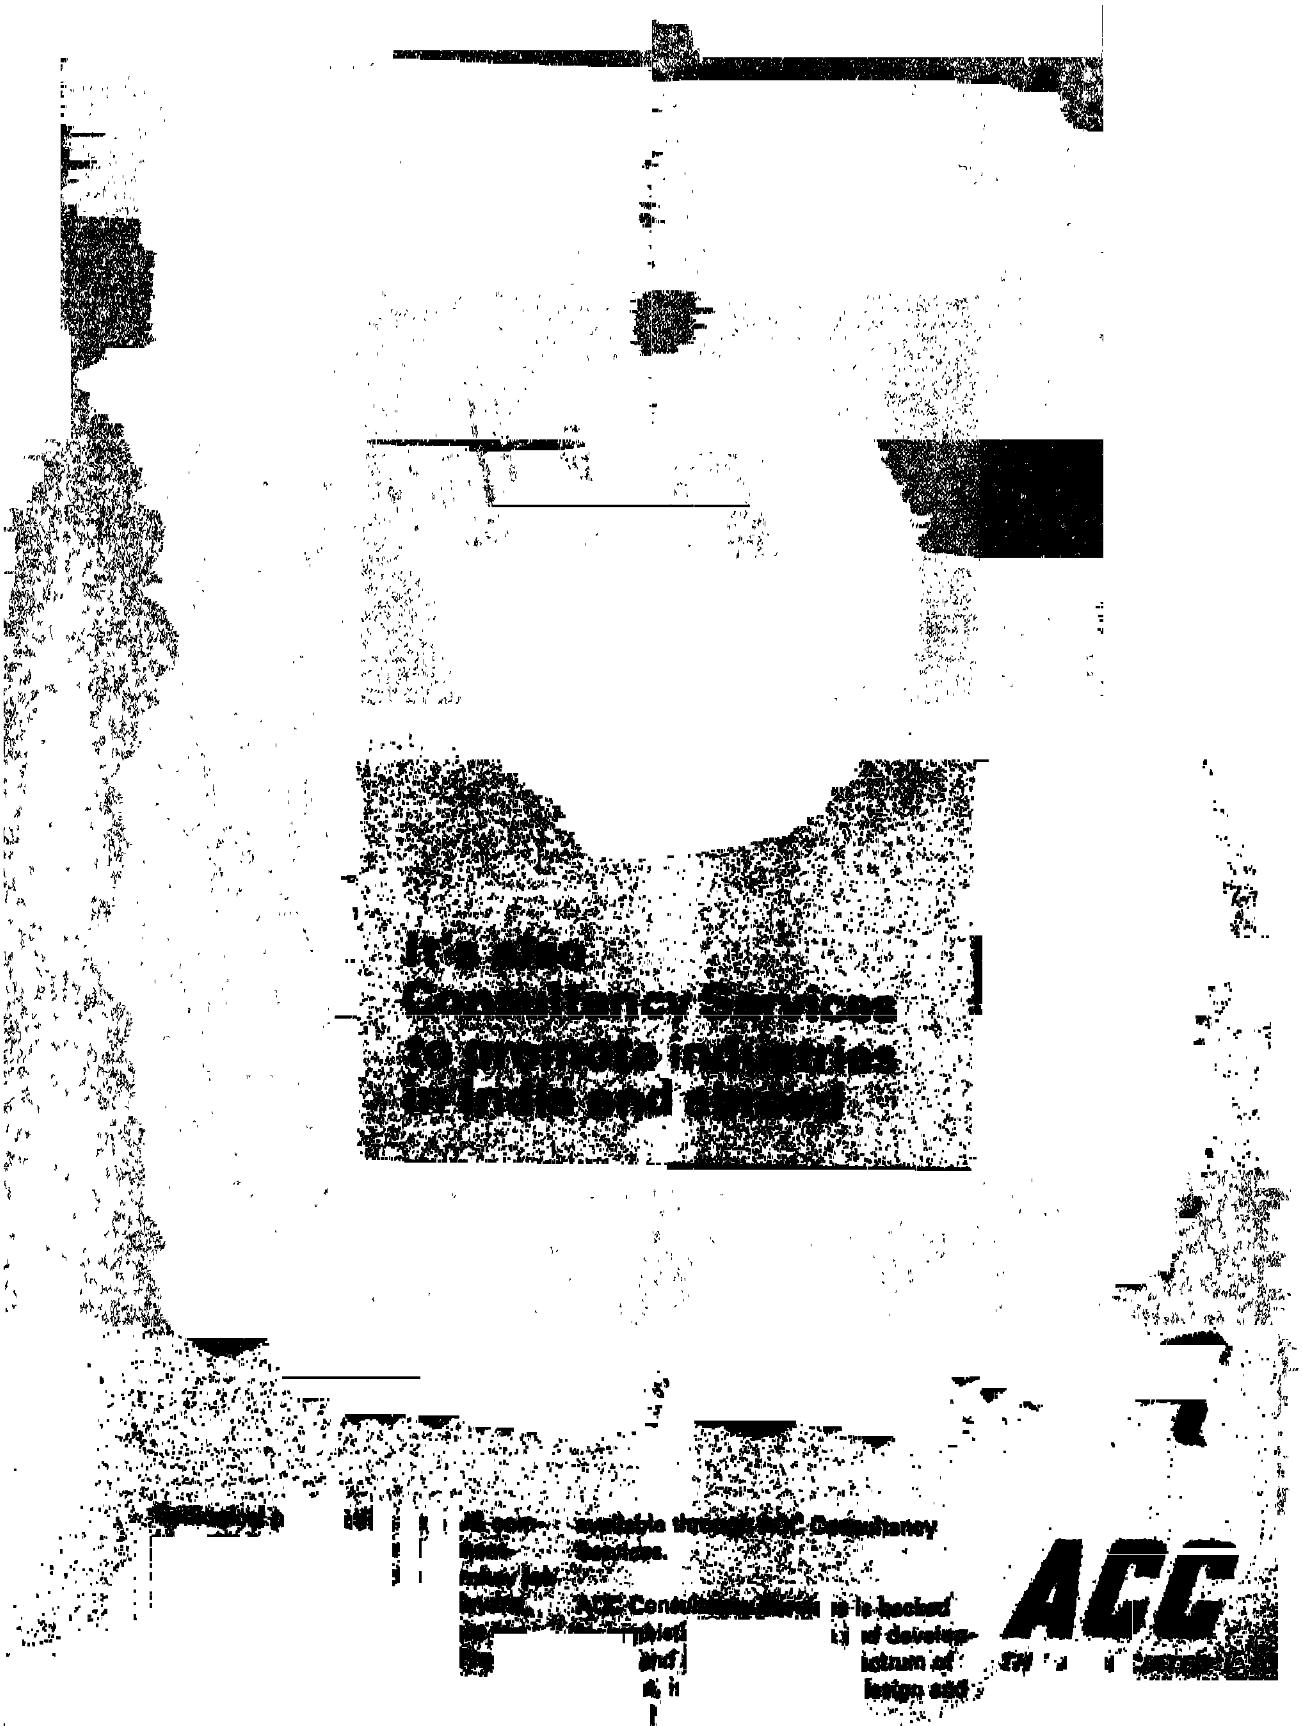
In the past, while responding to shortages, sizeable new capacity was sanctioned. But in several cases, the demand outlook did not warrant capacity creation on the scale envisaged. The answer to this in many cases is to closely examine the factors leading to demand stagnation and those inhibiting the growth of healthy and viable industrial projects. Excessive taxation of some items of consumer, goods, which are treated as 'luxury', and imposition of high excise duties on intermediate and input items have led to an increase in final prices. The position is further aggravated by state level taxes and octroi. This, in turn, has resulted in restraining the growth in demand.

Also, with increased inflow of imports as a sequel to liberalisation of policy, tax-induced disparities between domestically produced and imported goods has tended to increase sometimes in favour of imports. In this context, the tax structure needs to be reformed to avoid multiple taxation and fiscal and other measures taken to encourage growth in demand.

Rationalisation of the tax structure would, in addition to raising demand, also help the export effort. If the target of 7 per cent annual growth in exports, in real terms, during the quinquennium 1978-83 is to be realised, special effort will have to be made for promoting exports both of agricultural and industrial goods. A part of the output in the coming years would have to be allocated to the export sector. This factor will have to be taken into account while planning for the increase in capacity if an opportunity for sustaining growth in several sectors, through exports, is not to be lost.

Role of Capital Market

Steps also need to be taken for fostering a harmonious growth of investment and the concomitant flow of risk



... all the sectors ... in ... of capital resources to invest-ing sectors need to be removed. For industrial projects, with their large requirement of risk capital, the problem of raising resources deserves special attention.

It is in this context that the role of the capital market in mobilising risk capital has to be seen. The potential of the capital market in *mobilising* household saving and direct involvement of the public in acquiring a stake in projects has only been partially tapped. There is enough evidence to suggest that individual investors would respond adequately if expectation of return is good.

In the past, price and distribution control policies have impaired the earning capacity of several industries. In turn, low expected profitability had a dampening effect on new investors. For other industries also, though there were no price and distribution controls, restrictions on dividend payment from time to time, either directly or through a discriminatory fiscal policy, discouraged investors. Over the years, with inflation, ideas of adequate monetary return on private saving have moved upwards. But the expected yield on risk capital has not increased. Considering the importance of mobilising household saving, through a variety of media, the role of portfolio investment needs to be viewed in a proper perspective.

Again, paucity of floating stock has also affected growth of the capital market. For mobilising household saving, the supply of scrips, with reasonable prospects of return needs to be augmented. The experience of new issues has not always been encouraging. While new scrips would continue to flow into the market, measures for augmenting floating stock through the issue of old scrips need to be initiated. One could seriously consider the manner in which a part of the capital requirements of public sector commercial and industrial undertakings could be met through the capital market. Directing such projects to the capital market would relieve Government budgets of a part of their financing commitments, enlarge activity in the capital market and augment the volume of industrial scrips. All these benefits would accrue without compromising on the investment priorities of Government or its direct control over the activities of particular undertakings.

Masterpieces inspired by Indian Dyes

KALAMKARI

KALAMKARI is an exquisite art of painting on cloth with the use of vegetable dyes. This art flourished in South India around the 14 century A.D.

Derived from 'Kalam' (pen) and 'Kari' (art) it is a superb style of fine line painting based on themes taken from Indian mythology.

The colours reflect the variegated hues of temple interiors and bear elegant witness to the skill with which Indian artisans used their limited range of natural dyes.

Indian dyes have come a long way since then.

At Atul Products we produce a wide range of Synthetic Dyes which help colour everything from fabrics of cotton, jute, wool, art-silk, and man-made fibre, to leather and paper.

Atul also produces Dye Intermediates to help make Synthetic Dyes and Optical Whitening Agents which make whites look whiter.

Every Atul Product is a masterpiece, painstakingly blended and like the ancient undying hues of Kalamkari—rich, vivid and universally appealing.

Wherever there is colour, there is a dye. Atul makes some of the finest man-made dyes.

Legacy of Bhutto

CONSIDERING the peculiar history of the relations between Pakistan and India, it was but proper that the government of India officially refrained from saying anything about the death sentence imposed by the Lahore High Court upon Zulfikar Ali Bhutto, its confirmation by the Pakistan Supreme Court by a 4 to 3 majority, the rejection of an appeal for a reconsideration of the sentence by the same court, and its eventual execution. It was clear that Zia-ul-Huq was bent upon physically removing Bhutto in order to ensure his and the army's continuation in power; it is even possible that the sentence of death was engineered and, one may argue, that the Pakistan Supreme Court's minority verdict was more sustainable in law than that of the majority; and it might be that the martial law administration has already made even the Bhutto regime, which was actually a martial law regime under a civilian guise, appear almost the very ideal democracy. But none of this warranted any interference by the government of India at the official level in what has been patently an internal affair of Pakistan. It was the people of Pakistan who secured the overthrow of the Bhutto tyranny; and the people who saw through the demagogy of Bhutto can be expected to more easily see through the bogus panacea of Nizam-e-Mustapha (rule of the Prophet) that Zia-ul-Huq is offering for the ills that bedevil Pakistan and overthrow him as well. To identify the democratic struggles in Pakistan with the personality and politics of Bhutto would be to defame such struggle, for Bhutto, as much as any other military dictator, was instrumental in throttling democracy and bringing the people of Pakistan to their present sorry pass. That in the process he also brought ruin upon his own head is altogether a different matter.

To say all this is not to ignore the reactionary nature of the military regime, or the dubiousness of its vaunted commitment to legality and the due processes of law. But the point is that such commitment to the 'due processes of law' has always been the pretension of bourgeois politicians, be they from a civilian background like Bhutto or Indira Gandhi, or from a military background like Zia-ul-Huq. It was not so long ago that another Zia in another part of the sub-continent hanged a political opponent, not because the accused had been personally held guilty of murder, but because he had led an insurrection; the 'trial' itself was conducted furtively and the sentence executed within days of its pronouncement; and yet, there was not a ripple of protest against the judicial murder of Abu Taher.

Of Zulfikar Ali Bhutto, it might be said that nothing became him so well as the way of his dying. By ignoring the many appeals for clemency and going ahead with the hanging, Zia-ul-Huq has laid the foundation for the emergence of a Bhutto myth in which the fallen Pakistani leader might well acquire the image of an ideal political leader whom the people of Pakistan were fortunate to have. Though the pro-government newspapers in Pakistan have started ascribing Bhutto's steadfast refusal to beg for mercy to his arrogant conviction that the martial authorities would never really hang him and to his being led to believe by his lawyers that 'international pressures' too would finally force Zia-ul-Huq to grant him executive clemency, it is not the image of a Bhutto, weeping and being carried away tied to a stretcher to the gallows which the Pakistan government media is trying to project that is going to take hold of popular imagination; what is more likely is that the memory of Bhutto's own crimes might fade away while the man who mounted the gallows in Rawalpindi District Jail in the dead of night is going to be remembered, in Bhutto's own overblown rhetoric, as a leader of the third world, the chairman of the Islamic Summit, the man who restored the morale of a dismembered country and a defeated people after the trauma of 1971 -- 'a poet and a revolutionary'.

That Zia-ul-Huq had good reasons to physically eliminate Zulfikar Ali Bhutto needs no stressing. That he has exploited the established institutions of Pakistan in as cynical a manner as Bhutto himself did when he was ruling the roast too admits no dispute. That in this endeavour, he was ably assisted by the ideologues of the Jama'at-e-Islami too is self-evident. But what is significant is that the subversion of State institutions to settle personal and political scores and the militarisation of politics actually began under Bhutto himself. Zia-ul-Haq is entirely the creature of Zulfikar Ali Bhutto, not merely in the sense that it was Bhutto who promoted him to the position of Chief of Army Staff over the heads of several other senior officers, but the system of martial law government which Zia has been presiding over was taken over almost entirely undisturbed from the one that existed under Bhutto. Even the 'Islamisation' of politics under Martial Law — the so-called Nizam-e-Mustapha

with the promised Nizam-e-Islam to follow — has only been a more purposeful continuation of measures introduced by Bhutto himself in the last days of his power, in an opportunistic move to appease the orthodox elements forming part of the Pakistan National Alliance with a view to splitting the opposition. If finally the army and the mullahs have successfully combined to eliminate Bhutto, the foundation for such an alliance was laid by Bhutto himself who even led it briefly; but as happens so often, the monster he created has devoured its creator.

It is necessary to recall some of these less savoury aspects of Zulfikar Ali Bhutto's personality and career, for in the undoubtedly genuine grief felt by many about the cruel end of a talented and clever politician who, occasionally, even showed signs of statesmanship, one might overlook the object-lessons Bhutto's life and death hold for any underdeveloped country and its people. Bhutto belonged to the classic lineage of leaders that these countries in Asia, Africa and Latin America have thrown up in the last half a century whose careers present a glaring contradiction between the promises they held forth and the actual legacy they left behind.

While employing demagogic rhetoric and gathering mass support, Bhutto was at the same time also fashioning alliances with repressive and reactionary institutions precisely with a view to contain the expectations he had himself roused; by definition, such a balancing act could not last long. That he finally met a fate far more grim than what has been the fate of many other leaders in the underdeveloped countries has been due to certain incidental factors, including possibly his actual culpability in the murder for which he was hanged, and also the tremendous self-assurance the man undoubtedly had in that four years later, he still left enough evidence of such culpability to enable his opponents to present a reasonably credible case before a court of law.

The Law

Imprisonment without Trial

LARGELY following a sustained campaign in the columns of *Indian Express*, attention was drawn recently to the question of the very large number of so-called undertrials who spend long periods of imprisonment in jails all over the country even before their cases come up for trial. The Law Commission too has devoted its seventy-eighth report, just released, to the subject of "congestion of undertrial prisoners in jail".

According to the Law Commission's report, on January 1, 1975 there were 2,20,146 prisoners in jails in India. Of these, as many as 1,26,772, or 57.6 per cent, were undertrial prisoners. In other words, the majority of those imprisoned were those whose guilt had yet to be proven. The Law Commission also collected some statistics of undertrial prisoners in selected central jails as on September 1, 1978. These present an even more appalling picture In the Central Jail, Ambala, out of 254 prisoners, the number of those who had been convicted and who were undergoing any sentence of imprisonment was only 23. Thus 90.9 per cent of the prisoners in the jail were undertrials. In the Central Jail, New Delhi, out of 2,373 prisoners, only 267 were convicted persons undergoing sentences of imprisonment The proportion of undertrial prisoners here was thus 88.7 per cent.

In effect what this means is that it is possible for the administrative and police authorities to arrest anyone, charge him with certain offences and, without infringing the due processes of law in any manner, keep him in prison for many months or even longer This is not just an abstract possibility, but something which happens again and again every single day of the year to large numbers of the poor in our villages and towns who have the misfortune of falling foul of the rich and the powerful

The large number of undertrial prisoners in Indian jails belong to one of the following three categories

(a) Persons charged with non-bailable offences, in respect of whom the courts have declined to pass orders for their release on bail

(b) Persons charged with non-bailable offences in respect of whom the courts have passed order for bail but who, because of the difficulty of finding appropriate surety or some other reason, fail to furnish bail bond.

(c) Persons charged with bailable offences, but who, because of the difficulty of finding appropriate surety or some other reason, fail to furnish bail bond.

It is a pity that the Law Commission fails to say how many undertrial prisoners in the country as a whole belong to each of the above categories. It is, however, certain that a significant proportion consists of those charged with bailable offences who ought to be released on bail as a matter of right. Statistics for the Central Jail, New Delhi, for instance, show that out of 2,106 undertrial prisoners as on September 1, [illegible] charged with [illegible]

The Law Commission's report is, of course, a most genteel document and it calls a spade anything but a spade. Nevertheless, it is possible to infer that if at any point of time more than a hundred and twenty thousand persons are imprisoned without trial in our jails, the reasons are largely, first, in the case of those charged with non-bailable offences, the tendency of the judicial authorities to use their discretion in the matter of grant of bail against the accused and in favour of denial of bail; and, second, in cases of bailable offences and of non-bailable offences where bail is granted, the inability of the accused to furnish the stipulated bail. The latter situation, in turn, is attributable as much to the poverty of a large number of the accused, as to the tendency of the judicial authorities to set the bail amounts high and to insist on sureties instead of releasing the accused on personal bonds.

These tendencies have a great deal to do with the basic attitudes of the judicial authorities when dealing with poor people, including those driven to petty crime by poverty and the lack of anything remotely resembling secure employment, as also with the extent to which the judiciary at the lower levels is subject to the influence of the police and the administrative authorities. That being the case, the Law Commission's recommendations — such as enlarging the list of bailable offences or urging the judiciary to observe the statutory requirement that the amount of bail bond shall not be "excessive" and to use its discretion more liberally to release accused persons on personal bond without insisting on sureties — cannot be expected to go very far The imprisonment of large numbers of poor people for long periods of time on relatively petty charges has to be accepted as yet another aspect of the inhumanity of the present social and political system, and the many-sided oppression which is the lot of the poor within it, and it is futile to seek to change this fact of life by changing the definition of bailable offences or tinkering with the rules governing grant of bail.

Politics

Pace of Realignment

Mohan Ram writes:

WHAT might turn out to be Indira Gandhi's last attempt at retrieving the political initiat ve before the scheduled 1982 general elections is in the

official [illegible] Youth Congress wing of her party with complete financial autonomy and with Sanjay Gandhi at the helm, and the move for a march on Parliament on May 16 with a charter of demands are part of the strategy. The fight is not to force a realignment of forces to bring the Janata government down before it completes its normal five-year tenure; it is against what she views as the political vendetta against her, her son and her Emergency lieutenants.

After breaking away from the Congress at the beginning of 1978, Indira Gandhi could win for her new party the states of Andhra Pradesh and Karnataka and a share (even if short-lived) of power in Maharashtra, at the March 1978 elections to state assemblies. Rattled by her show of strength a section of the official Congress fell for the unity moves which, after nearly a year's tortuous parleys, have now collapsed because Indira Gandhi wanted a united Congress to save her from the consequences of the Special Courts Bill. Meantime, the fiasco of her Save India Day (August 9) had convicted her of the need to enter Parliament to secure first the liquidation of the rival Congress and, later, the disintegration of the Janata party. But her Lok Sabha tenure ended within weeks of her election from Chikmagalur and with a week in prison.

The landslide of defections to her party from the rival Congress and the break-up of the Janata coalition she had expected have not materialised. While she seems reconciled to the continuation of the Janata government for the rest of its tenure, she is concerned with the fate of her party if she were to land in prison before the 1982 elections. With her political status she is assured of fair treatment in prison; but the same may not be the case with Sanjay Gandhi, who is supposed to have quit politics. The exercise of relaunching Sanjay Gandhi as the leader of the Youth Congress, ostensibly to fight the RSS challenge, is aimed at securing for him some political status so that he is not treated like a common criminal if and when he goes to prison.

But the relaunching of Sanjay Gandhi has had its adverse impact in her own party. The main opposition to it has come from Devraj Urs, the Karnataka chief minister who incidentally is being charged by Chenna Reddy's following in neighbouring Andhra Pradesh with trying to promote a lobby for himself in the Andhra Pradesh Congress(I). Devraj Urs has also [illegible] has even welcomed his Kisan budget. In contrast, Chenna Reddy is helping the relaunching of Sanjay Gandhi by staging a three-day Youth Congress camp at Nagarjunasagar in the first half of April.

With the collapse of the Congress unity moves, two distinct approaches at securing a realignment of forces are emerging. One is reflected in the Chandra Shekhar-Y B Chavan entente which aims at a Janata-Congress united front to meet Indira Gandhi's challenge on the streets, expected to begin with the projected May 16 march on Parliament. The lumpen urban youth who constituted the Youth Congress stormtroopers during Emergency are to be hired again — which is the reason why the revived Youth Congress had to be assured 'financial autonomy'. The secret funds earmarked for the political rehabilitation of Indira Gandhi and Sanjay Gandhi will surface through the Youth Congress.

Another line is reflected in the CPI's new posture. Its outright but belated condemnation of Indira Gandhi while supporting the Special Courts Bill came in wake of Alexei Kosygin's visit during which he avoided a political meeting with Indira Gandhi. The CPI's shift is intended mainly to appease the CPI-M with which it is desperately seeking an alliance in Kerala. Together with the CPI-M and the Congress third force (comprising Chandrajit Yadav, Priya Ranjan Das Munshi, A K Anthony and the like), the CPI thinks it can work on the progressive elements in the Janata party to bring about a new compact — a third force not aligned to either of the two Congress parties or to the Janata party. This suits the CPI-M fine because heading a winning combination in Kerala at the next elections is its almost sole political objective now.

The emergence of a sizeable pro-Soviet section in Janata party is another significant development. The pressure on the government for a strident policy towards China and for the recognition of the Viet Nam-installed regime in Kampuchea comes from a lobby which includes this section of the Janata party. The CPI is masterminding the operation and is happy to have established new bridges with the ruling party. It does not seem to regard the whole of Janata party as a threat on par with Indira Gandhi. Alongside, the CPI-M which at one stage regarded the whole of the Janata party as an ally in the fight to prevent the return of authoritarian tendencies has been [illegible] equivocating on this issue.

The pace of the realignment of forces depends on the speed with which the government can bring Indira Gandhi to trial and complete the judicial process and act upon the outcome of the prosecution. It also depends on the possible impact of the movement she is planning to launch on May 16, before the budget session of parliament ends.

Sugar

Tight-Rope Walking

THE 1978-79 sugar season is now 24 weeks old. The final figures for the 1977-78 season show that area under sugarcane had increased by 12 per cent and cane production by 18.5 per cent. According to the first crop estimate for the current season, issued on November 13, 1978, area under sugarcane has increased further by 5 per cent. Small increases in area have taken place in Bihar, Haryana, UP and Maharashtra and the crop was reported to be progressing well in most parts of the country. The first estimate covers 90 per cent of the area finally reported. Bearing this in mind, it can be safely said that the sugarcane crop this season will exceeed 190 million tonnes. On the basis of the experience of the last two decades it can be assumed that at least one-third of the cane crop will be crushed by the sugar factories. This gives a likely level of sugar production of about 6.3 million tonnes in the current seanson.

By successfully generating a crisis atmosphere all over the country, industry has managed to secure quite a few facilities from the government such as easy credit and the creation of a buffer stock of 5 lakh tonnes to be raised to 1 million tonnes, if necessary. In addition, from March 1, 1979, industry has been allowed to voluntarily restrict monthly sugar releases. The release for March was 4.5 lakh tonnes. As a result of these measures, the price of sugar has been pushed up to Rs 2.80 per kg. Wise management by government can certainly prevent any further increase in prices by compelling industry to release a sufficiently large quantity of sugar every month. On March 12 the Minister of State of Agriculture, B P Singh, assured Lok Sabha that government would not interfere with sugar prices so long as the interests of sugarcane producers and sugar consumers were safeguarded. The government is known to have indicated that it regards a price of Rs 2.75 per kilo as the ceiling below which sugar prices

should rule in the home market. In view of this the government has released an additional 40,000 tonnes for the current month.

In 1978 government exported 6.47 lakh tonnes of sugar. This cost the government Rs 33 crores by way of subsidy to the industry. The government has stated categorically that it would not subsidise sugar export in 1979. By February end, government had contracted for export of 1.92 lakh tonnes but had shipped only about 5,000 tonnes. As an incentive to export, government has permitted industry to export directly under advice to government. In spite of the International Sugar Agreement, throughout 1978 the world price remained far below the floor level of 11 cents per lb. Even at the time of writing it is around 8 cents. Since the cost of Indian sugar is high, export prospects are bleak.

K C Chatterjee

S K B writes:

K C CHATTERJEE, whose sudden death at the age of 65 in the early hours of March 28 in Bombay came as a shock to the large number of his friends, has left his deep impact on the country's pharmaceutical industry and on education and training in pharmacy.

A Fellow of the Pharmaceutical Society of Great Britain, Keshav Chandra Chatterjee — 'KC' even to those who could claim only relatively slight acquaintance with him — retired as Director, Research and Development, of Boots (India) in 1965. He had been instrumental in persuading Boots, England, to start basic manufacture of insulin in India and if today the country is self-sufficient in the production of insulin, albeit from imported pancreas, this is thanks largely to KC's pioneering efforts and perseverance.

As an independent consultant, after his retirement from Boots, KC made valuable contributions to the development of the pharmaceutical industry, the small and medium sector of it particularly. He was responsible for designing a number of small and medium scale pharmaceutical units which, without needless over-emphasis on sophistication, conformed to exacting standards of good manufacturing practices and quality control. In recognition of his outstanding services K C was awarded the Acharya P C Ray Gold Medal in 1974.

His retirement from Boots also gave KC the opportunity to devote himself to raising the standard of education in pharmacy. As a member of the Pharmacy Council of India, he had a big hand in formulating the Diploma Course in Pharmacy under the Pharmacy Act. He was also among the first to realise the need for changes in the pattern of pharmacy education and training in order to meet the changing needs of the country. KC was founder-principal of the Bombay College of Pharmacy, which was planned and executed by him in its minutest detail. He dedicated himself heart and soul to giving the College a structure, shape and character which will stand as a lasting memorial to his abilities as an educationist, as a pharmacist and as a visionary.

KC was an occasional, mostly anonymous, contributor to this journal on issues concerning the pharmaceutical industry. His clear-eyed assessment of the role of the multinational pharmaceutical companies, his faith in the country's basic capability to develop a national drug industry as well as his deep dissatisfaction with the present state of the industry are all reflected in the following brief extract from an article he wrote in 1976 :

> It is tantalising to speculate what would have been the state of the [pharmaceutical] industry in this country if the multinationals, by some fortuitous circumstance, had not made their debut here. India is not a country which did not have a pharmaceutical industry. Even in the days prior to the advent of the new drugs, the so-called 'wonder drugs', it did have a nucleus of a drug industry and, within the constraints imposed by an alien rule, had some wonderful achievements to its credit, particularly in the field of sera and vaccines. During the last war it had met most of the defence and civilian requirements, unaided by any foreign firm or even imported raw materials. Would India have been starved of the 'wonder drugs' or would it have had to import all of them all the while or would indigenous talent have somehow managed to meet the most essential needs of the country, devoid of the sophistication currently associated with the drug industry? Would a Bhabha not have emerged, as in the case of atomic energy? These are all speculative questions but the odds are that the country would have been more self-reliant, would perhaps have had more of indigenous medicines and would perhaps have developed more of sera, vaccines and other prophylactic medicines for which sophisticated technology has existed in the country for more than 50 years. The two public sector undertakings, IDPL and HAL, would have been expanded much earlier and, above all, the country would have been more selective in its choice of drugs in contrast to the state of chaos existing at present and would have learnt to stand on its own legs. In that case, the multinationals would have had no occasion to play the good Samaritans.

KC was a member of the Development Council for Drugs and Pharmaceuticals, the Indian Pharmacopoeia Committee and the Pharmacy Council of India and a Director of the public sector Indian Drugs and Pharmaceuticals Ltd.

For all that, there was so much more to KC than his deep involvement in the pharmaceutical industry. His many-sided talent expressed itself in music, painting, photography or just conversation. It was impossible not to be struck by the grace and elegance with which K C did the most ordinary things.

KC leaves behind his wife, Susheela, and a son.

China and Viet Nam

WHILE your editorial note "China and Viet Nam" (March 3) is convincing in its simple and straightforward analysis of the situation in Indochina, the article by GPD only obfuscates the real issues. GPD calls the present Chinese leadership "Han chauvinist", "revisionist" and "adventurist" at various places in this article. He even equates the Soviet intervention in and continued occupation of Czechoslovakia and the Soviet-backed Vietnamese occupation of Kampuchea with the Chinese counter-attack in Viet Nam. According to him, "not all these cases are identical... but the basic fact is the same".

GPD claims that Mao would have understood the significance of Viet Nam and comes out with the story of the old Buddhist temple and the four abbots Mao did understand Viet Nam and its leadership when he told a Vietnamese delegation in late 1975 that the people who fought against imperialism but do not fight against social imperialism will have to make another revolution in their country. However, Mao did not live to see the Vietnamese leadership sitting in the lap of social imperialism, enjoying its favours and acting as its pawn in Asia

The Chinese do not want to alter the situation in Kampuchea by the counter-attack, as maintained by GPD A statement by Chen Chu dated March 12 makes this clear: "Viet Nam's massive armed aggression and military occupation of Democratic Kampuchea is a question entirely different in nature from China being compelled to make limited counter-attack in self-defence as a result of wanton provocation of border conflicts on the Sino-Vietnamese border by the Vietnamese authorities. The former is Vietnamese aggression against Kampuchea constituted a gross violation of UN charter... the latter is a necessary action in self-defence taken by a sovereign state in accordance with the Article 51 of UN charter. Any attempt to confuse the two and treat them equally only serves to confound the right and wrong and condone the real aggressors" (*News from China*, March 21). This precisely appears to be GPD's intentions. As to "altering the situation in Kampuchea", it will be done by the people of Kampuchea themselves who are presently engaged in a war of liberation against the Soviet-backed Vietnamese occupation forces.

Finally, I agree with your concluding remark that the present tragic events taking place in Indochina are "the inevitable consequence of the Soviet Union's efforts, successful so far, to step into the shoes of the defeated United States and to emerge as the dominant superpower in the Indochina region".

LAJPAT RAI

Delhi
March 20

Automobile Industry and Social Responsibility

THE Union Minister of Industry, George Fernandes, has criticised the automobile industry for neglecting research and development activity. But what is even more regrettable is the industry's indifference towards its social responsibility. Consider, for instance, the case of Hindustan Motors.

This is the largest automobile factory in India. It employs nearly 16,000 persons. It has been in existence for about 30 years. But it has not made arrangements for the education of the children of its employees.

These children have to come daily from Uttarpara (where the factory is situated) to Calcutta, covering a distance of nearly 40 miles both ways. The children leave the colony at about 7 in the morning and return home between 6 and 7 in the evening. The factory has provided three buses for the transport of the children. But these buses are inadequate. They often break down, causing tremendous hardship to children and anxiety to their parents. It is amazing that Birlas have not thought of building a high school in the colony for which there is plenty of space.

Sales of Hindustan Motors in the year ended June 1978 totalled Rs 102 crores. Despite the hike in the price of petrol and in the excise duty on cars, the factory is bound to make more profits in the coming years. But it is a sad thought that the management has done nothing to alleviate the hardship caused to hundreds of children because of the lack of facilities for education in the Hindustan Motor colony.

C K MUKHERJEE

Uttarpara
March 20

Progressive Democratic Lawyers' Association

A CONVENING committee has been formed on February 10, 1979 at Hyderabad for the formation of a Progressive Democratic Lawyers' Association with P Venkateshwarlu, advocate, as Convenor for the following objects:

(1) To protect and propagate civil liberties among people.

(2) To help the people in their struggles for their rights.

(3) To review legislation and suggest suitable amendments in enactment and practice.

(4) To hold seminars, conferences and symposiums for the above purpose.

(5) To strengthen the democratic movement in the country.

(6) To publish magazines, journals, acts in Telugu.

The meeting decided to hold its inaugural conference in the month of April at Hyderabad. The meeting also adopted the following resolutions unanimously:

(1) AP Suppression of Disturbances Act, 1948, should be repealed forthwith.

(2) All political prisoners, including Naxalite prisoners, should be released and all cases against them should be withdrawn.

(3) In commemoration of late Shri Ravi Subba Rao, advocate, who championed the cause of civil liberties and democratic rights, memorial lectures would be arranged by this Association every year in the month of December

The Convenor invites all the advocates in the state to join this organisation to work for the above objects

P VENKATESHWARLU

Convenor,
Progressive Democratic Lawyers' Association,
H No 4-7-220, Esamiabazar,
Hyderabad.
February 20.

Cong (I) Crisis

Romesh Thapar

IF the ruling Janata Party has become synonymous with disarray, disaffection and despair, the party of which Indira Gandhi is the supposedly undisputed leader is in the doldrums. Mama Gandhi wants son Sanjay to be dressed up as a *neta* because she has been persuaded that this is the only way she can save him from a miserable future in jail. The entire so-called Cong(I) is being rocked by this mafia gambit.

The gambit has been developing over several months The build-up of the criminal cases against Sanjay Gandhi, and the GOI's lazy and intolerable acceptance of Cong(I) goondaism even within courtrooms, encouraged the notion that it is possible to neutralise the impact of criminal charges by demonstrations in the streets and symbolic jail-goings. Even the stage-managed 'upsurge' at the time of Indira Gandhi's jailing is used as an argument about the efficacy of the new agitational line.

Sanjay Gandhi, since the end of the Emergency, has been careful to operate behind the scenes. Only the inner caucus was taken into confidence, and this caucus includes publicists who prefer the son to the mother. The more open and desperate moves to give Sanjay the trappings of a *neta*, paralleled by his conviction in the *Kisa Kursi Ka* case, appear to have startled the Congress dumb-wits who were working for what they euphemistically call 'unity with Indira Gandhi'. The prospect of going to jail in solidarity with Sanjay was disturbing even to the elements gathered around the Cong(I).

Several weeks ago, having successfully prevented a whole regiment of *dadas* from the old Congress from swamping out his trusted cheer leaders, Sanjay Gandhi suddenly became active. From the news trickling through the conspiratorial atmosphere of the Cong(I), not only are the Chief Ministers of Karnataka and Andhra Pradesh made to realise who is boss, but the lesson is driven home to the satraps in other states where the party is nowhere near the levers of power. Very soon the country will be asked to accept Sanjay as the heir to Indira Gandhi, whatever that may mean.

The compulsions behind these developments have put the future of the Cong(I) in jeopardy, or at least its prospects of becoming the kind of party it was trying to be. The pushing into 'leadership' of Sanjay Gandhi, even under the cover of what is known as the 'Youth Congress', must inevitably condition the character of the Cong(I). The roughs and toughs gathered around the son will soon reduce mama to a totem. For their part, they are convinced that the people of this country are just waiting for their guidance and rulership.

It is against this background that Sanjay Gandhi launches his confabulations with Raj Narain on the Jan Sangh/RSS threat He must have a lurking admiration for the former Health Minister, but it is doubtful whether Raj Narain gains from the contact. However, the attempted polarisation of Indian politics on the question of the RSS and its links with the Janata party is not going to proceed at the level of the mobsters. Many serious and profound issues of policy and perspective are involved in a realignment of Indian politics It cannot continue as a familiar game of musical chairs.

The repercussions of the Uttar Pradesh Janata party crisis are being studied more carefully. In addition, the talks between Chandrashekhar and Chavan in Bombay on a possible Janata-Congress collaboration, the ideological rifts within the Janata leadership brought to a head by Madhu Limaye and George Fernandes, and the creeping crisis in administration now fully corroded by corruption and cynicism, are sketching a scenario which will demand a major shake-up of ideas and concepts. For a quiet beginning, it would be appropriate to study the way various parties are digging in at various points on the sub-continent. This jig-saw of political strength and weakness has to find a participative democratic frame at the Centre.

Significantly, the Rajya Sabha has passed the bill for a special tribunal not as a proposal expeditiously to deal only with the crimes of the Emergency, but as a new constitutional structure to curb the misuse of power by leading politicians and bureaucrats. The consensus around the bill isolated the authoritarians and reinforced the democratic sentiments of our society. This is not to suggest that the battle is won. Far from it. The gangster politician, interested only in expanding his power to get rich quick, is pushing his way into every party — for a political career is the best insurance There are too many of these gangsters around, even at ministerial level, for us to be complacent.

Another healthy development was Bhupesh Gupta's statement on behalf of the CPI admitting frankly that his party had been mistaken in supporting the Emergency and Indira Gandhi's destruction of the democratic frame This declaration so soon after the advice reported to have been given to sympathetic Congressmen by the CPI's international operators to work for the unity of the Congress party under Indira Gandhi, suggests that some fundamental re-thinking is under way Could it be part of the reconsiderations following the Chinese attack on Viet Nam and the visit of the Soviet Prime Minister Kosygin?

The CPI's muddled approach to events could be ending — and despite S A Dange's fawning before Indira Gandhi The other day, the party staged a most impressive rally of agricultural labour and poor peasants — a rally comparable to anything put on by Charan Singh's BLD. Any day now we expect the CPI(M) to bring the kisans to town. In fact, in the Capital every day is some sort of 'Day'. I am sure that all this activity is very costly and requires generous donations. If the politics are self-reliant, then surely this country has plenty of money for agitation. Here's a whole new field for our statisticians to graze on!

INTERNATIONAL AFFAIRS

One Battle in a Long War

G P D

"I am an old man and my ears aren't good. I can't hear anything you are saying." Deng Xiaoping to his critics on April 18, 1976.

IT is relatively peaceful now in our country. The series of 'condemn China' meetings jointly organised by the most unlikely people in the most unlikely company seem to be over. The euphoria over Kosygin's visit is also over. All is quiet on our progressive front. The suffering of Viet Nam or for that matter of China was never an issue for them. 'Condemn China' was the motive. The Chinese folly, suffering of some socialists on both of sides of the Sino-Viet Nam frontier and elation at all this by our socialists have been the marked features of the entire compaign. Now it is over, and it is time perhaps to take a second look at the hostilities.

It is clear by this time that what has happened so far is not the whole story It is only a battle in a larger war. It may be too early to say who has been mauled and who has been the victor. The plain and the painful fact is that the war is not yet over. It is also not quite true to say that the Vietnamese regulars did not join the war. At least one of their crack divisions was involved in the war. It is also a fact that the Vietnamese did withdraw about 30,000 men from Kampuchea. The moral is clear, or at least should be. It is going to be a protracted war, the outcome of which cannot be judged in terms of the casualties suffered. What is more important is that both the parties to the conflict are old masters of the guerilla-game. It would be foolhardy to predict the outcome of the war on the basis of one battle.

The reality is that a protracted war has begun. In a protracted war casualties in a single battle do not tell anything, except that conflict will go on. The negotiations have not begun because the Vietnamese are saying that the Chinese withdrawal is not complete. This means that it is not yet time for negotiations. Of course, the war will have to go on; by other means perhaps, but it has to go on.

The Chinese have made two points, no doubt at enormous cost. The Sino-Vietnamese border is now active and may remain active — again at enormous cost — for an indefinite period. Second, the Vietnamese will have to recognise, today, tomorrow and day after that the Chinese can continue to apply pressure almost endlessly 'till such time as the futility of the Soviet involvement in Indochina is crystal clear. Vietnamese intervention in Kampuchea was Soviet intervention. The Laotian government is increasingly behaving as a partisan on the Soviet-Vietnamese side in the Sino-Soviet cold war. The Chinese are not going to take it. No matter how long it takes, no matter what the costs are, the war against the the Soviet encirclement of China will go on. This time, and the first time in their history, the Vietnamese are fighting with an enemy who knows as much about the techniques of 'protracted war' as they do. The long-term objectives are clear : the Vietnamese should know that, as a Chinese proverb has it, water at a distance is no solution to the problem of fire. The Soviet armed might is scarcely the solution for anything. It is, in any case, useless against continuous pressure. That the Soviet Union is a superpower means two things. One is that it can threaten, can occasionally bring about a military coup and so on. The other is that, and perhaps this is relevant here, it would be very vulnerable against a battle of nerves It cannot cope with continuous military pressure. The Americans had a similar problem. The Soviets may have the same awaiting them in Indochina.

By this time, hopefully, all illusions in this country about similarities between 1962 and 1979 would have disappeared. What is happening in Indochina is very much a protracted conflict. One does not have to share the Chinese view of the world to see what they are aiming at in Indochina over a period of time. At any rate, the developments over the past few weeks have made it clearer. The Chinese are shouting from the housetops. So are the Vietnamese and the Soviets, to be sure. What is it that these peoples have said and what does it mean?

(1) The Vietnamese intervention in Kampuchea and the resultant downfall of Pol Pot was a Soviet-inspired and aided move.

(2) The government in Laos is the next actor on the scene. It is taking an increasingly anti-Chinese position in the not-so-cold war in Indochina. The Soviet-Vietnamese version talks about the Chinese massing troops on the China-Laos border.

(3) The question, therefore, relates to the Soviet presence in Indochina — a presence which for security and other reasons is unacceptable to the Chinese.

(4) The Chinese appear to be prepared to activate the Sino-Vietnamese and the Sino-Laotian borders to keep up pressure, typical of "protracted war" tactics, on the China-Indochina frontier.

There are two further aspects of the problem. The first is that the Chinese had not reacted so actively to their own encirclement earlier. Now they have. A government normally very conservative and cautious in military intervention, is unlikely to get involved unless it is quite ready for a 'protracted conflict'. Readiness here would presuppose a view of this war as a part of the war-negotiations-war syndrome against a superpower the (the Chinese would say an imperialist power). It is for this reason that the Indochina conflict threatens to be sordid and frightening. Secondly, the 'restraint' that the Soviet Union has shown — as some of its friends would describe its treatment of the conflict so far — will be tested over a period of time. One does not know exactly what the difference between 'restraint' and 'weakness' is. The Chinese will be interested in demonstrating that the Soviet Union is not a dependable ally; more particularly so because it has simply over-extended itself all over the world. What is restraint in a battle can be turned into a weakness over the whole period of war. The Vietnamese and the Chinese as well will pay a very heavy price for it. But the point can be made.

All this is a high drama of power. And when a power drama is enacted, the actors shout. What is worse is that the Chinese and the Vietnamese and the Laotians and the Kampucheans are not listening to each other at all. All of them are listening to everybody else except the direct adversary. This has been the fate of Asia and the Asians ever since the Second World War. One would have thought that the Asian socialists would be different. Obviously they are not. In the meanwhile, the guns boom. "I can't hear you" politics goes on. And, of course, people die. But who cares about them when the war is on?

BIHAR

Containing the Jharkhand Movement

A S

IT is well over 18 months since the agitation for a separate Jharkhand state began on a united front basis. In the beginning, at least half a dozen committees had made a confounding appearance; even leaders like Kartik Oraon, a former Congress MP, who had politically survived on the anti-separation plank, were found vociferously advocating Jharkhand nationalism. But such elements have retreated and there is now only one committee to stand in the field; the other, led by Janata ministers and legislators, is of little consequence. The united front which is tenaciously carrying on is the nine-party committee comprising the Horo-led Jharkhand Party, Marxist Co-ordination Committee, Jharkhand Mukti Morcha, CPI-ML (SNS), Birsa Seva Dal, Jharkhand Muslim Morcha, Hul Jharkhand, Revolutionary Socialist Party of India and the Congress.

Historically, this is the second era of the Jharkhand movement; the first (1939-1963), which was led by Jaipal Singh ended with the integration of his Jharkhand party with Congress on the 'advice' of Nehru. There is a world of difference between the two eras. In the first the tribals knew and relied upon only one organisation, Jharkhand party, and even more so, upon only one leader, Jaipal Singh. Today, there are at least 20 leaders, all important in their areas, however small. The single organisation Jharkhand party has split into a dozen groups, all interestingly, wedded to nationalism. In the first general elections, the Jharkhand party won 23 of the 34 scheduled tribe reserved seats. Today, the revived Jharkhand party, led by N E Horo, has only one MLA, and that is Horo himself. The other groups have none.

While the organisation has been shattered beyond redemption, Jharkhand can on the other hand boast of many changes in the new era. In the old one, the movement was fought only on paper. As Horo says, "that was a war of memorandums". There were occasional demonstrations no doubt. But never in the 24 years (1939-63) was any effort made to drive home the point by mass struggles. In the second phase, the movement has been two-dimensional; political battle for a separate state and economic war against the exploiters. Many of the organisations now forming the 'Alag Jharkhand Rajya Samyukta Morcha', like the Jharkhand Mukti Morcha, the Marxist Co-ordination Committee, Birsa Seva Dal and, of late, CPI-ML(SNS), have been organising economic and social struggles in their areas of influence. It is because of the mass bases of the parties of this united front that the state is so scared of the Jharkhand movement, much more than Nehru or the then Congress leaders might have been of Jaipal Singh-led agitation.

None of the organisations, not even the Jharkhand party, is in great haste to get a separate state. The reason for the revival of the movement, according to Horo, is to help the oppressed train themselves in mass struggles. Shibu Soren, the general secretary of Jharkhand Mukti Morcha, has a similar view: "Even if Jharkand does not come into being in my lifetime, why should I be bothered ? Our first concern is to chase away the blood-suckers and help the people lead a respectable, quiet and fraternal life." According to A K Roy, the leader of Marxist Co-ordination Committee and Colliery Kamgar Union who is experimenting with the application of Marxism-Leinism "in its true spirit" in Dhanbad area, the Jharkhand movement is important because "the emancipation of the working class is impossible unless it is linked with the aspirations of the subjugated nationalities of Chotanagpur". It is clear that if Jharkhand comes into being, these organisations, which will then form the government, will take steps to 'liberate' the people from the exploiters. But it is so that until Jharkand is attained, the 'liberation' should be postponed; what they would do as the government, the organisations are doing meanwhile, by mass struggles. That is where, as already pointed out, the current movement radically differs from Jaipal Singh's agitation.

To sum up, the current movement is basically for a political Jharkhand, and not for a territorial Jharkhand, though this aim is never to be lost sight of. This is proved also by the latest trend of the movement to take into its fold also the adivasis of 'Utaranchal' (North Bihar). A committee called 'Uttaranchal Bhartiya Adivasi Sangharsh Samiti' has recently been formed, under which banner the adivasis of Katihar, Purnea and other north Bihar districts are to organise themselves against the oppression of the landlords, moneylenders and the police. North Bihar is not to come within the boundaries of the proposed Jharkhand; and yet the leaders of Jharkhand nationalism have chosen to organise the adivasis in that area. The organisation came into existence in the wake of murders, rapes and pillage by landlords and police in Katihar and Purnea districts. In Katihar, the landlords had raped a ten-year adivasi girl. For the first time, on March 21, organisations supporting separation of Jharkhand had led a demonstration and a rally in Patna. The 30-point charter of demands that the demonstrators submitted to the state government concerned itself mainly with the atrocities against the poor in Chotanagpur and north Bihar. The demand for a separate Jharkhand state was 23rd on the charter.

No doubt, in the last 18 months, as also on every February 4 (Jharkhand Divas) since 1974, meetings have been held to reiterate the demand for separation. Hunger strikes, sit-ins, rallies, intellectuals' conventions and bundhs have been organised everywhere. District committees of the nine-party united front have been formed. In the beginning, the Jharkhand party also regularly submitted a memorandum to the Prime Minister. While all this has gone on, the main constituents of the united front have laid the real stress upon the work among the people. From a talk with their leaders it appears for certain that they have completely lost faith in petitions to the government or announcements by the government. Even when they hand over some charter to the government, they fully re alise that they are merely doing a formality.

The emphasis has been on real work, on militant, economic struggles, than on the campaign for statehood. Since the Janata party came into power, there have been four highlights of the economic movement: agitation against afforestation policy in Singhbhum, agitation against forest product purchase policy in Ranchi; agitation to reclaim the land grabbed by moneylenders in Santhal Parganas; and agitation against public sector projects under construction in Singhbhum and Ranchi. All these issues have seriously affected the lives of the original inhabitants; their economy and social life have been

shattered. [illegible] issues saw masses of people organise in the area on a wide scale.

In Singhbhum, the struggle was against the planting of teak trees in place of sal. Apparently, teak afforestation was intended to help any sections of society but the adivasis. Sal is a tree whose every bit—roots, skin, leaves, flowers, fruits and trunk— is used by the adivasis for food, extracting oil and so on. Forest, particularly the sal, is half the adivasi economy. The adivasis argued that the government could, if it desired, plant teak in empty lands: why was it uprooting the sal trees to substitute them by teak?

But policies for forests are laid down by the timber contractors in league with the forest officers. It is they who decide which trees are to be felled and which to be planted. In every district, the contractor-officer league has been denuding the forests at its will. If the government grants a contract for felling trees in ten hectares, the contractor denudes a hundred. When the adivasis started felling teak trees in Singhbhum, the contractors and forest officers were only too happy. They could now point the accusing finger at the adivasis, where as they themselves had in the past illegally cut the timber. Forest minister Lalit Oraon, came out with a ready estimate; the adivasis have 'destroyed' trees worth Rs 5 crores! Clearly, the management of the 'nationalised forests' takes the adivasis nowhere into account. For whom the forests exist and grow and vanish can be seen by the entry of the Swedish International Development Authority into Chotanagpur with the promise of an aid of Rs 45 crores to Bihar for 'community forestry'—a programme designed to use each adivasi family to grow trees.

In Ranchi, particularly in its Simdega sub-division, there was a mass fury consequent upon the government take-over of the trade in oil seeds, mainly of Kusum and Mahua (see 'Resurgent Adivasis', EPW, September 9, 1978). The purchase, after the take-over, was entrusted to the state forest corporation, with a view to "eliminating middlemen". The corporation appointed three agents to buy from the adivasi hats; two of them were traders of Simdega and the third, a local ex-raja. But there was no buying done even six weeks after the take-over. The adivasis, solely depending on the sale of oilseeds to have cash for buying some food, had to starve.

In Santhal Parganas, the biggest-ever campaign was mounted by the Jharkhand Mukti Morcha for repossession of plots fraudulently usurped by the moneylenders, traders, and landlords. The struggle was well-timed with the harvesting of paddy crops last Kharif. Called as 'dhankatni andolan' (paddy-harvesting campaign) the struggle saw the adivasis, harijans and backward castes cut the crops from their land illegally or legally grabbed by the moneylenders. This campaign created a great sensation in the whole of Santhal Parganas, resulting, as it was intended to, in hundreds of clashes. The struggle was launched as the legal machinery had completely failed to help the poor inhabitants made landless.

The forth highlight of the economic movement in the area has been the mass opposition to the pattern of 'development' which had completely dispossessed the original peasants. At Kamdara in Ranchi, where the Koel-Karo river valley project comprising two big dams and four power stations was in progress, the adivasis put up barricades so that no lorries could reach the site. In Chandil area of Singhbhum, where the Subarnrekha multi-purpose project was under construction, mass hunger strikes were organised to demand rehabilitation of the peasants of the 95 villages scheduled to be decimated by the project (see "Development *versus* People", *EPW*, May 6).

What has the democratic State done to the original inhabitants? Teak is planted and the people lose food for non-agricultural months; trade in forest products is taken over and the people find no buyer, a law that no land can be sold in Santhal Parganas is framed and the santhals go destitute in tents of thousands; big projects are undertaken and six lakh adivasis and harijans are uprooted in two decades. How can the people ever identify themselves with such a State?

In order to liquidate the movement in Jharkhand, government has pursued its well-tested, two-pronged policy of annihilation and assimilation. On one hand, it has packed Jharkhand with forces of CRPF, Bihar Military Police, Bihar Armed Police and others and has given them a free hand to "firmly deal" — to use the chief minister's phrase — with the "anti-nationals" and "anti-social elements"; on the other hand, it has set up three "autonomous development authorities" for North Chotanagpur, South Chotanagpur and Santhal Parganas, whose chairmen have all been Janata leaders who had been openly backing the separate statehood movement. Chotanagpur now has a 'mini-secretariat' at Ranchi, whereby the people of the area would be 'saved the trouble' of travelling to Patna for every application. Government has appointed as commissioner, tribal welfare commissioner and deputy commissioners those IAS officers who are 'sympathetic' to the poor. There is a spate of 'special plans', sub-plans and great plans, all oozing with sympathy for the adivasis and harijans. Journalists have been so ecstatic after a 'conducted tour' of Chotanagpur that one of them has talked of a "great economic revolution" in the region; he probably did not know that out of the Rs 75 crores allocated under the tribal sub-plan in 1978-79, only Rs 21 crores has been spent. And to know how even this sum was spent, one need not go to Chotanagpur.

It is not difficult to see what will happen to the three new autonomous development authorities. The now-dissolved Chotanagpur and Santhal Parganas Autonomous Development Authority, which was formed five years ago by the Congress government, did not help anyone except its deputy chairman Kartik Oraon, the then Congress MP. The newly created autonomous authorities are interestingly going on the same lines: over a year after their formation by state cabinet, they have not even opened their offices. As for the development of the region, the first act, for instance, of the chairman of the Santhal Parganas Autonomous Development Authority has been of building a two km-long road to link Bilari, his village, to Pathra Mod, the main avenue in Godda sub-division.

While the policy of assimilation seems to have been very successful in the case of Janata elements, it has miserably failed to appease the mass organisations and their leaders. For them, the state has let loose its armed forces. The armed forces have liberally used their weapons, attacked thirty villages when there was some trouble in one village, arrested hundreds of people even when only a few violated some section of the IPC, plundered village after village and humiliated the defenceless women. In Singhbhum, they took orders from the forest contractors and in Santhal Parganas from the moneylenders and landlords. At Goelkera in Singhbhum in November last, the police attacked and shot the people who were resisting extortions from the contractor of a local weekly hat. On March 17, a big landlord, moneylender and mukhiya of Pakaria village of Santhal Parganas called a CRPF party to shoot the supporters of an adivasi armyman, who was opposing usurpation of his 3-bigha plot allotted by the government three years ago. In the 18 months of current political and economic movements in Chota-

[illegible] the police has fired at ten places, killing an unspecified number of people. The police bloodshed and violence has scared the people of many villages away from their homes. After the March 17 firing at Pakaria, truck-loads of CRPF began raiding all the villages in the neighbourhood and picking out the adi[illegible] and literally flogging them a[illegible] destroying their meagre food stocks. The result has been that over 15,000 adivasis of 80 villages have fled their homes to take shelter at the Sundarpahadi hills, where they have been starving for weeks.

ASSAM

Explosion at Bargolia Colliery

Seema Guha

ON January 22, 1979, a major accident took place in the Bargolia coal-fields of the Upper Assam district of Dibrugarh. 12 miners died on the spot and 80 others had to be hospitalised. Among these, four more miners succumbed to their injuries bringing the death toll to 16 altogether. Most of the miners killed were young (three of them were recently married) and nearly all were the sole breadwinners of their families. A compensation of Rs 1,000 has been paid to each of the families of the deceased and the company has also promised to give employment to one member from each of the affected families. The Union Ministers for Labour and Energy, both of whom visited the site of the accident, held an inquiry as well.

According to several miners who were working inside the mine (D2, Brake O Level Main Siding, as the Company officials refer to it) around 8.30 that morning, they heard a zooming sound accompanied by a strong blast of wind. Moments later the entire mine was filled with a thick blanket of smoke making it difficult to see anything inside. A fire broke out and the haulage driver, trip driver and the tape lifter of the section of the tunnel received severe burn injuries. On seeing the smoke and the fire, and fearing being trapped in, the miners inside panicked and, instead of taking the usual route out, tried to rush through the nearest smoke-filled exit door. In the process many of the miners were injured. About 50 workers were found unconscious or semi-conscious inside the mine, probably overcome by noxious gases. The bodies of all the 12 dead men were found in D2 Brake, some of them being badly charred.

Immediately after the accident the haulage room of the South Limb mine revealed a number of burnt cables. Many of the cables were oozing out fresh bitumen. The plate of the bell transformer was discoloured probably due to the intense heat, the OCB was pushed to one side and the glasses in the ammeter and the earth leakage relay were shattered.

All these point to the fact that the accident was due to fire, caused either through a faulty wiring system or, more likely, through the ignition of methane gas inside the mine. A certain amount of methane, a highly inflammable gas, is present in all coal mines. It is essential for mine safety not to allow the percentage of methane to exceed a certain proportion. This is done by the use of exhaust fans which flush out the polluted air while fresh air is circulated inside by means of huge fans placed in strategic positions. On the day of the accident one ventilation exhaust fan inside the mine was not working properly. There was also a power failure (before the accident) twice that morning — once between 6.45 and 7.30 due to a fault in the over head line and again from 8.20 (about ten minutes before the fire broke out) to 9.40 due to a defect in the joint box of the feeder. The ventilation inside the mine was not adequate and left ample scope for a fire to occur.

Another version of the accident is that coalheads fell on an electric junction box breaking it and causing instant ignition — not an unlikely possibility in view of the large amount of methane gas present in the insufficiently ventilated mine.

The official version of the accident put forward by the Coal India officials from their regional headquarters in nearby Margherita says that "...in the second fall of the South Limb there is a splinter seam... this is probably the likely spot of the pocket of methane which was ignited. In the vicinity of the fall a cable had been damaged and revealed a puncture". Officials take pride in the fact that out of the 320 miners inside at the time of the accident, 'only' 12 were killed.

Coal in Assam was first mined by the British-owned Assam Railway and Trading Company in 1882 and was confined to five fields in the Dibrugarh area — Namdang, Bargolia, [illegible] and Jaipur. With nationalisation, [illegible] Assam collieries came under the control of Coal India. Coal miners in Assam are chiefly comprised of Nepalise, tea garden workers, labourers from Andhra Pradesh, Muslim 'Khan' who claim to have originally come from Afghanistan, and a few local people who, however, generally take jobs which do not require them to work underground. Even after nationalisation, the lot of the miners has not shown any appreciable improvement. True, the wages of the permanent workers (about 60 per cent of the total strength) has increased to around Rs 520 per month, and they are also eligible to free housing, medical facilities and education for their children. But in actual fact most miners are not provided housing for the simple reason that there are so few of them. The majority of the workers continue to live in miserable hovels. The schools meant for the miners' children are there more or less just in name. The management is unwilling to spend funds on schooling and would much rather hand over these responsibilities to the state government. According to Kul Bahadur Chetri, the Janata MLA from Margherita, when it came to arranging buses to take the children of the officers to high-priced schools and back the necessary arrangements were easily made, but when it came even to such basic things as the repair and maintenance of the workers' children's schools there was invariably a lack of funds.

But however unsatisfactory the living conditions of the permanent workers of Coal India, the lot of the miners who are employed through the contract system is much worse. Even today, nearly eight years after nationalisation, certain mines are still leased out to private contractors who operate them for the Company and who are free to directly recruit labour. Though officially these miners are supposed to receive the same wages as the regular miners, in actual practice they hardly ever do. Their wages depend on the availability of labour at the particular time and the whims of the individual contractor. Further, these workers receive no medical, housing or schooling facilities. Bonus is also naturally denied to them. As much as 40 per cent of the coal miners in Assam are such casual workers.

Though there are two trade unions in the area, one affiliated to the AITUC and the other to the INTUC, so far no one has taken up the cause of the casual workers. As the assistant Labour Commissioner in Gauhati hap-

pily asserted, labour-management relations in the mines here are 'excellent'. He pointed out that apart from two or three strikes (which were anyway part of nation-wide strikes) there had not been any instance of a strike in the Assam coalfields. As the official triumphantly said, "...the people are too simple to bother about unions".

KARNATAKA

The Dying of Kolar Gold Fields

George Mathew

BIJU PATNAIK, Union Minister for Steel and Mines, is reported to have said to labour leaders from the Bharat Gold Mines Limited (BGML) that wage earned without productive employment is a 'pension' and needs to be checked: He was referring to the wages of workers of the Kolar Gold Mines (KGF) which is today running at a loss. Indeed, BGML is said to be facing closure, and the population of KGF presents a picture of utter neglect.

Situated 100 km east of Bangalore, KGF with its rocky barren soil and hot dry climate was based on gold reefs running four to five miles north to south and dipping east to west. Primitive mining was carried on there during Tippu Sultan's time in the 18th century. Organised mining was begun about 75 years ago, by a British firm, John Taylor and Sons. In 1947, the then Mysore government took over the mines. In 1956, it became 'Kolar Gold Mining Undertaking' under the Government of India. In 1972, it was converted to 'Bharat Gold Mines Limited' (BGML).

The story of KGF — relating to the discovery, exploitation and dwindling of the yellow metal — is also reflected in the rise and fall of the mining town and its people. The one-time field of gold has today become a graveyard of obsolescence both of men and machines. People die like worms; the vast majority of workers in KGF today appear like walking corpses.

During British raj, because of the life style of the few managers, KGF was known as 'Little England'. The 'white man' had all the comforts of life and all possible recreational facilities. Now, these are enjoyed by Indian officers. But the present generation of workers — descendents of those who had converged on the gold town four decades ago, in the days of the gold rush, from Chittoor and Madanapalli in Andhra, Chingalpet and North Arcot in Tamil Nadu — are faced with declining gold yield and consequent stagnation and decay in human life. According to the 1971 census, the population of KGF is 1,18,861; but of this 42,749 were in the mining area and 76,111 in the non-mining area. Today there are 12,000 workers in the mines. In 1950, however, the mines employed 25,000 workers; by 1968 they were already only 22,791. Retrenchment is the order of the day. And life inside the mines is full of health hazards and accidents. Dusty and congested working areas make workers victims of mining diseases such as silicosis. Accidents, such as loose soil collapse and rock burst, were common and only recently have been brought under control.

The dwellings of the miners are those that John Taylor and Sons had planned 75 years ago. They are thatched hutments set up in rows of 120 units, and the area per family is limited to 12' x 10'. These single-room homes are, of course, without electricity, water, wash room, or toilet facilities. They are made of either bamboo thatti or asbestos sheets and, in some cases, even cement concrete slabs. The wind would find its way through the bamboo thattis if they were not plastered with cow-dung paste. The asbestos and cement slab huts become too cold in the winter and like a furnace in summer. Absence of latrines and drainage makes the area miserable. In the summer, the people have to trek miles for drinking water on the plateau. On an average, each row of 120 houses has one water tap. The congestion in the workers' colonies can be gauged from the fact that the average size of a family is 7.2, so that, approximately 840 people depend on one tap which runs for only a few hours.

In a sample survey of 424 families, it was found that 485 members are bread-winners and 3,100 are their dependents. Thus 6.6 persons are dependent on one earning member. There are no proper recreational facilities, no health education. Alcoholism is widespread in this sea of human misery.

When BGML had to retrench workers, a quasi-government concern was started to absorb the labour from BGML. It was to manufacture heavy vehicles — Bharat Earth Movers Limited. However, thanks to our 'market economy', this has proved to be a curse for the gold miners.

Only a very small percentage of the retrenched workers of the gold mines were absorbed in the BEML, because the latter required skilled workers. Besides, BEML offers excellent facilities to its workers, and their wages are much higher than those of BGML. A semi-skilled worker in BGML, a battery charger, said that with 22 years of service in the mines his basic salary was Rs 85 and DA Rs 160, aggregating Rs 245 per month. On the otherhand, even an unskilled worker in BEML gets in the beginning of his service Rs 400 per month.

The vast disparity in the earnings of people within the same locality or neighbourhood naturally has uneven economic implications. The high salary structure of BEML has driven the gold miners against the wall, because the workers from both BEML and BGML go to the same market. The prices of essentials have increased sharply in KGF after BEML came into existence. Consumer goods and textiles have thus become even more scarce for the miners. The prices of eatables in restaurants have increased by between 40 and 90 per cent. The mining workers are almost driven out of existence in the common markets of Robertsonpet and Andersonpet.

The deteriorating economic situation has pushed the miners more into the hands of the moneylenders. A survey has established that, while the average monthly income of the mining community remains Rs 218.86; their expenditure is Rs 321.33. Moneylending is the main business in KGF, next only to that of provision stores-keeping and cloth merchandising. At the first cross road of Robertsonpet, alone, there are 34 Marvari pawn shops, and in the neighbouring areas 50 such shops. The Marvaris in KGF control all the business, and the KGF population has no alternative market.

In KGF and in the mining areas, illicit distilleries are a household industry. The slums in the periphery of miners' settlements do a roaring business in the killer alochol. The Forum for Justice and Human Rights, an active voluntary organisation, is trying

through several dedicated social workers to bring about a reform in these areas. But since they are helpless to strike at the root cause of the evil, *viz*, material human misery and insecurity they are also unable to eradicate alcoholism.

According to the survey, the mortality rate in the last three years is high. It is revealing that most deaths are unwarranted by modern standards. The people who dig gold for the country, die for want of simple facilities of life and medicine.

The predicament of KGF is outlined by a survey report of 'Small Industries Service Institute' (1966). It says: "except for gold mines, this district (Kolkar) has a backward status in the industrial structure of Mysore state. The entrepreneurial talents are also limited due to poverty and unfavourable climatic conditions. Although some technically qualified persons do exist in the district, they have to remain unemployed" (pp 8, 18).

KGF's is a story of negligence and unimaginative running of the mine based on short-term economism. It was clear long ago that the gold deposit would decline, John Taylor and Sons had done a speedy job of carrying the gold of Kolar to England. When the Indian masters stepped into their shoes, they made little or no effort to ensure the future of the insecure settlement. Today, if the management is itself driven against the wall it is because of the *ad-hoc*ism they have pursued for several years even when it was obvious that the shafts should have to be closed in a few years.

The manifold problems and the utter degeneration of their lives forces the workers to resort to struggle and strikes Management on their part resort to anti-labour practices. For instance, the Nandidoorg mines workers went on a lightning strike on May 24 and 25, 1978, demanding at least an *ad hoc* payment from the arrears due to them. They were reportedly asked to sign on an agreement written in English without giving a translated copy and the agreement went against the workers' interests. The workers are now convinced that the management duped them by the settlement. In the absence of planning, managers of such losing concerns put down people's upsurges even more firmly in order to present an image of efficiency to their superiors in Delhi.

Several people were of the opinion that, indeed, BGML's history in the recent past has provided a convenient alibi for some to exploit the situation for their own ends. It is alleged that gold is being smuggled out of the mines, and that under cover of 'dwindling gold deposits' BGML has become a breeding ground for corruption: after all, if it can never be profitable, the extent of loss seems to be of little consequence. Workers at BGML are unhappy with their trade union leaders too. They believe that their leaders have betrayed them by underhand deals with the management. But people's struggle only intensifies when they become conscious of the exploiters and know that, in any case, they have nothing to lose.

LABOUR

Patchwork Settlement for Textile Workers

Timir Basu

THE industrywise tripartite settlement for workers in cotton textile industry arrived on March 14 is little more than a patchwork settlement, thanks to the left front government's timely intervention. The 55,000 workmen in about 36 mills encountered the same adversaries whom their counterparts in jute and engineering industries have encountered ever since the last tripartite agreement which ended on December 31, 1976. The Bengal Mill Owners' Association, the sole representative of textile interests in private sector in the state, took full advantage of Emergency to impose an enormous workload which has now been legalised through the present settlement.

As in the engineering industry, the strike in the textile industry was narrowly averted — because CITU did not want to resort to strike. Nine unions representing the workmen had served a strike notice on February 15, 1979 (to be effective from March 15) in support of their charter of demands which included among other things wage revision, wage differential, night-shift allowance, cheap canteen facilities and reduction of workload. Prior to the strike notice, a series of talks, mostly at tripartite level, over the charter of demands submitted in October-November 1977, had proved abortive. Against the backdrop of discussion held on December 13 and December 27, 1977, at the office of labour directorate, employers expressed in a letter dated January 1 addressed to the government their inability to concede any demand under the plea that the cotton textile industry was passing through a critical phase and that it could not bear any further wage increases which might render the textile industry in the state totally sick.

With a very good cotton crop and an assured market, coupled with a number of government subsidies, the cotton textiles industry has never had such a boom. The improved climate that was clearly noticeable even in early 1978 is going to be sustained for years to come. The industry was further enthused when the Janata government announced its new textile policy. The agrument that a meagre wage rise would render the mills sick makes little sense because one gathers just the opposite impression from what R N Mafatlal, Chairman, Indian Cotton Mills Federation, said at the 20th annual general meeting of the Federation held in Bombay on September 2, 1978: "I feel happy that the long awaited integrated textile policy for which my predecessors exerted untiringly has finally been announced and I foresee a bright future and sustained growth for this industry."

Coming back to the disputes which have been hanging fire for a fairly long time, fruitful discussions started at the initiative of the government only after the strike notice had been served. Meetings were held in the office of the Labour directorate on February 27, March 2, 6 and 8, 1979 and thereafter before the labour minister, government of West Bengal on March 12 and 14, with a view to arriving at a tripartite agreement patterned after the settlement in jute and engineering, to be valid for three years from the date of signing.

According to the agreement now arrived at, the basic wages of all workmen irrespective of designation — that is, whether time-rated or piece-rated — shall be increased by Rs 47.50 per month payable from March 1, 1979; this means that the long period uncovered by any settlement ever since the last tripartite agreement ceased to operate (from December 31, 1976) will be treated as holiday, as far as wages are concerned, for the employers. The monetary gains stemming from the new settlement do not compensate for the losses resulting from such delay.

The DA formula is the same as it is in jute and engineering settlement. Henceforth workers will have an increase of Rs 1.80 per month in addition to the normal DA: the enhancement is the result of the new basis of neutralisation at the rate of Rs 1.30 in place of Rs 1.15 for the rise of 12 points. 1960 will continue to be the base year, workers' repeated representations to change the same notwithstanding. The base itself is a source of substantial loss to workmen's income, let alone the manipulations in the formula. Again, as usual DA is pegged at 300 points which will be considered the floor, and for a rise or fall between 300 and 335 points, the adjustment shall continue to be at the rate of Rs 1.15 per point. But employers and government have other reasons to strictly adhere to this new formula which fails to correctly appreciate the Consumer Price Index numbers and proper neutralisation arising thereof. Actually the Bhoothalingam Panel recommendations have made their entry in DA formulation through the back door; and since the left front government and the central trade unions cannot avoid the embarrassment of being called vehicles for implementation of those black recommendations designed to curtail the existing rights of the workmen, all their earlier opposition and demagougy now sounds very funny.

The Janata government has really not abandoned its plans to implement the recommendations of the Bhoothalingam Panel Report; but in the face of stiff resistance from organised labour, it is now planning to implement the recommendations part by part, without of course uttering the name of Bhoothalingam. It has been done in the banks and in West Bengal all the recent industrywise settlements have derived from the Bhoothalingam Panel Recommendations — at least in the case of DA. The trick works; and if this tactic of piecemeal solution is not checked right at the moment it will be too late to look into the matter after three years.

The existing wage system comprises in the main a basic wage and a DA; and the basic wage is kept at such a low level that without DA employees cannot meet both ends. In fact DA is a major component of wage in almost all the organised sector industries and the cotton textile industry is no exception. Again DA is strictly regulated by the Consumer Price Index (CPI) numbers and the CPI 1960 series (on which DA is based) suffers from many defects and errors which were deliberately incorporated into it at the time of framing this series. The 1960 series is worked out on primary data collected 22 years ago and cannot reflect the present spending habit of workers. A scientific base with concrete appraisal of spending pattern and weightage diagram should be built up without further delay if the authority at all wants to render fair justice to workmen. It is strange that the unions agitate for increase in DA on every occasion without pressing the demand for introduction of a new series correctly reflecting the market.

The terms of settlement for house rent allowance are same as the terms agreed to in the settlement of the strike in jute industry. While house rent will continue to be paid as per the House Rent Allowance Act 1974, it is agreed that where quarters are at present occupied by more than one allottee, 'the existing practice' will remain in force. And what is this 'existing practice'? Four or five persons live in a room of a single allottee and *all* are subjected to rent deductions. Some collective bargaining!

But the most significant gains made by the employers have been in the fields of workload, grades and scales of pay, occupational wage differential of all categories of workmen and wage structures of workers in units mainly consuming staple fibre or multi-fibres. It is a matter of common knowledge how the managements in each industry, irrespective of the nature and hazards of work, increased the workload. In the new agreement, there is no provision to reduce the workload nor any proposal to rationalise the same; the question is to be referred to an expert committee which will be required to submit a report to the government within six months from the date of its formation, subject to final approval of the labour minister. Regarding wages, etc, another expert committee, along the same lines as the one on workload, will be constituted.

It is also possible that with the enforcement of new agreement, the existing canteen facilities will be withdrawn and managements will be free to run them on a 'no-profit-no-loss' basis. The terms of agreement on night allowance, somewhat vague, might lead to some complications. It is agreed (clause 5.8) that the labour department will intervene and exert its utmost to settle the case of night shift allowance amicably out of court. This can be no more than a pious wish. For instance, the workmen of Hada Textiles under the sway of Textile Workers' Federation had been entitled to get 10 per cent of the basic wages as night-shift allowance as per the award of the first tribunal, Government of West Bengal, made some four months ago; but the management has straightaway challenged the award in the High Court. The workmen cannot be expected to forego their rights stemming from a Tribunal award while the management is allowed to keep its options open.

On the top of it all is clause 5.11 which, more than anything else, is a pointer to how industrial relations in West Bengal will shape during the next three years — the period of settlement. Though it is the common practice to agree that the terms of a settlement can be terminated in writing by either side by serving two months' notice, the unions seldom repudiate the terms even though the employers frequently resort to flagrant violation of the same without officially announcing the termination of the agreed principles laid down in an agreement. Clause 5.11 reads: "The issues in union's charter of demands, not covered by this agreement are not pressed. Existing facilities will, however, continue." This means that while it is good-bye to longstanding demands for three years, it also means ('Existing facilities will, however, continue') that the employers will be free to enforce the present workload and other unfair labour practices. Indeed, with the withdrawal of the strike notice on March 15, 1979, the charter of demands too stands withdrawn.

The exclusion of NTC mills from the purview of the settlement is another disturbing element. Of the total Cotton textile workforce of about 55,000 in West Bengal the NTC employs about 22,000. Long before the strike notice, CITU and some persons in authority are reported to have asked the workmen of NTC mills not to join the proposed strike. The idea was that this perennially 'sick' public sector undertaking should be kept outside the ambit of any struggles for the time being. But coal is part of one of the biggest nationalised sectors and yet CITU has not been reluctant to resort to a strike in the coal industry, despite the industry's offer of Rs 70 in the form of a package deal.

That there would not be any strike in the cotton textile industry in West Bengal was clear enough even in June 1978 when the NTC unilaterally granted an *ad hoc* wage increase of Rs 30 to each worker. The Bengal Mill Owners Association, allegedly in con-

nivance with the government, was in fact buying time to settle the disputes within the framework of the same *ad hoc* increase as was done in NTC mills. The trade unions under the control of left front parties were equally eager for a settlement. During the discussions, two TU bosses who are directors of NTC reportedly said that industrywise settlement will also be binding upon the NTC mills. But it is now clear the authority has hardly any desire to honour the tripartite wage settlement for it is not the NTC but the Bengal Mill Owners Association which is a party to the said agreement. Meanwhile the NTC workmen have started agitating. The campaign was opened by AITUC-led Textile Workers' Federation with a telegram to the Union industry minister asking him to intervene. But the implementation of industrywise settlement will not be an easy matter in the NTC mills since the Union industry minister is waiting with a Bill to amend industry regulation which seeks a moratorium of 5 to 8 years on disputes in industrial units taken over or managed by the government.

IRAN

Another Showdown?

Asghar Ali Engineer

IT is unfortunate that the entire popular movement against the Shah of Iran is sometimes sought to be seen as a medieval revivalist movement led by a bigotted mullah. Some commentators even endorse the Shah's view that the 'black and red reaction' led the revolt to sabotage his programme of land reforms and modernisation.

The facts however are otherwise. A publication by the Organisation of Iranian Peoples' Fedaee Guerillas — OIPEG — ('Land Reform and Its Direct Effects in Iran') analyses the real character of these so-called land reforms. The so-called land reforms were cleverly designed to benefit only the upper classes in the rural areas and to introduce under State patronage capitalist farming on a big scale. The landless and the rural poor were left high and dry. Not only this, the measures upset the traditional rural economy and adversely affected the poor peasants. They were basically oriented to meet demands for cash crops and raw materials in the western market and brought windfall profits to the upper classes in the rural areas. The Shah's family also greatly benefited from this new orientation. No wonder the peasantry's anger was directed against the Shah precisely because of these fake land reforms, and Khomeini's call to revolt found ready response in these discontented peasants.

Many of these peasants uprooted from their land migrated to urban areas in search of jobs. But they succeeded only in swelling the ranks of unemployed. The Shah's industrialisation programme was no less hollow; it was equally elite oriented. These industries instead of catering to the needs of the common people, assembled automobiles or manufactured luxury goods required mostly by the rich classes. The oil revenues were either squandered away on ambitious programmes of armament or went into lining the pockets of the rich and the super-rich. The ostentatious living of the rich on the one hand and the increasing misery of the urban masses on the other created an explosive situation. The petty bourgeois urban classes were also economically ruined. To add fuel to the fire the Shah ruthlessly put down democratic and liberal opposition thus antagonising the intelligentsia as well.

Ayatollah Khomeini, a trenchant critic of the Shah's regime since early 1960s and exiled for his consistent anti-Shah stand, became the symbol of the revolt in Iran because he represented aspirations of the people of Iran by denouncing monarchy and also its blatant support to US imperialism. It would be wrong to maintain that the people of Iran rallied round the Ayatollah because of his advocacy of an Islamic republic. Only a small section of his conservative followers may have drawn inspiration from his Islamic principles.

It is also not true to say that the developments in Iran have been in the nature of a sudden eruption. Two guerilla organisations — *Chirika-e-Fidayeen-e-Kalq Iran* and *Mujahideen-e-Kalq Iran* — had systematically worked for years not only for armed struggle but also for spreading Marxist ideas among the workers and the intelligentsia. While the *Chirika-e-Fidayeen-e-Kalq Iran* (Organisation of Iranian People's Fedaee Guerillas, *OIPFG*) is purely Marxist in its orientation, the *Mujahideen-e-Kalq Iran* is an Islamic-Marxist organisation, though its theoreticians, while continuing to adhere to Islam, believe in its radical re-interpretation so as to ensure socio-economic justice for the toiling people. However, both the guerilla organisations have been co-operating with each other for a common goal. "The Socio-Economic Analysis of a Dependent Capitalist State" by Bizhan Jazani, a founding member of the *OIPFG*, makes a scientific analysis of the situation prevailing during the Shah's regime. According to Jazani, in the post-land reform period, feudal-bourgeois exploitation was replaced by bourgeois exploitation. "With the emergence of the bourgeoisie, the peasants had to endure exploitation by the feudalists as well as by the bourgeoisie, and indirect exploitation by imperialism. Therefore, with the dissolution of feudalism the way became open for the growth of bourgeois exploitation. Moreover, the budren of indirect foreign exploitation through the comprador bourgeoisie also fell on the peasants. This exploitation is generally effected in the two stages of production and exchange." Jazani analyses the impact of the so-called industrial revolution in Iran which led to the emergence in urban areas of a 'minority consumers society'. "Such a society consists of small and big bourgeoisie (comprador or the remnants of the national bourgeoisie) and the well-off section of the urban bourgeoisie. The proportion of this consumer society is twice the size of the previous ruling classes (the feudalists and the bourgeois) and is one-tenth of the intermediate sections (petit bourgeoisie, etc). Thus this society comprises a small minority (3 per cent) of the total population" Jazani also points out that "the proportion of consumption by this minority is far higher than that of intermediate sections and the form of consumption reflects the national progression of the system of dependent capitalism. This minority consumes 30 per cent of the total national income either directly (family income) or indirectly (i e, money spent on 'public' utilities such as tourist establishments, communication, health, education and entertainments: e g, airports, motor ways, beaches, ski resorts, hotels, casinos, de luxe hospitals, higher education and so on, that are in the main used by the consumer society)."

Jazani does not think that the prin-

cipal contradiction in Iran today is between labour and capital. According to him the Iranian capitalist system is a dependent capitalist system. "Foreign domination forms an important part of the prevailing system of exploitation in Iran, and since not all the exploiters and owners of the central capital are dependent on foreign domination, and even the interests and continuing existence of some or them, namely, the national bourgeoisie no matter how weak, is against the continuation of growth of foreign domination and comprador bourgeoisie; moreover, foreign capital, although exploiting us, cannot be regarded as part of the Iranian bourgeoisie. Consequently, it follows that the contradiction between labour and capital, with its social manifestation of the contradiction between the proletariat and the bourgeoisie, cannot be the principal contradiction of the system prevailing in Iran." According to Jazani, the situation is not ripe for socialist revolution in Iran as the national bourgeoisie has a progressive role to play *vis-a-vis* the foreign monopoly capital.

Jazani wrote all this before he was killed during the Shah's regime. Now that the Shah has been overthrown and the situation is fast changing, what are the new portents? The Marxists led by the *Fidayeen-e-Kalq* wield a great deal of influence over the workers in the oil and other industries. The workers in the oil industry did not resume full scale production despite repeated appeals by Ayatollah Khomeini after his triumphant entry into Iran. Highly politicised as they are, the oil workers demanded a ban on supply of oil to countries like Israel and South Africa. According to the latest reports the daily production of oil has been limited to 1.0 million barrels which, though more than double that of last ten weeks, is considerably less than the previous output peak of 6.5 million barrels a day before the beginning of the strikes last October.

The militancy of the oil workers is no isolated exception. A massive demonstration in Teheran by an estimated crowd of 50,000 Marxists on February 24 showed the strength of the Leftists and the support the oil workers enjoy. It was after this demonstration that the Ayatollah was greatly perturbed and got the interview which he has given to *Al-Ahram* of Egypt from Paris published in the newspapers. (Earlier this interview had been withheld from the press.) He is reported to have said in this interview that Iran will not be allowed to be "the Cuba of the Arab world". The Ayatollah called the demonstrating *Fidayeen-e-Kalq* as "anti-Islamic opportunists and enemies of the revolution".

In fact it was not the 'charisma' of the Ayatollah which brought about the end of Shah's regime. The Shah-appointed Bakhtiar government continued until the technicians from the Air Force, a large section of whom are under the influence of the Marxists, resorted to armed rebellion, only when the Bakhtiar government collapsed. Also, the large number of arms seized on this occasion have not been surrendered despite Khomeini's repeated appeals.

What about Khomeini's economic programme? Khomeini has so far failed to spell out the concrete measures for socio-economic justice in his Islamic republic. He has been talking very vaguely and his radical programme has gone no further than giving free water and electricity to the peasants.

The Marxists are demanding, among other things, total dissolution of the imperial army and its replacement by the people's army; people's courts instead of the secret Islamic tribunals to try members of the old regime; the return of all land to farmers with free rural electricity and water and interest-free loans; nationalisation of banks and foreign capital. The Marxists have also challenged Khomeini to reveal if his "Islamic revolutionary council", the supreme decision-making body of the regime, has on it any oil workers, trade union members, white-collar workers, soldiers or guerillas. The armed forces too have shown signs of dissent. Mehdi Bazargan was forced to withdraw his nominee for Air Force chief and name a new air commander.

Clearly, mere talk of an Islamic republic can no more enthuse the people of Iran. The time may not be ripe for a socialist revolution; but the *status-quoist* policies too will not be accepted by the people. The struggle against the Shah brought about a tremendous awakening which even Khomeini cannot lull back to sleep. It is quite possible that as pressures from below for radical changes grow, Khomeini might lean more and more towards the US. There is a precedent for this type of reaction in Iranian national movement, the leading Ayatollah of the Mossadeh period broke with Mossadegh and ended by backing the army of the Shah in the August 1953 coup.

Revolution in Iran

Jamil Rashid

Iran: Dictatorship and Development by Fred Halliday; Penguin Books, 1979, pp 348.

IN 1971, when the Shah celebrated 2,500 years of Iranian monarchy, some kind of a myth was sought to be created that he was the descendant of Cyrus the Great. In reality, he was the son of a junior army officer who had come to power by a military coup, and "has no more royal blood or princely heritage than King Kong".

Since the overthrow of the old kingdoms by the Arabs in 641 AD a great many things have happened in Persia (Iran). After centuries of internal rivalries among various regional overlords, the Safavids (1501-1722) established the Shi'ite religion and the power of clergy increased rapidly. The institution of Imamate and their Mujtahids founded religious schools which were of far greater significance in the socialisation process of Iranian society than their counterparts in Sunni world. This centre-piece of religious orthodoxy in which there was also a protest against the established order gave the Iranian people a different spectrum from that where religion was a part of rulers' ideology, in the neighbouring Turkish kingdoms.

For 63 years after the safavids, Nadir Shah and the Zands ruled the country. The Qajars then took over and ruled Iran between 1785 and 1906, keeping a balance between spiritual and temporal powers. Iran was in an advanced stage of feudalism, where nationalism was taking roots, when the contact with the western world was being established.

In 1890, a British businessman was granted tobacco concession, with the following rights: "All rights concerning the sale and distribution of tabacco inside Iran, and the export of all tobacco produced in Iran, were vested in the Imperial Tobacco Corporation, which in return was to pay the Iranian government £15 million a year." As a protest, merchants and ulema combined together and revolted against the arbitrary ruling of the monarch who overlooked the national interest. The concession had to be withdrawn. But in 1901, unnoticed, another foreigner was granted oil concessions, and the British government moved in, taking over all the oil interests.

Between 1906 and 1921, there was an uneasy relationship among the contesting groups: religious leaders, political groups, military officers and foreign vested interests. By 1925, Reza Khan, a junior officer, overthrew the Qajars with the help of Britain and declared himself the new Shah, with the dynastic name of Pahlvi. Shah remained in power till 1941 when he was replaced by his young and docile twenty-two-year old son. Reza Khan died in South Africa in exile, without any honours.

After the war, Iran managed to show its vitality and until 1953 some of the political institutions played their role in the spirit of the 1906 constitution. However, with the overthrow of the Mosadeq government in a CIA-directed coup in 1953 Iran became the complete monarchist state. The SAVAK (Sazmani-i-Etelaat va Amjniate-i-Keshvar or the National Information and Security Organisation) and the armed forces were organised, trained and consolidated by the US through the CIA and other similar institutions to carry out the overseas domination. For all appearances, the Shah was the strong, benevolent dictator; in essence, the imperialists retained control and the Shah's powers were mostly illusionary. The recent events have shown that the empire which the Iranian monarch hoped to build was laid on shallow foundations, and not all the might of the American empire could save the King of Kings when the rural-urban masses rose against the tyranny of the State.

In the first part of the book on the Iranian State, Fred Halliday puts forward a theoretical framework. According to him, "the most fundamental point about the Iranian State is that it is a capitalist one ..." Later, he goes on to say, "Iran is probably the only country in the world where the State has combined the vigorous promotion of capitalist development with a fully constituted monarchist regime". The monarch consolidated his position through the well trained armed forces, and the terrorising SAVAK network. Halliday constantly emphasises, "it is the Shah who controls the armed forces, symbolically and actually, and not the other way round".

From this scenario, the Shah not only appeared but also convinced his foreign masters that he was a benevolent dictator who upheld the material interests of the bourgeoisie, and intelligently used the coercive forces at his command. In fact, the monarch was blamed for going through his modernisation programme too rapidly. The so-called White Revolution put forward six points to consolidate the Shah's position with the rising middle class and aspiring bourgeoisie: land reforms, nationalisation of forest lands, sale of State-owned industrial enterprises to private enterprises, profit sharing in industry, votes for women and the establishments of an education corps to go into the villages. In spite of these rapid developments and a rise in the number of privileged groups, the Shah retained his dictatorial powers: "it is the Shah who holds full executive power in a rapidly developing capitalist State, and that he has been able to increase his strength as this development has unfolded".

According to Halliday, the Shah was able to retain his position because he was able to sell in some form the national mythology of 'great past' and stability through monarchy: "The causes of Iran's political and economic problems lie not in the psychology of its ruler so much as in the character of Iranian society. Monarchism and nationalism are carefully used to reinforce each other here, since the constant theme is that Iran is only strong when it has a strong Shah." Similarly, Halliday believes that like all monarchs, the Shah had benefited from the fact that it was more difficult to challenge a King than a civilian dictator, since the only legitimate challengers were those from within the royal family, and the Shah had no such rivals. However, what Halliday finds rather striking is that Iranian monarch was able to strengthen his position as capitalist development had continued, because normally the capitalist development would lead to the transfer of power to the rising bourgeoisie. In Russia (1917), Turkey (1923), Iraq (1958), Afganistan (1973), Ethiopia (1974), Egypt (1952) and Libya (1969), the process of capitalist development was the cause of monarchs being overthrown. Of course, he can now add

TRADE DEVELOPMENT AUTHORITY

(A Government of India Organisation)

Trade Development Authority invites applications for appointment on contract for a specified period for the following posts for INDIA TRADE CENTRE at BRUSSELS.

1. Adviser (Agricultural Products) — 1 Post; Scale of Pay: Rs. 1500-2000.

Qualifications & Experience: First Class Master's degree from a recognised University in Arts, Commerce or Science including Agriculture, 10 years' experience in a senior position in the field of international marketing/promotion of exports of agricultural products or marine products or processed foods.

2. Adviser (Leather and Leather Goods) — 1 Post; Scale of Pay: Rs. 1500-2000

Qualifications & Experience: First Class graduate degree from a recognised University in Leather Technology. 10 years experience in industry or commerce in a senior position in the international marketing/promotion of exports of leather products and sports goods.

3. Adviser (Engineering Products) — 1 Post; Scale of Pay: Rs. 1500-2000

Qualifications & Experience: First Class graduate degree in Engineering from a recognised University. 10 years experience in a senior position in international marketing/promotion of exports of engineering products and/or project construction and technical consultancy services.

4. Adviser (Jute & Coir) — 1 Post; Scale of Pay: Rs. 1500-2000

Qualifications & Experience: First Class Bachelor's Degree from Institute of Jute Technology, Calcutta. 10 years experience in a senior position in the field of international marketing/ promotion of exports of jute and/or coir goods.

5. Adviser (Electronics) — 1 Post; Scale of Pay: Rs. 1500-2000

Qualifications & Experience: First Class Bachelor's Degree from a recognised University in electronics or *Telecom Engineering. 10 years experience in senior position in international marketing/promotion of* exports of telecom and/or electronic products.

6. Adviser (Handicrafts with special emphasis on carpets, Jewellery & Furniture) — 1 Post; Scale of Pay: Rs. 1500-2000

Qualifications & Experience: First Class Master's degree from a recognised University in Arts/ Science/Commerce. 10 years experience in international marketing/promotion of exports of gems and jewellery and handicrafts or carpets or furniture.

7. Adviser (Textiles & Garments) — 1 Post; Scale of Pay: Rs. 1500-2000

Qualifications & Experience: First Class graduate or degree from a recognised University in Textile Technology. 10 years experience in international marketing/promotion of exports of textile made-ups and garments.

NOTE: In above cases where minimum qualification is a graduate degree, for those having a Master's degree, required experience will be eight years. Knowledge of West European markets desirable in all cases.

8. Senior Researcher: 4 Posts; Scale of Pay: Rs. 1100-1600

Qualifications & Experience: High Second Class Master's degree from a recognised University in Economics/Commerce/Statistics/Mathematics with Statistics/Operational Research/Business Administration *OR* First Class Graduate degree in Engineering (mechanical/electrical/electronics), *OR* First Class Graduate degree/diploma in leather/textile technology. 5 years experience of export market survey and research including documentation, procedures, testing and certification requirements and other non-tariff barriers.

9. Senior Researcher (Trade Information & Statistics)— 1 Post; Scale of Pay: Rs. 1100-1600

Qualifications & Experience: High Second Class Master's degree from a recognised University in Economics/Commerce/Statistics/Mathematics with Statistics/Operational Research/Business Administration. 5 years experience in collection, compilation, economic/statistical analysis of foreign trade statistics & trade information and preparation of market information for guidance of exporters.

Relaxation of educational qualifications may be considered in the case of more experienced applicants.

10. Administrative & Accounts Officer — 1 Post; Scale of Pay: Rs. 1200-1600

Qualifications & Experience: High Second Class degree in Arts/Science/Commerce or Law from a recognised University. 5 years experience in a supervisory capacity in Administration, Personnel Management, Finance, and Accounts in a Central/State Govt. Departments/ Public Sector Undertakings or Private organisations of repute.

11. Personal Assistant (India-based) — 3 Posts; Scale of Pay: Rs. 650-1040

Qualifications & Experience: Graduate with a minimum of 5 years experience as Stenographer in Central/State Govt./Public Sector Undertakings or Private firms of repute, and possessing a speed of 120 w.p.m. in Shorthand and 50 w.p.m. in typing.

Allowances: Allowances as admissible to officers of equivalent status in Indian missions abroad.

Headquarters: Brussels with liability for tour in the countries EEC on duty governed by the travel rules as applicable to officers of equivalent status in Indian missions abroad.

Other Facilities: Free furnished residential accommodation, suitable for officers of equivalent status in Indian missions abroad.

Medical facilities as available to officers of equivalent status in Indian missions abroad.

Age: 35 years for Serial No. 8 & 9, 45 years for Serial No. 11 and 40 years for all other posts.

Age limit is relaxable upto 5 years in case of Scheduled Castes and Scheduled Tribe candidates and in case of others depending upon length of experience.

Period of Probation: 1 Year.

Higher Emoluments: Higher emoluments could be considered in case of exceptionally qualified and experienced candidates for the post of Advisers only.

Application from Indian citizens on plain paper, giving complete details of age, qualifications, experience, the post currently held and present emoluments should reach: The Secretary, Trade Development Authority, Bank of Baroda Building, 16, Parliament Street, New Delhi 110001, by Monday, the 30th April, 1979, at the latest.

Separate applications are required for each post. Attested copies of certificates/testimonials to be enclosed. Latest passport size photograph and crossed postal order for Rs. 50/- (Rs. 25 in the case of SC/ST candidates) drawn in favour of Secretary, Trade Development Authority, as application fee, are required. Fee will not be refunded. Those serving under Government/Public Sector Undertaking must apply through proper channel.

Applications not complete in all respects will be rejected summarily without assigning any reason.

DAVP 1010 (1)/79 — SECRETARY

Iran too to the list, but would he still equate developments in Iran with the developments in these other countries?

Halliday finds Pahlvi monarchs to be somewhat different from the classical dictators of our times: "The ideological mythology which the Iranian regime has fostered may well be artificial, but there is no doubt that the Pahlvi monarchs have been able to establish a much more stable imperial system than one which an individual dictator could have done. This is because they have been accepted as their representatives by the dominant classes and because of their use of the monarchical tradition in Iran for quite novel purposes." In the same vein, the author goes on to say that from 1960 onward the Shah completely dominated all the groups in Iran: the civilian politicians, the army, the Majlis members, the Press, and the intelligentsia. This was possible because the Shah had kept them dependent on his personal favours, slaves to the system which he had created from oil revenues. "Beset by personal insecurities, mistrustful of themselves and their fellows, and cynical about the motives of all persons and the outcome of all programmes, the elite respond by coping with the system, not by attempting to alter it in fundamental ways. And the process of coping consists, basically of learning to operate within its norms while maximising the benefits that can be derived from it" (p 57).

Thus, Fred Halliday comes to the conclusion that Iran was ruled by a monarchist dictator who managed to make the aspiring socio-economic-political groups subservient to his system. Although the US role was important in training his armed forces or in advising SAVAK, the Shah was independent enough to control internal and external events "because of the Shah's position as an effective monarch it is not a military dictatorship of the Greek, Chilean, Brazilian or Indonesian kind... In historical terms the army was dominant before the US intervened..." (P 101).

Does such an analysis adequately explain what actually happened in Iran? Halliday puts forward five crises, between 1905 and 1963, which gave rise to his type of monarchist dictatorship: constitutional crisis (1905-11), rise of military power (1919-25), fall of Reza Khan (1941), nationalisation of oil and Mossadeq period (1951-53), and land reform crisis (1960-63). Although he mentions the international aspect of the Shah's regime, most of the time he underplays it. A deeper analysis will show that in each of these crises, the 'foreign-power' was the common factor, and internal crisis was the off-shoot of that. Halliday however is ambiguous and explains very little when he says: "the question of the role of foreign influences in Iran is one that has traditionally lent itself to imprecision — to both exaggeration and under minimisation. In fact, the Shah has been neither as independent as he himself claims nor as reliant on foreign assistance as most of his enemies allege".

This constant emphasis on the 'uniqueness' of Iran and the monarchist dictatorship crumbles when tested against the overwhelming presence of the US till the last days of the Shah, when he was advised to take a long vacation. It is important to see the contradictions which emerge from such a dominating imperialist role in a third world country, as a whole. Even Fred Halliday agrees: "There is no such thing as a specifically "Asian" political system, nor is it of any value to invoke concept of 'Asiatic despotism' to illumine Iranian history. The whole model of a specifically Asiatic economic, social or political system is unfounded, and has done more to obscure than to clarify the study of social formations in the third world."

So revoluation in Iran was inevitable, in the same way as the French Revolution was in the making from the later days of Louis XIV, reaching its destiny in 1789 in the time of Louis XVI. The circumstances in this century are different, but the trends have similar bearings in the conditions of pre-capitalist State formation when the middle class, particularly professionals, becomes disenchanted, and the rising bread prices give rise to mass rebellion.

The real problem is, to find out how the imperialist domination of a rapidly developing third world country created antagonistic relationship between the masses and the imperialist agent who posed to be a strong ruler. Our starting point is 1953 when the United States directly took over the responsibility of imperialist interest in Asia from the diminished British power even as within Iran itself there had developed a conscious middle class aware of national interest. Now it is well known that the CIA engineered the coup of 1953, and brought back the Shah from his 'vacation' in Europe. It has also come to light that the CIA connection of Irani generals used SUMKA (Nazi Party of Iran) to create confusion on the streets. According to a recent publication, "Aside from the Party's (SUMKA) connections with the court, there is strong evidence that the SUMKA co-operated with the retired army officers' group, especially Generals Muzayani and Zahedi, and with Shams Qantabadi, then the leader of the Mujahidin-i-Islam, and anti-Mosadeq, member of the Majlis... The party fought the Tudeh in the streets, criticised Mosadeq, and defied the police..." In any case, Halliday himself has recorded (pp 64-102) eloquently how the Armed Forces and SAVAK, with US help, established a new structure in Iran:

> Following the coup, the main instrument of repression was the Military Governate of Teheran, headed by General Teimour Bakhtiar, and under Bakhtiar were two specialised intelligence units: one, the Military Intelligence, had as its main responsibility the removal of opponents from within the armed forces, the other, Police Intelligence (Aghai Kar) was used for dealing with opposition parties, trade unions, and publications. At this time Bakhtiar was helped by US advisers, and when in 1957 a new intelligence unit was set up, these became a permanent secret US mission attached to it...

At the same time, the Arab nationalism under Nasser also threatned the US interest, west of Iran. Israel, a faithful ally of the US, was at hand to supplement the Iranian power. According to Halliday, "the two foreign agencies with which SAVAK has co-operated the longest have been those of the US and Israel".

Once the US position was secured in Iran, interest shifted to the surrounding areas. Iran was self-sufficient through its oil revenue, and the US did not have to spend any funds by way of aid. Halliday notes the two new developments between 1964 and 1972. Iran began to develop a regional foreign policy, and US arms policy shifted away from the direct aid to sale of arms on credit. This was also the period of the so-called Nixon-doctrine, according to which client states like Iran were to pay for safeguarding the imperialist interest.

In 1973, US policy underwent another change. The headquarters of the CIA operation in west Asia was, moved from Nicosia to Teheran. Richard Helms, the former head of the CIA and a schoolmate of the Shah in Switzerland, was sent to Iran as ambassador. SAVAK developed closer co-operation with Israel's intelligence service MOSSAD, and increasing number of Army officers were trained in Israel. The close co-operation with Israel can also be seen from what Halliday records: "Though both states are supplied mainly by the US, Israel

has provided Iran with Soviet equipment it captured in 1967, whilst Iran has acquired arms for Israel that the latter has not been able to get for itself because of embargoes from France etc...." It is also not without significance that in the past few years, SAVAK developed ties with other intelligence services in Pakistan, Jordan, Egypt and until the April 1978 revolution, in Afganistan. Information was exchanged and common enemies were kept under observation. "In 1973, when guerillas in Pakistan province of Baluchistan, which borders Iran, started operating on a considerable scale against the Pakistan army, Iran sent around thirty Chinook helicopter-gunships to assist the Pakistan armed forces... Iran has also provided economic aid in support of the Pakistan's army's military campaign and civil action programme in the province ... ."

After retiring as Director of SAVAK in 1978, General Nassiri was sent to Pakistan as ambassador, where the regime accepted him with open arms. As Halliday writes "General Nassiri's new position was an extremely important one, given joint Pakistan-Iranian concern about the new revolutionary government in Afghanistan and the danger this posed to the military regime in Pakistan". The Shah was able to discharge his duties, directed by the imperialist masters, by engaging in counter insurgency operations in the third world countries. As Halliday notes: "No third world state has a record of intervention outside its frontiers comparable with Iran's in the period since the mid 1960s. South Korea, Indonesia, Zaire, Israel, Brazil and Saudi Arabia have all intervened, directly or indirectly, in support of counter revolutionary forces beyond their frontiers, but none have done so on the scale of Iran ...".

With all this evidence and analysis provided by Fred Halliday himself, how can he still insist that "the Shah is not an 'agent' because he has challenged the US and because many of his actions applicable in terms of the interests of the Iranian State, as much as in the interests of the US"? The interest of the rulers in a bourgeois set-up is not the same as the interest of the people; it was basically the interest of the Shah and his family which he posed as the interest of the Iranian people. *The Shah was the State.*

Halliday accurately observes that the Sixth crisis (1978/79) (that is, the current crisis) is more deeply rooted in Iran's socio-economic structure than any previous ones. This structure emerged from the foreign domination from 1905 onwards, culminating in the complete repression of 1953-78 and the final collapse of February 1979. Even the President of the United States has been baffled and has criticised the CIA for failing to foresee the revolt of the Iranian masses. Fred Halliday completed his book before the February events, and so has only a general comment in passing over the more recent developments; "The events of 1978 showed that there is the basis in Iran for a new popular movement evoking Islamic ideology to emerge, as it has done in Turkey, Pakistan and some of the Arab countries." But it should be pointed out that a comparison between Pakistan, a neo-feudalistic society, and Iran cannot be easily sustained. On the surface, it would appear that Islamic leaders have been the main force behind the Iranian revolution. However, deeper analysis would show that the seeds of revolution were sown the day imperialists imposed a dictatorial structure in Iran; the religious forces have worked as a catalyst, while the mass base of Iranian *revolution has been broadly secular.*

It is necessary to look a little more closely at how the internal dynamics of this revolution worked. Oil revenues accounted for 38 per cent of the GNP in 1977-78 compared to only 17 per cent in 1967-68; in 1977 it accounted for 77 per cent of government revenue and 87 per cent of foreign exchange earnings. At the same time, as Halliday points out, "on its own oil has no development effects, i e, it establishes no significant linkages with the rest of the economy. It has no 'backward linkages' in that it employs a tiny labour force, and acquires its capital and technology from abroad; nor does it establish 'forward linkages' in that most of its product is exported." In 1977, there were only 55,000 oil workers out of a total employment force of 10.25 million. The key positions in oil production were held by foreign professionals, in spite of a locally available highly educated labour force. As Halliday points out, a rent-based economy encourages the service sector at the expense of the production sector. This was evident in Iran, where dramatic changes took place between 1959 and 1976: the share of agriculture in GNP (excluding Oil) dropped from 36 per cent to 15 per cent and that of services increased from 45 per cent to 55 per cent. The gulf between rural and urban income also widened. In 1976, output per capita in rural Iran was $251.4 while for urban population it was $3,079. With the spread of capitalism in agriculture from 1960 onward, unemployment in agriculture further increased and migration of rural workers to the urban areas also increased rapidly. (See, M A Katouzian, 'OIL versus Agriculture, A Case of Dual Resource Depletion in Iran', *The Journal of Peasant Studies*, April 1978.)

Under such a situation, three factors emerged: increased unemployment in rural-urban workers; increased number of students, professors, petty bourgeoisie and other professionals, and, finally, rising prices affecting all classes *except the foreign workers and the* Shah's associates in important positions. The clergy in Shi'ite Islam has closer links with the rural workers, and student population of the old established institutions like the one in Qom and other religious centres. Over the past few years, the Shah was spending much of the oil revenue on non-productive goods, mainly buying expensive military hardware from the West. The result was inflation and a sharp decrease in the real income of the middle classes. At the same time bread prices increased rapidly. Traditionally, and more so recently, the religious leaders had links with the Bazaar people; and it was these people in the Bazars who mobilised the masses and financially helped the movement; the suppressed intellectuals and students in Teheran University and the exiled Iranians gave the movement its theory.

Backward Class Benefits and Social Class in India, 1920-1970

Lelah Dushkin

India has had more experience than any other country with systems of preferential treatment for ascriptively defined groups. Beginning with the British and some princes long before Independence and continuing to the present day, such treatment has been the principal means of addressing the problems of the lowest ranking castes and the tribal populations.

Today its suitability and effectiveness in addressing these last problems are the subject of both street violence and constitutional debate. "Who really benefits?" it is asked. "What price is paid, and who pays it?" "Is there any better way of addressing the problems?" These are only some of the questions being argued and to which I would like to contribute some observations in this paper.

In making my observations, I will be drawing on two bodies of material: the history of the Non-Brahmin movement and Backward Class provisions in the former Princely State of Mysore during the three decades before Independence, and the present-day provisions for the Scheduled Castes in India as a whole.

INDIA has had more experience than any other country with systems of preferential treatment for ascriptively defined groups. Governments have coped with grievances and resolved problems of their own many times in this manner. For example, the British used this mode, not only to meet Muslim fears of Hindu domination but in a classic application of Divide and Rule, when they granted separate electorates in 1906. Some Princely States in the South used it, when they found their administrations overwhelmingly staffed by Brahmins, to get more appointments for Non-Brahmins and thereby to strengthen support for themselves among the great majority of their subjects. Beginning with the British and some princes long before Independence and continuing to the present day, it has also been the principal means of addressing the problems of the lowest ranking castes and the tribal populations.

Today its suitability and effectiveness in addressing these last problems are the subject of both street violence and constitutional debate. "Who really benefits?" it is asked. "What price is paid, and who pays it?" "Is there any better way of addressing the problems?" These are only some of the questions being argued and to which I would like to contribute some observations in this paper.

It should be noted at the outset that in the type of arrangements we are discussing there are typically three political actors: a category of actual or potential beneficiaries, a category which feels threatened by or otherwise opposed to the system, and those in power who grant the benefits for their own reasons and have their own priorities for distributing them. In addressing the question, "Who benefits?", we can assume that those in power see some political advantage to the system or they would not have adopted it. Thus we will discuss the issue with respect to the category of beneficiaries, but will return to this point at the end.

In making my observations, I will be drawing on two bodies of material: the history of the Non-Brahmin movement and Backward Class provisions in the former Princely State of Mysore during the three decades before Independence, and the present-day provisions for the Scheduled Castes in India as a whole For those unfamiliar with these terms, let me sort them out. "Backward Classes" are ascriptive groups (castes, tribes, religious groups) officially recognised as eligible for certain benefits on ground of their relative disadvantage. In Mysore, from 1921 until well after Independence, the BC included everybody except the Brahmins and those whose mother tongue was English: some 96 per cent of the population. Thus the term is synonymous with "Non-Brahmin" in its broadest sense. In modern India the Backward Class category has three main components: the Scheduled Castes (called Untouchables, ex-Untouchables, or Harijans) who comprise over 90 million people or one seventh of the Indian total; the Scheduled Tribes (called Aboriginals, Adivasis or Girijans), about 43 million; and the Other Backward Classes, a catch-all category whose size is probably about the same as that of the Scheduled Tribes.[1] They are eligible only for educational benefits and, in a few cases, economic ones.

After doing a good deal of work on the Scheduled Castes some years ago,[2] I turned to the Non-Brahmins in Mysore.[3] In the course of studying the Backward Class provisions there I developed some notions which I would like to apply to the present day Scheduled Caste provisions. The essential idea is that if we are to answer the question, "Who benefits from a system like this?" we have to ask, first, "from what kind of provisions?" There is a dimension of social class within the ascriptive category of beneficiaries that has to be taken into account. Sometimes this is completely ignored and the Scheduled Castes or the Non-Brahmins are spoken of as if they were homogeneous. Often the class dimension is alluded to, but mainly in order to criticise the system by claiming that a small middle class or elite group within the category is monopolising all the benefits. I submit that this, too, is a distortion

Indeed, to oversimplify for a moment, both in the US and in India the confusion between the inherited-group nature of some problems and the socio-economic classes of the individual beneficiaries of efforts to solve those problems has produced intense controversy, but in opposite direction over time. The US, which

TABLE 1: GAZETTED AND NON-GAZETTED APPOINTMENTS IN MYSORE STATE SERVICES: PER CENT BRAHMIN IN SELECTED YEARS, 1918-1957

Year	Gazetted Posts	Non-Gazetted Posts
1918	64.86	69.64
1930	69.67	54.13
1936	61.32	49.65
1947	46.89	37.50
1957	35.72	27.65

Note: Gazetted posts comprise the top 2 to 3 per cent of posts in the years covered.

assumed that the unit in the system is the individual, 'discovered' in the 1960s that some problems associated with inherited group identities are so intractable that various preferences were adopted for racial/ethnic minorities and women. Now these "affirmative action" provisions are under increasing litigation. In India, by contrast, the assumption has been that the unit in the system is the group and the 'discovery' has been that the beneficiaries are, of course, not groups but individuals. Individuals act, at least partly, in their own self-interest and this together with their diversity by class has led to an increasing rhetoric of outrage at the system even by those initially favourable to it.[4] Since it has always had its enemies and is today subject to increased public attention, this seems an appropriate time to try to sort out the factors of class and caste.

LEVELS OF BENEFITS

We begin with the simple point that different kinds of provisions appeal to different kind of people. Moreover in a situation of scarcity they also threaten different kinds of people. If we are to evaluate the suitability and effectiveness of the provisions in meeting the needs of different classes of beneficiaries, we have to sort out the benefits by social class. I have, accordingly, found it helpful to divide the Backward Class provisions into three kinds. I will first describe and evaluate them with references to Princely Mysore and will then turn to the Scheduled Caste data at the national level.

Elite Benefits

The first kind I call "elite benefits" in the sense that they are of concern only to a small elite within the category, and also in the sense that they involve things that the elites in the society at large want for themselves and their own offspring. These are: Class I and II administrative government posts, admission to the universities and, especially, the medical and engineering colleges, seats in Parliament and the state legislatures, and nominations to high office. For the Scheduled Castes (SC) the first three are provided by reserving percentages for them, usually in proportion to population, but for the first two, if there is no "qualified candidate" available the seat or the job goes to someone else. This happens frequently.

In Mysore reservations were adopted for the first two — government jobs and university education — but not in proportion to population. No reservation was adopted in politics, but spokesmen of minority Non-Brahmin communities were nominated to the Representative Assembly if nobody from the community could get elected. What the elite from within the Non-Brahmin community wanted was power. Not jobs, power, and for a few years they sought it through appointments to decision-making civil service posts, as one of them candidly stated in a 1921 debate:[5]

> Our parents saw how Brahmin literates were getting on in life and therefore thought that if we were educated we too could get on well. Some of us were educated accordingly. But what was the result? We were about 7 or 8 graduates and when we went to the authorities and asked for appointments, they offered us Rs 20 and so on. Twenty rupees we could earn by having a cow. If we passed high exams it was because we hoped for high appointments...

It was only for about a decade that persons like this relied primarily on BC benefits to get what they wanted for themselves and their own offspring. By the late 1920s their close relationship with the Durbar was eroding as they put more and more emphasis on the electoral route to power, on constitutional changes, and on agitations to mobilise supporters. At the end of 1937 they made common cause with their former foes, the Brahmin nationalists, by forming the Mysore Congress against the Durbar and its British backers. And they took power at Independence.

Middle Class Benefits

The second kind of benefits I call "Middle Class Benefits". These consist of appointments to Class III (clerical) posts and a variety of scholarship schemes to assist high school and college students. The above gentleman spurned this kind of clerkly job and never needed the Rs 3, 4, or 5 per month that was paid out as a Backward Class scholarship. But like all politicians, he was profoundly concerned with how such benefits were distributed, and sought to obtain them for his own supporters. Since these benefits are numerous but those who meet the modest qualifications for them even more numerous, they lend themselves to the political pressures for "distributive justice"[6] or, in the words of the Durbar, "adequate representation". Politicians served on the Central Recruitment Board, an advisory body, and on the District Backward Classes Scholarship Committees. The pressures in this situation were to cut more and more component groups in on the deal and to disperse the benefits as widely as possible within the category for maximum political support. Particularly with the BC Scholarships, which were almost infinitely divisible, Mysore developed the most intricate system I know of for the fine-slicing of a modest financial "pie".

Lower Class Benefits

The third kind of benefits are "Lower Class Benefits" for the poor. These include Class IV posts as labourers and office peons,[7] primary and middle school fee remissions, books, slates, and midday meals, and a wide variety of economic programmes of which loans and grants for housing and house sites are the most important. Except for the Class IV jobs and some school assistance in the towns, these schemes developed after Independence and are not to be found in Princely Mysore's Backward Class system. Those who were, in fact, concerned about poverty and rural problems did not think of solving them with Backward Class benefits. Instead, they called for drastic overall changes in economic policy,[8] which they believed would come with Independence and a Congress government.

EFFECTIVENESS IN MYSORE/KARNATAKA

Well, how do these three types of provisions work to benefit the different

classes of potential recipients according to the experience of Princely Mysore and modern Karnataka, its successor state since the late 1950s?

Elite Benefits

For elite benefits the record is uneven and the difficulties of implementation are formidable because of the many forms of resistance to them within and without the government. In politics, as already noted, the Mysore experience suggests that the best way to build up power is through electoral support, if you belong to a "dominant caste". If not, it is difficult. The small communities that used to be represented by nomination lost this privilege in the early 1940s, and their non-representation in politics has been a grievance of theirs ever since.

In government jobs, the contrast between the elite "gazetted" posts and the middle-ranking non-gazetted posts as regards their responsiveness to reservations is apparent from Table 1. In the first 18 years, the proportion of Brahmins at non-gazetted levels was significantly reduced, while that at gazetted levels was hardly affected. This was for two reasons: those already entrenched in the administration had many ways to resist recruitment of Non-Brahmins to these posts, and many of the posts were filled by promotion, which takes several years. By 1947 the position had begun to change, and by 1957 the Brahmin percentage had fallen to 36 per cent, a reversal of its 65 per cent in 1918.

The most conspicuous case of the ineffectiveness of reservations concerned admissions to medical and engineering colleges, the most politically sensitive area of all. There were not many such seats and they were extremely valuable to elites in the society at large. The growth of private medical colleges, financed by the "capitation fee" system, did not ease the situation but put even more premium on money power. When, in 1974, a friend told me with delight that she had paid a capitation fee of "only" Rs 40,000 for her neice, and the college had been kind enough to give her a receipt for it, it occurred to me that any effort to counteract the power of money and class advantage by adopting reservations was doomed to be subverted. Stories of payments to upcountry authorities for caste certificates suggest amounts considerably less than Rs 40,000.

Middle Class Benefits

If any type of provisions is going to work to promote the social mobility of those eligible and interested in them, it would appear to be the middle class type. Of course, these provisions also work to the political benefit of those in power who influence or control the distributions. The Mysore experience bears out both of these statements. Mysore collected extraordinarily detailed caste data on the distribution of educational enrolments and appointments to services. Over the years they show not only that the proportion of Non-Brahmins went up markedly, but that posts were rather widely distributed among the different castes.

Over time, however, particularly after Independence, the lion's share of the posts and educational assistance tended to go either to the largest communities or to those who were well situated to take advantage of them. Gradually in the 1950s and 1960s spokesmen of some groups came to feel aggrieved that, for one reason or another, they had been left out of this distribution system, yet financially and educationally they were quite badly off.[9]

Thus in 1972, when Devaraj Urs challenged the Organisation Congress, in which the two dominant castes were very prominent, he did so in part by building support among these "Other Backward Classes" and the Scheduled Castes. He did this by practising what he called "distributive justice":[10] distributing the Indira Congress ticket among more communities and, as soon as he won the election, appointing a new Backward Classes Commission to revise the lists and recommend a new system of Backward Class benefits.[11]

Lower Class Benefits

As noted already, pre-Independence Mysore made little use of Backward

Class preferences to cope with poverty, whether urban or rural. Thus I will save my remarks on this level until the next section.

EFFECTIVENESS FOR SCHEDULED CASTES IN INDIA

Elite Benefits

Turning now to the Scheduled Castes in India as a whole, we begin, again, with the elite level of benefits. The all-India statistics, which are published annually in voluminous detail by the Commissioner for Scheduled Castes and Tribes, indicate that reservations and related concessions have begun to work more effectively than they used to at this level. But not much more: there is still much resistance in the system here, and implementation takes continual political pressure. After nearly three decades the percentage of upper level job-holders has slowly increased (Table 2). Starting in the late 1960s, pressures were brought to bear on the medical colleges in the states and the national Institutes of Technology to admit more Scheduled Caste students. Figures for 1973, for 67 of the 97 medical colleges in the country, show that these efforts have been successful in several states, and that my experience in Karnataka may be atypical (Table 3). There is, however, no information on what happens to the students after they are admitted and whether they actually graduate.

The reasons for the pressures to implement benefits were brought to bear in the late 1960s are suggestive of a point about the effectiveness of reserved seats. The mere existence of a bloc of reserved-seat holders in Parliament may not itself confer power. Only during one period did it do so. This was during 1967-71, when Indira Gandhi's majority depended on them and they were led by an experienced politician who demonstrated in August 1967 that he could and would defeat the government if sufficiently provoked.[12] During this period many new provisions were adopted as well as stronger efforts to implement those already on the books. Following Indira Gandhi's electoral victory in 1971, those in power in the Centre and the states sometimes decided that delivering the goods to SC voters was in their self-interest and sometimes did not. Whether they did or not does not seem to be directly correlated with the number of SC reserved-seat-holders in their legislatures.

Middle Class Benefits

The middle level benefits do "work", at least to get jobs and scholarships for people who would not otherwise get them. Here there is a contrast with the Mysore situation in one respect: the main reason the Non-Brahmin proportion in the non-gazetted posts changed in Mysore was that large numbers of people of various castes got the education necessary to apply for them. The change would have occurred anyway at this level, even without reservations, though not quite as rapidly.[13]

For the Scheduled Castes, however, a mere increase in the number of persons with the necessary educational qualifications is not enough. The best example of this is the contrast between the Central government services and the nationalised industries in the mid-1960s (Table 4). The industries had the same number of employees but did not reserve any jobs for the SC. The disparity is most marked at the Class III level, where the SC percentage in the services was almost ten times that in the industries. When these figures were made public, under the political conditions described above, considerable pressure was put on the industries to adopt the same provisions as the services. In only a few years, these bore fruit, as Table 4 shows.

Education is the main item of expenditure on the Scheduled Castes, accounting for over three fifths of the total. States pay for various schemes assisting pupils up to matriculation from high school, and the Centre provides post-matric assistance. Both of these have had their administrative problems, but by comparison with other expenditures on Scheduled Castes, they constitute a success story. The post-matric scholarships scheme, which I would put in the "middle class benefits" category, has been in operation since 1944 and now assists roughly 350,000 students It pays only a portion of their costs, but the policy is that all who are eligible and apply will get help irrespective of budget limitations.[14]

Lower Class Benefits

If there is any Scheduled Caste welfare programme that reaches sizeable numbers of the rural poor, it is pre matric education. In recent years, the Education Ministry has begun compiling figures of enrolments at different levels in comparison with the estimated populations of the respective age groups (Table 5). In 1973/4 nearly 7 million SC pupils were enroled in primary school, roughly two-thirds of the SC children in that age group What proportion of these were assisted by their state governments I do not know; presumably it was a good share of the total. The numbers and proportions drop off at middle and high school levels, but are still significant.

Of appointments to Class IV jobs as peons and attendants, there is little to say except that the Scheduled Caste

percentage in the Central Services reached the 17-18 per cent range twenty years ago and has remained relatively stable (Table 2). It has increased steadily in the nationalised industries to more than a quarter of the total (Table 4). These figures omit the sweepers and scavengers, who are virtually all Scheduled Caste. Whether this picture represents genuine mobility is questionable. If one is impoverished and unemployed, a steady job as a government peon looks very good. So good, in fact, that what seems to be developing as a result of the magnitude of the Class IV category and the relative success of the reservations for jobs as clerks and schoolteachers at the Class III level, is a pattern of government clientage. Studies available to me[16] suggest that approximately one-eighth of all SC households have a member working for government at some level or another (state and local as well as national). If this holds true throughout the country, it is a major feature of the condition of the Scheduled Castes today, and its implications should receive careful study and attention.

Other lower class benefits, besides those in education and lower-level government employment, do not seem to have any discernible impact on the conditions of the Scheduled Castes, and it should not be forgotten that the overwhelming majority of the SC population is in this lowest stratum. The main reason, it seems to me, is that the major problems faced by the poor are structural. Governments are unwilling to take steps to re-structure relationships, and where they try to do so, these are instantly and strongly resisted by those in the dominant positions. In this situation, doling out a few economic benefits may help this or that individual but does not cope with the problem. Although there are a large number and variety of schemes administered by the various state governments, they are almost all small and scattered, and rarely do they reach more than a relatively few people.

There are some exceptions to this last point, but they are temporary. When those in power really want the electoral support of the poor, the BC set-up provides a very convenient mechanism for delivering the goods quickly with a minimum of legal complications. With the pipeline already in place, a great deal can go into it in a hurry if there is the political will to do so, as the recent histroy of both Andhra Pradesh and Karnataka illustrate.[16]

But in most of the states most of the time the pattern is very different and raises the question of whether we are, in fact, dealing with a case of "preferential treatment" for backward classes at all. The Scheduled Caste welfare schemes are supposed to supplement the economic programmes for the general population, which are intended to benefit the SC along with others. But often they tend to replace those programmes, and when this happens the claim that assistance is being given is fraudulent. The Scheduled Castes are not benefitting from preferences but being deprived of what is rightfully theirs.

For example, in Haryana, Scheduled Caste persons applying for loans from the general departments are taunted as "sons-in-law of government" and told to go to the "Harijan Department" where, in fact, little is available. Scheduled Caste politicians, lacking the power to determine how much goes into the pipeline, are nevertheless positioned (on the key District committees) to determine how the pipeline is distributed, a process which tends to be highly politicised. In this situation, the so-called beneficiaries have to have a great deal of stamina and political expertise.[17] Haryana may be an extreme case, but the pattern, in one form or another, is not at all unusual.

Conclusions

Yet it is widely believed, everywhere, that the "Harijans" are being well taken care of by government today. We have seen that in fact the record is very uneven, not only by state and time period but by the type and level of provisions. The middle class benefits are much more successful than either of the other two types at assisting the relevant class of Scheduled Castes and at winning their political support. But the belief persists, and this gap between reality and public perception suggests some final considerations: namely, what, in fact, is the price being paid for this system, and who pays it?

Who Pays?

It is generally assumed, whenever a system of "preferences" exists for members of an ascriptive category, that the price for it is paid by everyone else: by persons who do not belong to that category but who must pay the taxes or forego the jobs or scholarships that now are given to the category in order to right historic wrongs against them. This assumption is universally made in India, yet, as we have seen, there are grounds for examining closely to what extent it is true.

Taking the lower stratum of provisions first, it is only in connection with Class IV appointments that the assumption may have some truth to it, and this is slight enough. In the Central services, the Scheduled Castes' share of appointments has stabilised at a figure (17-18 per cent) not very different from their proportion of population (14 per cent). Not very different, in other words, from what they would be getting if there were neither preferences for nor prejudices against them. In education what the Scheduled Castes get is not very different from what others get under other headings, and where different, the concession is actually a step on the way to universal free compulsory education for everyone. In the area of those economic benefits that are of such great importance to so many people, we have already seen that most of the time it is the Scheduled Castes who pay the price: in exchange for a small benefit under a "SC Welfare" heading they are, in effect, deprived of much more substantial assistance under a general heading.

The middle-class level of provisions presents an intermediate situation, in which the benefits do seem to have produced results, others may be giving up something so that the Scheduled Castes can have their share, but the arrangement is generally accepted by public opinion. In a situation of scarcity where there are so many more qualified people than there are jobs, it seems to be accepted as reasonable that these be distributed according to communal and other pressure groups. There are grumblings and grievances expressed here and there, but as noted already, the pressures in the situation are to cut more and more groups in on the deal. Thus in recent years there have been more and more agitations to grant more benefits to "Other Backward Classes", to show more preferences for native sons rather than outsiders, and so on. The politicians who make policy and influence its implementation must become practitioners of the fine art of "distributive justice". Where successful, they derive their own political benefit from it.

At the elite level, like the lower class, we have a case where the benefits on paper differ from those in practice, where the distributions are far less than they are believed to be, but

unlike the lower-class level, there is strong hostility expressed in public opinion. In other words, the general public in the class concerned believes itself to be paying a far greater price than it actually is. Since this is an articulate class, the vocal protests (to *say nothing of the covert resistance*) against the alleged injustices are loud and continuous. This is where we are given the argument that the SC beneficiaries are not really "backward". If they were they would not be in a position to apply for admission to medical and engineering colleges or posts as Class I probationers in the first place. This is also where we are told that after all what is needed among doctors, engineers, and top decision-makers is competence, the implication being that if such a person is Scheduled Caste he must be incompetent.

This is also where we hear innumerable tales of persons being deprived of appointments in favour of people who ranked lower than they did in the relevant examinations. No doubt this does happen, but if all these people were, in fact, paying the price for appointments to Scheduled Castes, there would be many more SC persons appointed than there actually are. To illustrate: supposing that 300 people qualify for ten posts available. The top nine are appointed on merit but the tenth is reserved, so the authorities go down the list to find a SC applicant. They find one at number 140 and he is appointed. Whereupon all 131 between him and the merit list feel aggrieved. He has not taken 131 posts; he has taken one, yet 131 people believe they have paid the price for it. Moreover, the remaining 159 often also resent the situation, believing that their own chances were, somehow, lessened by the existence of SC reservations.

What is the Price?

Most analyses of this system address themselves at some point to the question of what price is paid for it. Our material suggests that the price actually paid may be different from what is commonly cited. I suspect that the heaviest price is not that it perpetuates the stigma of untouchability by forcing benefit-seekers to call attention to their caste status. This has always loomed much larger in the writings of sociologists than in the statements of the scheduled Castes themselves. Nor is it that it encourages weakness and dependency on the part of recipients and introduces incompetence and corruption into public life, as so often asserted in editorials and private conversations. Such assertions can be treated with a good deal of scepticism. The main problem may well be that it introduces complacency and resentment into public life which are injurious to the Scheduled Castes.

I said at the outset that there were three political actors: the category of potential beneficiaries, those who feel threatened by the system and oppose it, and those in power who adopt it for their own reasons. There is a fourth, non-active category: those non-beneficiaries who do not oppose the system and may be vaguely supportive of the government's policies. What seems to have happened over time, with the widespread belief that the system is showing much more favouritism to the SM than it actually is, is that this category has increasingly joined the opposition. Such people acquiesce in the system but feel increasingly resentful of what they think it is doing.

In the course of my visits to India over two decades I have noticed an erosion and virtual disappearance of a liberal-minded public opinion supporting private efforts to improve opportunities for the SC. Of course, educated people are against untouchability itself. But the kind of people who might have translated this into action to assist SC individuals and support private programmes are inactive now, on the ground that government is doing it all and nothing more needs to be done. As for everybody else, I find varying degrees of resentment and resistance, reinforcing whatever caste prejudices they may also feel. In the circumstances, one can understand the apprehension expressed by Scheduled Caste leaders that if the system is abolished there will be a wave of reaction and they will lose what little they have obtained.[16] This problem may be built into any system of so-called "preferential treatment" wherever it occurs in the world, but it seems particularly marked in India today. The price paid in public opinion — the animosities, mistaken beliefs, and their behavioural consequences — may be the greatest price of the system, and it is being paid by the Scheduled Castes.

Notes

1 SC and ST figures are from the 1971 Census. OBC comment is in the nature of a "guesstimate" based on extrapolations from earlier censuses of communities still on the OBC list (Nomadic and Seminomadic and former Ex-Criminal Tribes on lists of several states, Non-Brahmin communities still on the BC lists in the South, early OBC lists published elsewhere) and estimates of those religious converts from the SC and ST who are entitled to BC benefits in certain states. In the early 1960s this OBC category was about equal in size to the Scheduled Castes, but now, with revision and reduction of various lists, it appears to be less than half that size. On the legal history of this category, see Marc Galanter, "Who Are the Other Backward Classes?", *Economic and Political Weekly (EPW)* XIII : 43-44 : October 28, 1978 . 1812-28.

2 Dushkin, Lelah, 1961. "The Backward Classes", *Economic Weekly* XIII : Oct 28, Nov 4, 18 : 1665-68, 1695-1705, 1729-38.
—— 1967. "Scheduled Caste Policy in India: History, Problems, Prospects", *Asian Survey*, VII : 9 ; September: 626-36.

4 Innumerable articles might be cited in support of this point. To give but one illustration, see V T Rajshekhar Shetty, "Reservations Blessing or Curse?" *Sunday Statesman Magazine*, February 19, 1978 He expresses similar opinions in portions of his book, "Dalit Movement in Karnataka" (Bangalore: Christian Literature Society, 1978)

5 M Subbaiya in *Proceedings of the Mysore Representative Assembly*, Oct 1921, 102-103.

6 The phrase was used with precisely this meaning by the present Chief Minister of the State, Devaraj Urs, in 1972. (*Deccan Herald* February 6, 1972). The Durbar's phrase was used in the name of the committee appointed in 1918 whose report led to Mysore's basic BC policy document, a GO issued in May 1921, namely, "Committee Appointed to Consider Steps Necessary for the Adequate Representation of Backward Communities in the Public Service", Sir L C Miller, Chairman. The phrase is used several times in the Report (1919) and later documents.

7 Class IV also includes sweepers and scavengers, but the Scheduled Castes do not need any reservations for these jobs because nobody else will do them. Thus, when Class IV figures are computed, the sweepers and scavengers are normally excluded.

8 Mysore's reputation as a "model state" was built largely by good public relations and by investments in the towns. The rural areas were relatively neglected as regards many items of economic development and social overhead. This imbalance in the state's priorities was a constant theme of Congress rhetoric during the 1930s and

1940s in Mysore. See Dushkin, *op cit*, 1974, esp chapters 1 and 6. See also James Manor, "Political Change in an Indian State", Mysore 1917-1955. Australian National University Monographs on South Asia No 2 (New Delhi; Manohar Books and Columbia Mo; South Asia Books, 1977), passim.

9 The largest such caste groups were the Kuruba shepherds (nearly 7 per cent of the state's population) and Beda "hunters" (nearly 5 per cent). Also aggrieved were several relatively small (1 to 2 per cent of the population) communities such as the Vodda earth-workers, Yadava cowherds, Uppara saltworkers, Agasa washermen, and Lambani "gypsies". See Dushkin, *op cit*, 1974, 302-304. For an example of the communal understandings which had developed, see the data on the distribution of merit and BC reserved seats in Mysore Engineering Colleges cited in the law case, *Vishwanath* vs *State of Mysore*, AIR, 1964, Mysore 132 at 137, 139.

10 Devaraj Urs in *Deccan Herald*, February 6, 1972.

11 L G Havanur, Chairman. *Deccan Herald*, October 31, 1972. The Commission's Report was published in four large volumes in 1976. See esp *Indian Express*, April 28, 29 and 30, 1976, and *Deccan Herald*, May 18 and 19, for its major recommendations and its political reception. Also both papers, November 20, 1975. Havanur is now the Law Minister of Karnataka.

12 *Deccan Herald*, *Deccan Chronicle*, and *The Statesman*, August 9, 1967.

13 The detailed caste data on educational enrolments during the 1940s and 1950s are summarised in Dushkin, *op cit*, 1974, 289-296. A comparison of the communal distribution of government jobs just before and just after States Reorganisation at the end of 1956 is instructive; there is almost no change in Brahmin-Non-Brahmin proportions, yet the major group of officials to join Mysore came from the Bombay districts, where there had been few if any reservations for BC, compared to princely Mysore, where there had been many.

14 *RCSCST* for 1973-74, p 83.

15 Chandidas, R, "How Close to Equality Are Scheduled Castes?", *EPW*, IV: 24: June 14, 1969: 975-980. See also the discussion of Chandidas' data in R A Schermerhorn, "Ethnic Plurality in India" (Tucson: University of Arizona Press, 1978) pp 55-58. P C Aggarwal and M S Ashraf, "Equality Through Privilege: A Study of Special Privileges of Scheduled Castes in Haryana" (New Delhi: Shri Ram Centre, 1976) p 125.

16 The reference to Karnataka is derived from my own observation during the year 1975-76, numerous Press clippings and interviews, as well as correspondence since my departure. James Manor discusses related matters in: "Structural Change in Karnataka Politics", *EPW*, October 29, 1977: 1865-1869; and "Where Congress Survived: Five States in the Indian General Election of 1977", *Asian Survey*, XVIII: 8: August 1978: 785-803. For Andhra Pradesh, see the Governor's address to the Legislature reported in *Deccan Chronicle*, March 22, 1977. This picture is supported by field observation in one reserved constituency by Janet Benson, personal communication 1978 and "Political Activity in a Parliamentary Constituency of Andhra Pradesh in the 1977 General Election: Why Congress Won", *Asian Survey* XVIII: 8: August 1978: 804-816.

17 Aggarwal and Ashraf, *op cit*, 1976, pp 168-173.

18 The reaction may already have begun, with or without the removal of SC reservations and other benefits. *Cf*, *New York Times* February 18, 1978 on the vengeance being taken since the ouster of Indira Gandhi and victory of the Janata in the North. The Indian Press is full of items of escalating rural violence against Scheduled Castes, to say nothing of the periodic urban riots over BC benefits, the caste-communal implications of renaming a university, and so on.

Union Budget, 1979-80

B B Bhattacharya

The Central government Budget for 1979-80 is conservative as far as public investment and resource mobilisation are concerned. The additional taxation measures are designed more to make up for the loss of revenue on account of concessions granted to a certain class of the rural population than with any overall objective of resource mobilisation.

Given the political and economic conditions prevailing in the country today, some of these features of the Budget are likely to retard the process of long-run growth with social justice and, therefore, need serious consideration.

THE Union Budget for 1979-80 seems to be more concerned about the transfer of resources between different segments of the private sector than about the overall resource mobilisation for planned development. Even if we ignore the usual ritualistic excitement about increases and decreases in tax rates on various commodities, we cannot ignore some of the long-term implications of the budget. However, it may be mentioned at the outset that the basic features of the budget like the attempt to shift production as well as benefits of development more and more to the agricultural from the non-agricultural sector have been inherent in some previous budgets as well. This budget has only accentuated these tendencies with consequent implications. Nevertheless, given the political and economic conditions prevailing in the country today some of these implications may retard the process of long-run growth with social justice and, therefore, they need serious consideration.

The main features of this year's budget are: (a) additional taxation worth Rs 665 crores mainly through increases in excise and customs revenues; (b) major tax concessions on various agricultural inputs like fertiliser, light diesel and power tiller; (c) no basic change in income tax structure, particularly corporate tax structure, except for reduction of tax concessions for long-term saving and investment in the organised sector; (d) increase in tax concessions for agricultural credit and investment as well as further direct and indirect tax concessions for agricultural income from the cultivation of tobacco, mushrooms, etc; (e) further increases in agricultural and non-agricultural subsidies with no efforts to control them; and (f) large-scale deficit financing in spite of a high dosage of additional taxation, and modest increase in Plan size.

TABLE 1: TRANSFERS FROM CENTRE TO STATES

(Rs crores)

Year	Transfers through Finance Commission		Plan Assistance		Other Transfers	Total Transfers	
	Amount	Per Cent (a)	Amount	per cent (b)	Amount	Amount	Per Cent (c)
1974-75	1730	27	1112	30	478	3320	37
1975-76	2118	28	1428	30	546	4092	30
1976-77	2206	27	1756	35	737	4699	30
1977-78	2400	27	2576	44	743	5719	34
1978-79 (Revised)	2646	26	3692	50	1542*	7880	40
1979-80 (Budget)	3688	32	2967	41	956	7611	37

* Includes Rs 555 crores as special grant for clearing state government overdrafts on 31-3-1978.

(a) Per cent to gross tax revenue of Centre including states' share.

(b) Per cent to gross capital formation out of budgetary resources of the Centre.

(c) Per cent to gross revenue and capital receipts of the Centre (inclusive of states' share in tax revenue).

CENTRE-STATE TRANSFERS

Before we analyse the implications of all these features let us turn our attention to one factor, namely, the recommendations of the Seventh Finance Commission, and its effects on Central government revenue, expenditure and budget deficit. The Seventh Finance Commission has recommended much larger devolution of Union taxes to states, increasing their total share of the net divisible proceeds of income tax from 80 to 85 per cent and of basic excise duties from 20 to 40 per cent, except the electricity duty introduced in last-budget which is to be transferred 100 per cent to states. The Commission has also recommended much higher grants for relief of natural calamities as well as for debt relief. As a compensating factor the Commission allocated a smaller amount for statutory grants-in-aid from Centre as all but eight small states were expected to cover their revenue deficit through additional tax receipts from Centre. The transfers from Centre to states as per Seventh Finance Commission recommendations in 1979-80 budget is Rs 3,688 crores, which is substantially higher than Rs 2,646 crores as per the revised estimate for 1978-79. Transfers from Centre to states as a proportion of the gross tax receipts of Centre are 32 per cent in 1979-80, the first year under the Seventh Finance Commission recommendations. During the Sixth Finance Commission period, 1974-75 to 1978-79, the proportion varied between 26 and 28 per cent.

However, it would be improper to analyse the burden on the Central budget in terms of the direct effect alone. Total financial transfers from Centre to states consist of: (a) transfers through Finance Commission, (b) transfers for state Plan expenditure — Central and centrally sponsored schemes as well as state plan schemes —, and (c) other non-Plan transfers, including overdraft facilities. The Finance Commission's recommendations do not affect other transfers directly, but they indirectly influence the volume of such transfers, for Centre takes an overall view of the financial needs of the states in budget allocations. When the Finance Commission awards larger devolution of resources to the states, the Centre's commitment to provide assistance for Plan and non-Plan expenditures of states declines as states are expected to be more self-sufficient financially. In this year's budget as against an additional devolution through the Finance Commission worth Rs 1,042 crores, Central assistance for state Plans declines by Rs 725 crores, entirely on account of state Plan schemes. The total transfers budgeted this year is Rs 7,611 crores which is about 37 per cent of gross tax and non-tax revenue of the Centre (revenue plus capital account). The revised estimate of transfers in 1978-79 is Rs 7,880 crores (including Rs 555 crores as special grant for clearing overdrafts) which is 40 per cent of the revised estimate of gross revenue in 1978-79 (37 per cent excluding special grant). In the earlier period covered by the Sixth Finance Commission recommendations this proportion varied between 30 and 37 per cent (Table 1). Even if we take states and union territories together, the total net transfers (net of recoveries of loans) in 1978-79 and 1979-80 are Rs 6,532 crores (excluding special grant) and Rs 6,938 crores, respectively. The ratio of net transfers to gross receipts of Centre comes out to be 33.5 and 33.6 per cent, respectively, indicating almost no change. Therefore the overall impact of Seventh Finance Commission recommendations on the Central deficit financing in the first seems to be negligible.

The actual deficit financing of the Centre may still be larger than what is budgeted. Budgets for 1979-80 of 10 important states presented so far do not show any substantial effort at resource mobilisation. Nor do they show enough revenue surplus as anticipated by the Seventh Finance Commission. Several of them are still showing revenue deficits apart from overall deficits on revenue and capital accounts. This would definitely put additional burden on the Centre either for increasing Central assistance for state Plan schemes (or transferring some of them to Central account as suggested as a compromise) or grants and loans for state government overdrafts. If neither of these happens then actual Plan outlay by states may go down, leading to a reduction in the real content of the draft Plan 1978-83.

RESOURCE MOBILISATION

Let us now turn to the basic features of the budget. Various new tax proposals are expected to yield an additional net tax revenue worth Rs 665 crores, the highest budgeted so far. As a proportion to gross tax revenue, this is however far short of some of the previous efforts — 5.8 per cent against 13 per cent in 1971-72 and 7 per cent in 1974-75. Considering that the industrial climate is now much more optimistic than in the last few years the additional tax resource mobilisation does not seem to be very impressive. Not only tax but domestic non-tax resource mobilisation this year is no better than last year as would be revealed by Table 2. Measurement of resource mobilisation through Central budget should not be judged in terms of aggregate national income alone, but also in terms of various other factors like the aggregate saving ratio, domestic saving-investment gap and the relative growth of agricultural and non-agricultural output. Almost all these factors are now much more favourable than before. Aggregate saving ratio (gross) has continued to increase in the last few years, thanks to large scale foreign exchange remittances, and now stands at approximately 23 per cent of GDP. As against this, gross domestic investment ratio stands at 21 per cent — two percentage points short of the saving ratio (*Economic Survey, 1978-79, p 65).* It would have been more appropriate for this budget to boost public investment substantially to bridge the gap between domestic saving and investment

TABLE 2: DOMESTIC RESOURCE MOBILISATION BY CENTRE

(Per Cent of National Income)

Year	Tax Revenue	Non-Tax Current Revenue	Market Loans	Small Savings, Provident Funds and Other Funds	Total
1970-71	9.3	2.6	0.4	1.9	14.2
1971-72	10.5	3.0	0.8	1.5	15.8
1972-73	11.2	2.8	1.2	1.1	16.3

through additional resource mobilisation, but not necessarily through taxation. Non-tax resource mobilisation measures this year are rather disappointing. In fact, except for the continuation of the Compulsory Deposit Scheme, which would yield an additional revenue of Rs 160 crores, no other significant non-tax resource mobilisation measure is proposed in this budget.

Another factor needs to be highlighted in this context is that as against Rs 7,750 crores additional tax receipts proposed for the Centre during the period 1978-83, about Rs 5,000 crores are already realisable in terms of additional tax measures taken during the first two years. Last year's additional tax proposals would yield about Rs 2,400 crores over a period of five years while this year's proposals may add another Rs 2,600 crores over the next four years, which means about two-thirds of the potential increase in tax receipts during the Draft Plan 1978-83 is already accounted for by the first two years' budgets. As against this the real Plan outlay of the Centre, states and union territories in the first two years is only about Rs 23,500 crores (in terms of 1977-78 capital goods price) which is about one-third of the target for the entire Plan period — Rs 69,380 crores. In other words, Plan outlay in the public sector is not keeping pace with the additional taxation in the Central budget. If the Draft Plan 1978-83 public sector Plan outlay is to be fulfilled, then even further tax and non-tax efforts are necessary on the part of the Central government. This is further strengthened by the fact that as against the Draft Plan target of additional tax resource mobilisation by states of Rs 5,250 crores, so far states have mobilised not more than Rs 500 crores in the first two years — about Rs 70 crores by all states in the first year yielding Rs 350 crores in the five years and about Rs 30 crores by 10 major states in the second year yielding about Rs 120 crores in next four years. Since the Centre plays the key role in overall fiscal policy of the nation, the burden on the Central budget of additional resource mobilisation is likely to be greater than stipulated in the Draft Plan. Failure to do this would imply a drastic cut in real content of the Plan with corresponding adverse effects on growth of income and tax as well as non-tax revenue. The fall in revenue would lead to either rise in deficit financing or further reduction in Plan outlay. If deficit financing is carried beyond a limit then it would reduce the real value of the investment through the inflationary mechanism. Either way, the system would be caught in a vicious cycle of low public investment, low income, low tax and non-tax revenue and back to low public investment.

PRO-RURAL SHIFT OF INCOMES

A particularly disturbing element in this context in this as well as in the last few years budgets is the attempt to shift production and income more and more towards the rural sector without any corresponding effort at resource mobilisation from the agricultural sector. At present the bulk of resources for public investment is mobilised from non-agricultural income. Public investment is, however, needed not only for non-agricultural but also for agricultural sector development. In fact, much of the recent development in the rural sector, particularly the introduction of new technology, has originated from public investments in irrigation, fertiliser, pesticides and various other facilites. Need for such investment has not diminished; in fact it will grow over the years. If rural sector has to develop faster with corresponding increases in public investment in that sector then it implies that either overall resource mobilisation has to be stepped up or investment in the non-agricultural sector has to be reduced relatively. The latter option has some serious implications and it may not help long-run balanced growth of agricultural sector itself.

Critics of agricultural taxation usually put forward the argument that the disparity of agricultural income is smaller than that of non-agricultural income. With a relatively larger population depending on agriculture for their livelihood, the taxable surplus for direct taxation is relatively low. Further, they add that direct and indirect taxation of agriculture is not very small in comparison to the benefit from public expenditure in the rural sector. Direct taxation of agricultural income has limited scope and may be operationally very difficult. The Raj Committee, after an elaborate exercise, confirmed this view. Similarly, it may be also conceded that per capita public expenditure in the rural sector — developmental as well as non-developmental — is smaller than in the urban sector.

Benefits from recent agricultural development, particularly through the adoption of new technology, have not been evenly distributed among all income earners. By and large, big farmers with relatively greater resources, either in terms of direct ownership or in terms of indirect control through the lop-sided institutional structure, have reaped relatively larger benefits. Over the years the disparity of income in rural sector has, therefore, increased. The disparity has also increased as between regions. As we know, the new technology is used more intensively in the wheat cultivating area of the northern-agricultural belt. The marketable surplus in this area has, therefore, increased relatively faster than in other areas. A comparison of state-wise public procurement of foodgrains wefore and after the introduction of the new technology would confirm this.

The present as well as some previous budgets, instead of trying to mobilise some of these surplus resources from the agricultural sector, particularly

from the relatively prosperous farmers, have given further direct and indirect tax concessions to them. The agricultural sector's contribution to Central revenue is mainly through indirect taxation of agricultural inputs and other finished products consumed by agriculturists. Direct tax as well as non-tax revenues from agriculture are insignificant. Public sector undertakings dealing with agricultural inputs hardly make any profit. More often they make heavy losses putting a further burden on the Central budget. Excise and custom duties on agricultural inputs and other products consumed by them become the basic source of resource mobilisation from agriculture. The present budget has announced substantial tax concessions on various agricultural inputs — fertiliser, power tiller, low speed diesel, etc, adding up to a net revenue loss of more than Rs 100 crores (fertiliser alone would contribute Rs 76 crores excise and Rs 30 crores customs of this revenue loss). Subsidies on fertiliser would also go up by another Rs 150 crores. Total subsidies on food and fertiliser alone would now exceed Rs 1,000 crores or about 10 per cent of total current revenue of the Centre. Excise on tabacco and income tax on income from mushroom cultivation have been completely withdrawn, adding further to revenue loss. In addition some direct tax concessions have been announced for rural investment, like donation for rural development, exemption for commercial bank loans to agriculture with a high possibility of bad debt.

BIG FARMERS MAIN BENEFICIARIES

The crucial question is who are the main beneficiaries of these concessions. Rural society is not homogenous. It can be broadly divided into: (a) big farmers, (b) small farmers, and (c) landless labourers and artisans, blacksmiths, etc. Fiscal concessions hardly benefit labourers. Some small farmers may benefit from reductions in taxes on power tiller and fertilisers. However, bigger farmers, being more intensive users of subsidised inputs would benefit more. Table 3 shows use of fertiliser in rice cultivated area by size of holdings. It may be observed that on an average application of fertiliser per hectare is highest in the biggest size of farm. Reductions in fertiliser price would benefit proportionately large farmers more *vis-a-vis* small farmers. For all crops, use of NPK (kgs per hectare of gross cropped area) in 1976-77 was 20.1 for all India; but for Punjab it was 61.6, Haryana 26.6 and UP 31.7, which shows that at the regional level also the tax concession would have differential impact.

The excise on fertiliser has been continuously reduced since 1975-76, such that after the recent budget concession, the effective price of fertiliser would stand more or less at the same level as that in 1974. Procurement price for foodgrains in the meantime has increased steadily. The input-output price relationship for foodgrains cultivation has thus become more favourable for farmers. Bigger farmers with relatively higher proportion of marketable surplus would benefit more at the expense of food consumers through these fiscal changes. Domestic as well as import costs of fertiliser also increased during this period, resulting in more subsidies and further transfer of real resources to big farmers.

The regional aspect of this transfer of resources also needs serious consideration. The benefits of public expenditure in rural areas are not distributed evenly between states and regions. Given the present economic and institutional set up, benefits of public expenditure in rural areas would also be concentrated in already developed areas. It is essential, therefore, that to develop relatively backward agricultural areas, income generated from public investment — direct as well as indirect, subsidies, etc — in relatively prosperous agricultural areas should be rechannelled into the public exchequer for further investment. This should be done, if not by direct taxation, but by other measures like gradual reduction in tax concessions and subsidies, and introduction of borrowing measures for mopping up rural saving.

Another aspect which needs to be considered seriously is the choice between *increasing public expenditure in* rural areas in the form of loans to small farmers for purchasing inputs or direct capital transfers for investment by small farmers *versus* general increase in subsidies and tax concessions on agricultural inputs. From the budgetary angle both would increase expenditure without any increase in revenue; however, the former has an advantage over the latter in that it can be directly related to the welfare of small farmers and the landless class by judicious selection of schemes, while the latter may benefit more rich *vis-a-vis* poor farmers. The Finance Minister could have increased public expenditure in rural areas on selective projects which benefit poor farmers instead of reducing excise on fertiliser, etc. This way he could have served the interests of the rural poor better.

RELIANCE ON INDIRECT TAXES

As far as additional taxation is concerned this budget has relied heavily on indirect over direct taxation. Out of Rs 665 crores net additional taxation, Rs 606 crores would come from excise (Rs 455 crores) and customs (Rs 151 crores). The ratio of indirect tax to additional tax receipts works out to be about 92 per cent, substantially higher than the ratio in the total (74 per cent). Out of the remaining, Rs 54 crores may come from income tax and Rs 4.5 crores from corporate tax.

The gross additional tax receipts from excise and customs is Rs 756 crores, against which there are reductions in excise and custom duties on various items amounting to Rs 150 crores. Excise cut on fertiliser and corresponding countervailing effect on customs duty alone contribute Rs 106 crores to the revenue loss. Other major items contributing to revenue loss are light speed diesel, half the consumption of which is in agricultural sector, and drugs. If we include additional excise worth Rs 116 crores imposed on tobacco manufacturers to compensate for the complete exemption of excise on tobcaco cultivation, the total indirect taxation of non-agricultural output is about Rs 875 crores.

A commodity-wise breakdown of indirect taxes shows that roughly Rs 321 crores have been imposed on consumer and consumer durables, Rs 198 crores on intermediate and capital products

Table 4: Percentage Distribution of Public Sector Plan Outlay

	5th Plan	Draft Plan 1978-83	1978-79 Budget	1979-80 Budget
Agriculture and allied	11.8	13.7	15.0	15.0
Irrigation and flood control	8.7	11.5	10.0	10.0
Power	17.9	22.7	18.9	19.5
Village and small industries	26.0	2.0	1.9	2.3
Industry and minerals		19.2	20.7	20.0
Transport and communication	17.5	15.3	15.4	17.0

Welfare of backward classes	1.7	2.0	1.9	0.75
Education and scientific research	4.3	3.7	4.8	2.2
Health and family planning	3.0	3.0	3.3	3.1

and about Rs 242 crores on unspecified items, details of which are not readily available. Relatively greater reliance on consumer in comparison to intermediate and capital goods is a welcome change from last year's budget which relied heavy on intermediate products, notably coal and electricty. Indirect taxes in general are carried forward, pushing prices. Manufacturing output prices in India are determined more by cost push than by demand factors. In the case of indirect taxation of intermediate products, the increase in the final product price - is much higher than the initial rise in intermediate product due to cascading of taxes at different stages of production. The inflationary impact in terms of cost push through indirect taxation as a result of this budget may be less in comparison to the last year's budget; however it may still be quite significant. Even if we assume that at least Rs 100 crores of the additional revenue from unspecified commodities would come from intermediate products, then the total additional taxation of intermediate products would be of the same magnitude as last year. In addition there would be the additional indirect tax burden on consumer goods. The rise in indirect taxation of intermediate product as well as increase in railway goods freight charges may push up the prices of manufactured products next year, though, on a quick assessment it does not seem that such price rise will be very large.

After changes in excise duties, collections from various broad groups of commodities would rise as follows: food and beverages by Rs 13 crores or 5 per cent of earlier tax receipts; tobacco Rs 55 crores or 11 per cent, petroleum products Rs 210 crores or 16 per cent; jute and textile manufactured goods Rs 10 crores or 1 per cent; other manufactured goods Rs 4 crores or 1 per cent and machinery and transport equipment Rs 45 crores or 8 per cent. Collections from metal and metal products as well as from vegetable oil and fats would be unaffected, while collections from chemicals would go down by Rs 33 crores or by 6 per cent. Collections from unspecified items would go up by Rs 106 crores or by 60 per cent. In the case of customs, collections from petroleum products and unspecified items would go up by Rs 56 and Rs 96 crores, respectively, as a result of countervailing effects of increase in excise duties, while collections from chemicals would fall by about Rs 36 crores. One area in which there is considerable scope of additional taxation is the consumer durables sector. The total collection of excise on various consumer durables at the last year's rates is about Rs 200 crores. Changes in excise duties this year may push it up by Rs 16 crores or about 8 per cent, which is very marginal. Consumer durables are now purchased significantly in prosperous rural areas. Besides a large proportion of such purchases in urban areas is paid for through unaccounted incomes. A further increase in excise duties on consumer durables, with corresponding improvement in tax machinery, would have mobilised a significant amount of revenue from both urban and rural areas without any adverse effect.

The budget makes marginal changes in corporate and non-corporate income tax rates. For the corporate sector changes in tax rates at various slabs would be insignificant. For non-corporate income tax the highest marginal rate goes up from 69 to 72 per cent. The highest marginal income tax rate, which had been reduced from the one-time peak of 97 per cent to 66 per cent two years back, was pushed up to 69 per cent last year. Increase in income tax rates without corresponding improvement in tax collection machinery leaves net collection unchanged. This is confirmed by many theoretical and empirical studies. A problem may arise from the reduction in tax concessions on long-term investment in organised sector and increase in tax concessions for investment in the unorganised sector. The revenue implications for such concessions are not very significant in the short-run, but they have long-term implications regarding resource allocation. At present income-tax concessions are given for reinvestment of capital gain in long-term approved securities. Withdrawal of tax concessions may not only affect revenue by way of underreporting, but may also divert resources underground. Each illegal transaction gives rise to another and a vicious cycle of black income and wealth may originate from this. Further, since tax concessions are now extended for some rural investments like donations for rural development which are very easy to manipulate, a chain reaction of illegal income and wealth transactions may follow from this budget. Growth of illegal income not only affects government revenue but also distort resource allocation.

Plan Outlay

This budget virtually makes no change in Plan allocation between sectors. The total Plan outlay of Centre, states and union territories shown in the Central Budget for 1979-80 is Rs 12511 crores against Rs 11649 crores in 1978-79. This marks an increase of about 7.4 per cent at current prices. If next year's Plan outlay is deflated by increase in capital goods price in 1978-79, approximately about 5 per cent, the real increase in Plan outlay is only about 3 per cent. The Plan outlay in the current budget is however underreported by reclassification of expenditure of about Rs 835 crores. Even if we adjust for this, the real increase in Plan outlay is about 9.5 per cent. The last few years' budgets had made much larger increases in Plan outlay. Considering this, this year's budget seems to be very conservative, particularly in view of the fact that

with this Plan outlay the total in first two years of the Draft Plan 1978-83 would be only about one-third of the total outlay of Rs 69380 crores for the five years.

As regards sectoral allocation, this budget does not make any significant change in comparison to the last year as would be seen from Table 4. The noticeable changes in sectoral allocation are not in regard to agriculture, irrigation and allied sectors. There is a relative increase in outlay on village and small industries in comparison to industry and minerals. Allocations for power, transport and communication, water supply and sanitation have all gone up at the expense of health, education and welfare of backward classes. If Plan allocation is any indication then there seems to be a distinct bias against long-term infrastructural facilities and welfare measures in urban areas without any significant attempt to cut the growth of the large-scale manufacturing sector, as feared in some circles earlier. However, it may be mentioned here that the budget, cannot alter significantly the sectoral allocation of Plan outlay without concurring support from the Planning Commission. To that extent the revealed bias in this budget may not reflect the true bias of the budget-maker.

Inflationary Impact

Several critics of the budget have highlighted the possible adverse impact of deficit financing of Rs 1355 crores in spite of heavy additional taxation. Like additional taxation the absolute amount of deficit financing is the highest budgeted so far. The fear of this amount of deficit financing causing large scale inflation is however exaggerated. The absolute amount of deficit financing should not be treated as the yardstick to judge the inflationary content of the budget. The proportion of total expenditure to be financed through deficit financing in 1979-80 is about 7.3 per cent. The revised estimate for 1978-79 puts it at 8 per cent. Actual deficit financing in 1979-80 may be larger than budget provision for various reasons. First, government expenditure in general rises faster than revenue, leading to a wider gap, as has happened so often in the past. Secondly, post-budget indications regarding increase in salary and wage bill on account of price rise and deficits in state budgets also suggest further rise in Central deficit financing.

The concept of deficit financing used in the Central budget is misleading from the point of view of monetary expansion. Deficit financing as defined in the Central budget refers to direct expansion of currency plus government's short-term debt to the banking system. Government's long-term debt to the banking system in terms of rupee securities are clubbed under market borrowing. The monetary expansion, or more appropriately high-powered money expansion, is consequently usually larger than the amount of deficit financing. On the other hand, if governments deficit expenditure arises in relation to foreign payments — government import bill and foreign debt repayment being higher than net foreign exchange receipts on account of aid and capital transfers — then high-powered money would decline even though deficit financing may be positive. The exact composition of government's transactions with banking system, particularly, regarding the foreign exchange, is not published. One has therefore, to guess the monetary expansionary effect of total deficit financing.

Assuming a money multiplier equal to 1.8 (average for the last few years), Rs 1,355 crores of deficit financing has a potential of increasing money supply by Rs 2,439 crores which is about 12 per cent of the outstanding money stock in January 1979. If a part of the deficit financing is used for foreign exchange payment then the actual rate of growth of money may be even less. With lesser expectation of external financing in 1979-80 as compared to 1978-79, the government's foreign exchange liability is going to be comparatively higher. The monetary expansionary effect of this budget is therefore not very high, particularly if we consider actual rate of growth of money in the last few years. The rate of growth of money supply in 1975-76 was 11.3 per cent and in the following years 20.3 per cent, 14.7 per cent and 12.0 per cent, respectively.

The last few years experienced relative price stability in spite of the fact that money supply increased much faster than real output. This has belied the expectations of all old fashioned quantity theorists. A clue to this riddle may be found in a structural analysis of inflationary behaviour in India. When agricultural output, particularly that of foodgrains, rises faster than non-agricultural output, prices of agricultural commodities are depressed. Further, if the purchasing power of the main food consumers, rural and urban labourers, fails to keep pace with foodgrains growth, food prices as well as the general price level remain stable. This is the main reason why in the last few years prices remained stable in spite of big gaps between growth rates of money supply and aggregate output. Given the current rate of growth of money supply, food stock with government and expected growth of agricultural and non-agricultural output, the inflationary potentiality of the budget is not very high.

To sum up, the Central government budget for 1979-80 is rather conservatives as far as public investment and resource mobilisation are concerned. The additional taxation measures are designed more for compensation of revenue loss on account of concessions to a certain class of rural people than with any overall objective of resource mobilisation.

Record Growth in Priority Sector Advances

Renewed Commitment for Rural Development and Employment Generation

Shri P.C.D. Nambiar, Chairman of the State Bank of India, stated at the 24th Annual General Meeting at Kanpur on March 30, 1979, that there was a record growth of Rs. 379 crores in advances to the priority sectors in 1978. He added that measures launched in earlier years for promoting rural development and entrepreneurship and for providing equity support to small entrepreneurs were expanded and intensified. So were those for the enlargement of employment opportunities both in the urban and the rural areas.
